Bumper Fruit Crop at Record Prices.

Written for Pacific Rural Press by John J. Fox.

MINIMUM PRICES on pears, freestone peaches, apricots, figs and prunes are established by the opening prices of the Associations on dried fruits. The amount to be shipped or canned will still depend on the prices the market is willing to offer above this relative basis. And that market is governed by supply and demand for fresh or canned fruits.

For instance, at an average price of 15 cents for dried Muir peaches, it would not pay to sell them green for less than \$55 a ton in lugs. Clings are selling at \$90 up. With dried pears at 18 cents, green Bartletts would command an average of from \$65 to \$70 in lugs—more in Lake county where a special article is turned out and so on. Any prices beyond such averages would tempt more men to ship to the packers or canners.

The absence of heat through spring and early summer has been conducive to improved quality in all fruits, in lessening June drop and in deferring early ripening. Cherries have brought unheard-of prices, as high

Berries—The acreage in berries is about the same as last season, and the yield is fully as good as last year's to date. The bush berries look better than last year, and with as favorable a season the yield in the Sebastopol region may run 10 per cent over the crop of 1918 on the same acreage.

Pears are at least 10 per cent better than last year and they are exceptionally clean and of good quality. Never have pears been so well sprayed and so free from scab.

Peaches—Throughout the State are a banner crop. This crop is estimated to reach 450,000 tons of green fruit. Freestone peaches will also create a record in the dried product. This crop is practically assured.

Apricots—The sum total of this crop is now estimated at 150,000 green tons, or 85 per cent of a normal crop. The quality is excellent, except in the South, where little thinning has been done and the load of fruit is abnormal.

Prunes—The prune crop this year is expected to create a record in

These ten-year-old peach trees in the Hunt Bros. orchards at Linden are carrying an average as 15 cents a pound in unpacked 24-pound lugs has been obtained. The market for them has been very fluctuating though—the low point being 6 cents for soft cherries. This may have been due to a number of ripe ones being sent in, due to shortness of pickers.

Sixty dollars a ton doesn't seem to interest Malaga grape growers in the San Joaquin. They made such a clean-up last year that the future looks extra rosy. It is evident that this price is not based on the value of the dried article, but on an expected demand. The large shipments of this splendid grape last fall will doubtless have extended its patrons in the East. The present outlook is excellent—a 100 per cent crop.

Crop Estimates.

Citrus Fruits—From Butte to San Diego the promise for citrus fruits is excellent. There is a good summer crop of lemons. A heavy June drop is reported from Porterville, but an ample crop remains. The average June drop is not abnormal.

Olives—It is still a little early to give an estimate.

Raisins and Table Grapes—The Associated Raisin Company estimate this year's crop at a possible 200,000 tons of the cured article or 100 per cent of a crop, allowing for the increased acreage in bearing this year—about 10,000 acres.

12-ton crop. This is a very even orchard of vase-shaped trees carrying fruit clear to ground. weight. One hundred and twenty-five thousand tons is spoken of by the Association as being probable. The new acreage accounts for part of the large increase. The June drop has been light and the fruit is in excellent condition.

Apples—All over the State apples are good the trees in A-1 condition and clean. White Astrachans are now being picked and packed. The State crop will amount to about 7,500,000 boxes.

Almonds—The Almond crop is very uneven—perhaps 75 per cent of normal. The quality, however, is excellent everywhere. Twelve million pounds is the expected yield for this year for the State.

Walnuts—The Walnut Growers' Association estimate that the State will produce 25,000 tons of walnuts this year—a full crop.

Labor Scare and High Priced.

Every fruit district is making what arrangements it can either individually or collectively for labor during the fruit harvests. The large growers are providing accommodations and every inducement to attract pickers for the short period they are needed and the canneries are doing the same. Grape men will be from 7,000 to 8,000 hands shy except for importation in the raisin district and some of the table-grape growers are arranging for the women who served in the Women's Land Army last year.

EDITORIAL.

PERMANENCY OF PEACE.

IT IS becoming very trite to say, in contemporary editorial preachments, that permanent peace must rest upon good will; still, not having previously delivered our pen of the sentiment, we must do it now—for fear of losing our place in the peace-pageant. We presume it is true; it is certainly old enough to be true. Good will was a congenital endowment of the human race, for the Creator, himself the supreme embodiment of good-will, made man in his own image, and pronounced his creation very good. It is, of course, difficult with our finite minds to see how this creative judgment was fully justified, for there was in the first Edenic generation—

"Murder most foul, as in the best it is;
But this most foul, strange and unnatural."

But it has also been always claimed that it was the potentiality of good will and the freedom to choose to develop it which made man godlike—not that he was made good against his will.

We are citing these familiar things because, so far as we can see, they constitute the only hope for permanency in the peace which was made last week. We do not know how much good will has ever been immediately manifested among those who made peace after a great war. It is possibly only to be expected that after this greatest of all wars there should be least of all good will at the end of it. Here are two declarations—one for the victors and the other for the vanquished, which seem to fairly represent the resources of good will on both sides at this moment:

"The treaty of peace has been signed. If it is ratified and acted upon in full and sincere execution of its terms, it will furnish the starter for a new order of affairs in the world. It is a severe treaty in the duties and penalties it imposes upon Germany, but it is severe only because the great wrongs done by Germany are to be righted and repaired; it imposes nothing that Germany cannot do; and she can regain her rightful standing in the world by the prompt and honorable fulfillment of its terms."—President Wilson's proclamation of peace, June 28.

"We are signing without mental reservation. What we are signing will be carried out. The German people will use every means to meet the terms. Germany will make every effort to prove herself worthy to enter the league of nations."—Declaration of Foreign Minister Mueller—German signatory.

There is no gladness of speech in these declarations. There was no gladness either of tongue or of hand on the occasion of signing of the peace-treaty to which they refer. The event was planned and pursued without opportunity for fraternization. It was simply the obsequies of Mars—with Mercury and Bacchus locked up in the guard-house. Will the peace be permanent? That depends upon the potentiality of good will in the hearts of men and of nations. It may grow and recreate the world. If such be the glorious consummation, coming generations may rejoice. Consciousness of having done what it conceived to be its duty to the world must compensate and comfort this generation for its sufferings and sacrifices.

THE OUTING SEASON.

With war's aftermath mown close to the clods by the peace treaty and with John Barleycorn interned by war-time prohibition until demobilization shall set him free for a short run before his final execution in January next, there seems nothing for the idle urbanite to do but to spin out upon the highways and seek diversion in the open country—with his boot-leg tanks well filled, for there will be no uplift in the things which the wayside service stations will set up. It was a great pleasure to many to return to the old California custom of going to the country before July 1, and the resorts on seashore, foothill and high mountain are better filled this year than since war-distractions began. The throngs of motorists who are going from one to another of them over the concrete highways will get some exhilaration from the thought that California will build forty million dollars' worth more of them—as was strongly voted at the special election on July 1. This additional inducement to tourist indulgences in California will round out our population, by compensation for the withdrawal of winter-residents, and demonstrate California's all-the-year desirability, to a development-advantage which it may be hard to overestimate. Those who are watching such things tell us that 600 overland-by-motor parties came to California in June, and that 200 California motors carried our own outing citizens on interstate runs. It is not too far-fetched to claim that the contact with so much fresh air will be a decided benefit to our classes of gilded Americans. Our population will surely have a tougher upper crust than in the old days, when gambling and gaming, in resort ball-rooms and casinos, were the fashionable summer recreations. It is also interesting to note that the overland railways are also beginning to function again in the popular interest, and that people are taking again to them as recreation adjuncts—much as they dislike government rates, regulations and reduced accommodations. Limited trains are running in two sections on all overland lines. The following statement from traffic observers is interesting:

Never in the history of the State has this business been so heavy, except during the 1915 summer of the Exposition. The railroads believe the number of tourists this summer will run over 50,000. During the first twenty-five days of June 16,820 tourists were brought here from Eastern cities and Canada, and during the closing days of the month the number was 1,000 daily.

This is very fortunate, both for California and her guests. We have plenty of everything which is really joyful and wholesome, and for those who think they must have something else there is the assurance that Mexico is not far away; also the possibility that there may be foreign light-ships anchored over three miles out and no prohibition against the ancient way of bringing booze in skins—providing they are your own.

EUROPE NOT YET READY.

The summer floating population of the country has but little chance to make a long trip this year, except in the direction of California or Canada, because tropic-crossing is not a popular summer recreation and because Europe is practically closed for the season of 1919. It is true that the Belgians issued a formal invitation to tourists and other western countries of the continent of Europe might like some reparation in the form of an American invasion, but for all that, Americans cannot go in any quantity this year. The State Department at Washington announces that tourist travel to France will not be permitted before next year, in this way:

Business men will be permitted to send agents to any European country following the signing of the peace treaty, but restrictions as to the return trip will continue in force because of the needs of space for soldiers and civilian War Department employees. Measures to prevent undue travel to Great Britain also will be continued as transportation and economic conditions in Great Britain still are far from normal.

These facts are in a way fortunate. Americans would probably rebel against being kept at home arbitrarily, but while purposeful business travel will fill ships returning after bringing westward cargoes of our soldiers, there should be no merely sight-seeing travel allowed. Besides, it seems silly to appeal to American farmers to produce their utmost because Europe is hungry and then send shiploads of American tourists to go abroad to eat

up shiploads of relief-supplies at a fearful profit to European hotel-keepers. Let American tourists swing around the circles in this country, and spare themselves the sensations of seeing Europe in physical desolation and social tumult. Let them rest and grow fat upon the food-supplies which our producers have secured at unusual cost and effort. It will help crop-producers to recover their unusual outlays for labor, implements and supplies because American transportation, purveying and catering will be kept busy. The patriotic American should see very clearly that it is not alone a question of "seeing America first," but of paying Americans first.

MAINTENANCE OF PRICES.

Those who look at American affairs from the financial angle seem to agree that prices of commodities are likely to remain high for several years, if not permanently, and therefore people should not postpone investment in building, in merchandizing, in manufacturing and in general enterprise for fear that "prices will drop on them" before they can get a turn-over. We presume the view is mostly right, because, of course, if every one postpones doing things nothing will be done, and then we should have a slump and no mistake about it. Therefore, it is proper to exhort everyone who is doing useful things to keep busy and get more busy, and the assurance of price-maintenance is the best possible basis for such exhortation. The Oakland Bank of Savings puts the current view of financiers in these words in its June statement:

A new price level has definitely arrived in the United States and it looks as though it had come to stay. While there is a downward tendency, it will probably be years before there is any material change in the present high prices. One by one the wheels of industry are beginning to move in rhythm with the growing belief that the present prices are so substantially supported by sound economic bastions that further waiting is hopeless.

This is probably a reference to the old, fundamental and orthodox argument that the doubled supply of currency and credit dollars will maintain prices until each of them is brought back to the gold dollar basis, its purchasing power doubled and prices halved to match. We are not sure that this has ever happened, and it may not be the fault of the argument, but the working of the argument may have been interfered with by the many new facts and conditions of life which have intruded while it was trying to come true. For this or other reasons it does not appear that prices have ever fully receded to a former level, and the degraded dollar has never been fully to blame for the rise of prices nor the ennobled dollar praised for their partial recession.

The relation of the maintenance of prices, which we presume these learned economists and financiers are largely right about, is that probably most of the things which the farmer has to buy will decline in price slowly and in small degree, while the prices of the things which the farmer has to sell may fall about his ears any minute. And the reason for this is not the fortune or misfortune of the dollar so much as it is organization, which will not let the dollar act as the economists expect it to. "Cost plus profit" is the price of the merchant and manufacturer. Cost of living plus profit is the price of labor. The farmer pays both these costs and profits. Proper organization and insistence would enable the farmer to say: "My price is all costs plus my profit." Lack of organization forces him to say: "What will you give?"

Permanent peace is deeply involved in this proposition—for permanent peace must rest upon good will, and good will is a product of a square deal among men. This is what agriculture has always contended for in a careless, sentimental way. Now that the world is being reconstructed, there should be organization to secure it.

California Weather Record.

The following rainfall and temperature record is furnished the Pacific Rural Press by the United States Department of Agriculture Weather Bureau at San Francisco for the week ending July 1, 1919.

Stations—	Rainfall		Temperature	
	Past Week	Seasonal To Date	Normal To Date	Highest Lowest
Eureka00	.00	.00	62 50
Red Bluff00	.00	.00	100 60
Sacramento00	.00	.00	96 52
San Francisco00	.00	.00	83 48
San Luis Obispo00	.00	.00	80 44
Los Angeles00	.00	.00	82 56
San Diego00	.00	.00	72 62
Reno, Nevada00	.00	.00	90 46
Winnemucca00	.00	.00	94 44
Tonopah00	.00	.00	88 56

QUERIES AND REPLIES

By the Editor.

Inquirer Must Give Full Name and Address.

Navel on Trifoliata.

To the Editor: About 8 years ago I planted 6 acres of navel orange trees and, probably through lack of sufficient water they have not shown sufficient growth, although they have a healthy foliage. They now average about 4½ feet high. I have learned recently that they were budded on trifoliata stock, which was experimented with about that time but has since been found unsatisfactory and its use discontinued. Should the trees be uprooted or will they ever make a decent sized tree with proper care?—Subscriber, Lemon Cove.

The trees must now be about ten years from the seed, and such a tree about 4½ feet high impresses us as very nearly worthless for it will be very difficult to break out any decently free growth from such case-hardened stems and laterals as they must have. It is true that trifoliata roots have been largely discontinued except for dwarf varieties, like tangerines, etc., but they cannot be charged with such radical dwarfing as you describe. On land uniformly moist they do support a good-sized standard-variety tree and for some time the claim against them of dwarfing was strenuously disputed—though now generally conceded. In your case it seems more likely that your dwarfs are not chargeable to the roots so much as to trying to grow oranges by dry-farming, and it is possible that if you had tried it on anything less hardy than trifoliata you would not have any orange trees at all by this time. Unless you have secured adequate irrigation you had better retire from citrus growing and if you now have water our notion is that you would arrive at profitability sooner by replanting with trees on standard roots than is possible by undertaking to force the trees you now have to do anything. And that conclusion is not based so much on the trifoliata as it is upon the general fact that the trees have been so hopelessly dwarfed by hardship. Their root-system is probably as pitiful as their top-growth—so you practically have the whole thing to make over.

Fertilizers for Particular Crops.

To the Editor: What are the best fertilizers for raspberries, blackberries, loganberries, gooseberries, currants, cherries and strawberries? Also for peas, beans, corn, cabbage and potatoes? When should they be applied, and how? I have used land plaster (gypsum) without particular results. What do you know about sulphur as a fertilizer for the crops mentioned above?—G. M., Portland, Oregon.

The whole question of what particular fertilizers particular crops require and what particular service particular fertilizing substances render to plants, is up in the air. The scientific basis of prescription is unsettled and investigators have taken to aeroplanes, which will strike the ocean with Hawker or land in an Irish bog with Alcock, or alight like a bird in Hyde Park, no one can now tell. It seems likely that all the plants you name must be given the same things in ample supply, with soil in proper culture and moisture adequate. It is possible that we shall have to plump down the whole menu, just as they do at a railway eating station, and let each hungry organism grab what it likes. The reason why you do not get results from gypsum (which has only lime and sulphur) perhaps lies in the fact that you are laying out milk-toast for organisms which have an appetite for ham and eggs. We do not know much about sulphur—except that recent experiments have shown that it is a very necessary and sometimes a very profitable thing to the plant grower, while not long ago the scientists held it to be negligible. We are aiming to get our readers abreast of this very intricate and constantly changing science of fertilization by presenting to them the series on "Fertilizers and Fertilization," by Dr. C. B. Lipman, in our current issues. These articles may not appear in every issue, but they will be consecutively numbered so readers may know the sequence and not miss any. The result will not be the use of less fertilization but perhaps more and with better results and less disappointment than hitherto.

Treatment of a Garden Cherry Tree.

To the Editor: I have a cherry tree in my yard, about 8 or 9 years old, which is discharging a substance which forms a gum, mostly on the trunk of the tree and branches that are right off the trunk.

I have been informed that if the tree does not receive some kind of a treatment that it will die, and wish you would inform me what is to be done. Do they prune cherry trees? I have talked with several people who say no.—Amateur, San Francisco.

Gumming of cherry trees on the trunk's main branches and in the crotches of the two, is generally due to natural bark defects and does not necessarily indicate disease nor lack of thrift in the tree. Such gum is softened and can be easily removed during winter rains, or may be wet with your garden hose until it can be removed easily. It is not good for the tree to have the bark covered by extensions of the gum-flow, but the tree is not likely to be killed by it.

Cherry trees should be pruned when young so as to prevent close forking, for such sharp-angled crotches are apt to gum, while branches which start out at a wide angle, or more horizontally, join the barks of trunk and branch better and do not gum. Pruning of cherry trees after attaining bearing age consists chiefly in removing weak or interfering branches and not in cutting back. As a garden tree the cherry takes a natural and satisfactory form with very little pruning after it has been induced to head low by cutting back at planting.

Non-Opening Rosebuds.

To the Editor: I send a twig, with leaves and a bud, from a rose bush which was brought from Auburn, California, a few years ago. It buds profusely every year, but not one bud has opened out well, nor even half-opened, any year since we have had it. I do not find any insects in the bush. Do you think the bush needs fertilizing or re-planting?—L. C., Nevada.

The growth is slim and the leaves thin, but free from pest and disease. The bud tissue is normal but rather scant and weak. It is possible that there is lack of sap-pressure and if so, it may be due to soil unsuited to the rose. The non-opening of buds is, however, characteristic of some varieties, even under the most favorable growing conditions, and seems to be due to aerial conditions of temperature and humidity which do not favor full development of the flower even though the bush be vigorous. If you wish to try an experiment, knock both heads out of a barrel (or both ends out of a large box) and enclose the bush, covering the top closely with white cloth. Water inside frequently and create a moist atmosphere and see if you can force the opening of the buds. If you do not care to experiment, replace the bush with a cutting or a rooted bush of some kind which does bloom well under your conditions. Some rose bushes are like some men—they never seem to be worth the trouble of raising them.

Anthracoze of Currant.

To the Editor: The leaves of my cherry currants look rusty and drop off. They look as if suffering for want of water, but the soil, a sandy loam, is in good moist shape. The fruit buds to a great extent fall off and what fruit there is left is imperfect. What is the matter and what remedy could I apply?—J. T., Santa Rosa.

It is an anthracnose—apparently caused by the fungus *Pseudopeziza ribis*. If this is the proper identification of the organism it is an old causative of disease with currants at the East and in Europe. It is not the same fungus affecting berries in your region which was discussed and prescribed for in our issue of April 5th by H. J. Schnabel of Sebastopol, but similar treatment will prevail against it. Falling leaves should be raked up and burned. Dormant spraying with Bordeaux or lime-sulphur just before the buds start ought to largely reduce the trouble, but it may be that a summer spraying may be required. This must be determined by experience.

Abnormal Potatoes.

To the Editor: What is the cause of potato vines growing very tall with dark green leaves and blossoming almost all summer and very heavy vines. They had lots of large potatoes but they were all joined together and my vines look as though they are going to be the same this year.—Reader, Coulterville.

There is probably some lack of adaptation of the variety you are trying to grow to your growing conditions, or you may be using too much manure. See if your neighbors have varieties which behave better or get enough of several varieties from the seed-potato dealers for next year's planting, and try them out. Do not use seed-spuds from plants which behave as you describe.

WHAT ARE YOU DOING?

We have a number of men who are doing excellent work in our circulation department, looking after our renewals and securing new subscribers. They enjoy the work and are making good money.

We can use a few more men, and if you are not satisfied with your present work and feel that you can earn more money, perhaps we have just what you are looking for. Anyway, it won't do any harm to investigate.

So if you have an automobile and are free to travel; if you are not afraid of hard work, and believe that you can successfully present our paper to the people, write us about yourself and we will give you full particulars.

Cut Their Heads Off!

To the Editor: I have apple, plum and cherry trees. Most of the apple and cherry trees bear well, but a few apple trees do not bear at all, or even have blossoms, although fifteen years old. The growth of new wood is thrifty each year, and the trees have a healthy appearance. Other trees within sixty feet have a large set of apples this year, so I will have to prop up the limbs. The soil appears the same throughout the orchard. These trees have had the same cultivation and were planted at the same time as the other apple trees. What is the matter? Why don't they blossom and bear fruit? They look too good to root out. What shall I do with them?—G. M., Portland, Oregon.

You may have secured a few trees of a variety which is sterile under your conditions, but it is more likely that they slipped the bud or the root-graft in the nursery, and you have therefore a bunch of seedlings which may never bear or be worth anything if they did. Have them top-grafted next winter with scions from your own trees which are most productive and profitable.

Strawberry Expectations.

To the Editor: What returns could one reasonably expect from an acre of strawberries? I know that it will vary a great deal with the care, climate, season, variety, etc. But what I want to know is, what would be a fair average? Would \$300 an acre be too much to expect? I have an acre of soil, fine brown loam, about 18 inches deep; below that a pretty hard clay subsoil with a little sand through it. There is plenty of water from an artesian well for irrigation. It looks to me like a pretty good place for strawberries if they would pay enough.—H. K., Ventura county.

The figure you name is certainly a reasonable expectation and you might do much better. Your soil and water conditions are excellent. Other matters to figure on are the availability and cost of picking-labor, the markets you will supply, and what it will cost to deliver to them.

Red-Humps Have Aeroplanes.

To the Editor: The red-humped caterpillars are bothering my plum trees. Can I keep the adults from getting up into the trees to lay eggs if I put a band around the trunks of the trees? The early caterpillars have gone into the pupal stage now and are down in the ground. Can I keep the adults down so there will be no more eggs to hatch out?—E. M. A., Exeter.

You cannot interfere with this pest by bands on the trees. The full-grown caterpillars drop to the ground as you state. They will stick around the ground surface until next May or June, when they will transform into moths, which have good wings and have no trouble rising to the leaves for egg laying. Banding to keep down moths which transform in the ground is only useful with species of which the perfect female moth is wingless—as in the case of the canker-worm moth.

Interior Valley Walnuts.

To the Editor: Are the climatic conditions of the Tulare foothills suitable for walnuts? Our temperatures reach to 105 and 108 degrees.—Subscriber, Lemon Cove.

The French varieties on the California black walnut root are doing well under such temperatures as you indicate, but there is little hope of satisfactory results unless you have good depth of soil and a sufficient moisture supply. The trees may stand hard conditions in many places where they would yield no profit.

Red-Headed Linnets and Berries.

To the Editor: Can you tell me of an easy way to destroy the red-headed linnet? It is very expensive to shoot them at the present prices of ammunition. These birds are of no use, and we just cannot grow a berry crop, as they do away with all the fruit.—W. H. G., Loyalton.

We know of no satisfactory protection except covering with mosquito netting, and that is impracticable with a commercial crop. This has been an unsolved problem for decades. If some one is going to get the answer, will he kindly hurry up!

Plan for Farms Without Prepayments.

(Written for Pacific Rural Press by Hon. Harry Polsley, Assemblyman Fifth District.)

The object of all the land settlement laws is to provide homes for returning soldiers, and to help needy persons to get homes for themselves. It will be evident that the acts, as interpreted by those who have the execution of them in charge, will not help one per cent of the returning soldiers. The requirement that any one, to take advantage of the provisions of the act, must have something like fifteen hundred dollars will shut out all of those who are supposed to be benefited. The one who can become a settler must be one who is doing well, is out of debt, and has more than one thousand dollars in the bank. Dr. Mead tries to explain, in your issue of May 31, that there is not that requirement. But from his own statement in the example he gives, he requires a payment of 15 per cent of the purchase price. It does not change this fact for him to itemize the account, as so much on the land, something else for improvements, etc. The improvements can not be separated from the land.

The person who can meet the requirements of the Durham plan can buy anywhere. Dr. Mead mentions that the State will plow and cultivate the land with tractors, and in other ways save the settler some expense. But different subdivisions in this State have been for years doing this for their settlers. They have also provided expert advice and, further, and better than the State is doing, have provided grade cows, to be paid for from part of the cream checks as they come in. The only advantage to the settler, as I have stated before, is that there may be something gained in the price, and that, by taxing the rest of the people, longer time and lower rates of interest may be given to the one fortunate enough to be accepted as a purchaser.

Those who have been writing and advocating the land settlement laws seem to me to show a lamentable ignorance of modern American methods of handling land. They have traveled the continent, Australia, England and America, but like most travelers have only seen the surface. They have not gone into the fundamental principles of the land business. English ways have appealed to them, as, for instance, in the Durham plan there is the provision for the Farm Laborers' Allotments. This is a little thing, but we have no class distinction like this in America, and I am not anxious to see it come. Sell a man an acre if he wants to buy, but do not class him as a farm laborer.

Are Advanced Payments Necessary?

But is it necessary, or is it customary, to require the settler to make a large per cent payment in advance? The United States Government, in its Pre-emption and Homestead laws, did not require an advance payment. Yet this was the largest land settlement plan ever undertaken. It is said that the land was unimproved, but for improved land the difference should be that there would be larger payments required. Under that plan, however, millions were able to obtain homes. But it is not the payment of a large deposit that makes for the settler's success, as is intimated in thousands of cases where large advance payment have not prevented the settler from making a failure.

In the private schemes the 10 per cent advance payment, and often much more than that, goes to the selling agent, so that as between the owner of the land and the buyer there is practically no payment received. And this takes no account of the advertising charges. The fact of the case is a great per cent of all land sales are on option, usually with no payment down, or only a nominal amount. Possession is given or not according to the contract. For instance, a promoter will contract with the owner of a suitable tract for subdivision; he will plot and improve the tract, and advertise and put it on the market. He will charge the settler a certain per cent cash which he will retain to cover his expenses. The next pay-

ment, which may not come for a year, will go to the owner of the land. The owner on his part agrees to accept the buyers' contract as collateral, and when the payments are completed gives the buyer a deed.

It will be seen that as between the owner of the land and the settler, the owner does not receive payment for some time after the settler is on the land, and usually after he has an opportunity to make at least a part of it from the produce of the land. It will be seen from this that the State, as owner of a tract of land, will not have advertising bills to pay, and will not have to pay the promoter's commission; and can afford like the private owner, to sell without the advance payment, and wait for some months to give the settler time to work some of his payment from the soil.

It will be understood that any land that it is proposed to place a settler upon, will, if the proper-sized tract and the right kind of soil and climate, to the industrious farmer, produce not only enough to keep his family, but also enough more to pay for the land, if given a reasonable time. And no land should be permitted to be sold to a settler unless it has been determined beforehand that it will do so.

Why a New Scheme Was Proposed.

Realizing that the State Land Settlement Bill would not be of any benefit to the returning soldiers, the writer, who has had some experience in handling real estate, after consulting with some of the most successful dealers in the State, men who have been placing people on land for years, outlined a bill amending the Land Settlement Law. We had the advice of a number of prominent attorneys as to the legal questions involved, some even giving weeks of valuable time; but their motives were patriotic. Assembly Bill 596 was the result, but it failed in the closing hours of the Senate. It amended the law so that the State could buy an option, the same as the realty dealer, and sell on contract. This made it applicable to any part of the State and would have permitted the owner of the land to carry the burden of the debt instead of the State.

But it is said that unless the settler has a money interest in the land he may not stick. And around this statement range all the arguments against giving the returning soldier, or the poor man, a chance. I have shown that in practice the owner of the land is willing to wait, and usually does wait, some time. It is also known that a large advance payment does not always hold the settler. So we finally get down to the selection of the person, his character, ability, experience, family, health, etc. All this can be easily gone into, and should be done even if he had enough money to buy outright.

It is not proposed to give a man a deed outright, but to give him a show and a chance to put his labor and that of his family against the investment of the State or the landowner. Owners will rent land for a share of the crop and wait until after harvest before they get their money. Now if this was a sale of the land, the part called rent would go to the owner, as a payment on the purchase. Under this plan the first payment is only deferred for a part of the season.

There are many deserving men of good character, men of their word, who, for some reason or other, often not their fault, have been unable to get a start, who if given a chance will make good. The chance of getting a home of their own is for many people the greatest ambition that they have, and it would be the greatest incentive that could be provided to get them to stick. The man with money, who can buy elsewhere, may give up easily. It will be said that irresponsible people will be taking advantage of a proposal of this kind. Yet, under this contract plan, there is a way to give them a tryout, and if they do not

make good, there is not much loss, the land is still there plus any work that may have been done by the settler. But should we fail to provide for our soldier boys because there may be some among them who may not come up to our expectations, especially when there is no chance for loss in giving them a trial; and should many willing, competent men, often with families able to help, be turned down because there are some who sometimes may fail? Many writers and professional men appear to be out of sympathy with the heart of the common people. The difference between us may be stated in this way: the Land Settlement Board must have money. While I would capitalize the settler's character, experience and ability to work, in my plan the first payment would be deferred for a few months and probably would not be so large. But in one way the settler on the Durham plan, and in the one proposed, would be on the same footing. They would both be without money, since under the Land Settlement plan the State would probably have taken all the settler's money in the first payment.

The Fourteen Counties Plan.

The outline of the Fourteen Counties Plan is this: Suppose that a man, for instance, with a family of boys, who is a farmer by experience, comes and states that he wants a home, can show good references, is willing to work, will even live in a tent until he can make enough to build a cabin. Why not put him to work; if necessary, sell or rent him some stock, let him work the tract that will eventually become his own. Take a share of the proceeds of his labor and ap-

ply it on his purchase price; give him time; if his disposition is to make good, and every year his interest in the home will become greater until finally it is paid for. Usually one member of the family will get work outside while the remainder of the family stay on the land. We have a contented settler who otherwise would never have been able to get a home of his own. There may be something altruistic about this, but it is plain, practical business just the same.

Red Bluff, June 18.

SUMMER PRUNING YOUNG PRUNES.

To the Editor: I wish your advice on prune trees that are now in their fifth year's growth. They have their scaffolding of six limbs, but this year we pruned lightly. They are strong, vigorous trees on deep soil, and if it is desirable, I wish them summer-pruned, but I want the fruit if it is possible to get it during these unheard-of prices—Mrs. D. F., Santa Rosa.

Assuming that they are French prunes and not Sugars, they should not be topped any more and need no summer-pruning except to remove undesirable suckers. If you have some low-growing suckers that you wish to convert into fruiting wood, they should be nipped back now. Otherwise only crossing or other undesirable growth need be removed. Let them come into bearing.

Arsenate of lime may be used in place of the more expensive arsenate of lead, but should not be used on plants with delicate foliage, such as the stone fruits.

All wood vertical grain, plenty of spread.

Are you a Cave Man?

—of course not—then why use the Cave Man's tools? Do you know that until the

SECURITY KANT-WOBBLE LADDER

was patented there had been practically no real improvements over the ladder the cave-man used in the stone age.

Security Ladders are built with a patented steel cuff-bracket machine-wrapped around stile at each step-end, making possible the slim, lithe construction that combines strength with lightness, and forever does away with the wobble.

Will ship on approval, freight prepaid, if your dealer is not among the 65 listed in Pacific Rural Press of May 24th, page 798.

Community Irrigation Pumping Succeeds.

(Written for Pacific Rural Press by E. E. Hodges.)

Booster Station No. 3 pumps from three wells and from the sump which drains a unique infiltration gallery located where Deer Creek leaves the Sierra foothills.

If you could have raised eight sacks of wheat this year on well summer-fallowed land under the Terra Bella Irrigation District, how much more would you have to raise to make a profit by use of the irrigation which has recently been proved a success there? A lot of folks didn't figure it out as we do, or else they couldn't get the capital or help; for too small a percentage took advantage of the opportunity.

A unique irrigation system it is, having been designed to irrigate 12,000 acres around Terra Bella by means of community pumps, reservoirs, protected steel pipes, and meters. Most of the figures used in this article are taken from various articles published by the Terra Bella News, whose editor, Earle R. Clemens, was one of the chief boosters for the district, and who has been its secretary from the beginning. Estimates were made and the work done under direction of Chief Engineer Stephen E. Kieffer, who has done work of a similar nature at various places in the West.

The district was organized under the Wright Irrigation Act by an election August 7, 1915, in which there was not an opposing vote. The first water was delivered late in 1917, but owing chiefly to war conditions and the rolling character of the land, only 2,211½ acres were served last season besides the municipal and domestic water supplies. People seemed to think that it would not pay to irrigate anything except fruit trees and gardens. Those grain growers who put in their year's labor and use of the land for half a crop or less, may well do some figuring and call for water next season.

Cost of Water Reasonable.

Plenty of water is available, and the more acreage benefited by it, the less will be the cost per acre. Viewed with respect to the cost of water in districts with gravity flow, it was more expensive at Terra Bella, thought it was less expensive than individual pumps. The operating cost, paid by users only, was \$7.30½ per acre foot of water in the 1918 season, but there were several reasons for this which will not operate next season, and certain other economies may be put into effect. The whole district was assessed about \$4.00 an acre to meet interest on \$760,000 outstanding bonds. The four dollars per acre had to be paid anyway, and if the use of an acre foot of water per acre would increase the wheat crop two sacks per acre, the extra expenditure would show a handsome profit the first year. This, of course, does not consider the cost of leveling or contouring for irrigation, which would add its cost to the value of the land, increasing the charge against the crop only by the amount of the annual interest on the cost of leveling.

For fruit, there is no question as to profitability of irrigation at the costs figured; and increased planting is expected to increase use of water so

Boost Water to Higher Levels.

Five pumping stations deliver water to as many zones at elevations varying from 462 to 811 feet above sea level. The main pumping station takes water from the valley wells via 26,720 feet of collecting pipe, varying from ten to thirty inches in diameter. It delivers water to about 1,700 acres and also pumps up to Booster No. 1 from which about 9,000 acres may be irrigated. Booster No. 1 also pumps up to stations four and five. Station four delivers to two different zones including 800 acres of the highest land in the district. Station five has two pumps operated by motors of 80 h.p. and delivering at full capacity 1450 gallons per minute, or 161 miner's inches. Station three is located at the infiltration gallery. It delivers 250 miner's inches when operating full capacity and is the only one operated

during winter time. It is at the 541 foot level, while the town of Terra Bella is about 462 feet, so there is plenty of pressure for domestic use in winter.

Water All Piped and Metered.

The water used last season was distributed through over 300,000 feet or about 58 miles of protected steel pipe, being delivered to the property lines of each of 149 water users and measured there by recording meters. Only once were the leaks in all of this pipe more than one man could take care of. Most of the pipe and well casing were furnished by the Western Pipe & Steel Company, and the Lacy Mfg. Co.

Wells, Pumps and Motors.

The dozen valley wells are 521 to 1090 feet deep, and the smallest casing used in any of them is eight inches in diameter. All of the sixteen pumps used on the wells and at the boosting stations are of the Byron Jackson make, and have given entirely satisfactory service. They are of the deep well turbine type in the valley and of the centrifugal type in the booster stations. Each of them is run by a Fairbanks-Morse electric motor. Electricity cost over \$20,000 in 1918. Additional wells and pipe lines are now being put in to care for the increased demand already materialized and expected.

Fifteen thousand feet of new steel pipe six to nine inches in diameter have already been laid this season, and two more wells were put down last winter. These and the other wells would furnish more water than their pump equipment is designed to throw. The new ones will give 150 miner's inches. Contracts have been let for two more wells; and the capacity of the infiltration gallery will be doubled this season according to Mr. Kieffer.

Digging ditches for the 58 miles of pipe through which water was delivered to property lines of all users.

as to reduce the overhead expense per acre foot. Here also there is no question as to the advisability of leveling or contouring for irrigation.

Water Already Developed.

The district started the spring irrigation in 1918 with ten wells in the valley, each testing 100 to 177 miner's inches, and three wells and an infiltration gallery higher up on Deer Creek. This gallery is interesting. Where Deer Creek opens out into the valley 3630 feet of coarse open-jointed cement pipes have been laid in the sands six to twelve feet below the creek bottom, and all leading to a sump whence the water is pumped. These are calculated to have a capacity of 250 miner's inches when the water level is about them. The three wells nearby are calculated to yield an additional 100 inches.

Testing one of the ten valley wells which average 115 miner's inches, or 1035 gallons per minute. (Courtesy Terra Bella News.)

PELTON

PELTON BELTED PUMPS

Ready for immediate shipment, right now when you need water. Drive them with a gasoline engine, tractor or electric motor. Later, when the pumping season is over, you can connect the same pump direct to an electric motor and have the most efficient and economical pumping unit possible.

Natural Control of Mealy-Bugs

(Written for Pacific Rural Press by John J. Fox.)

"The little fleas which do so tease
Have smaller fleas to bite 'em;
The smaller fleas have lesser fleas
And so—ad infinitum!"

This school-boy jingle, which is evidently so old, nevertheless contains an element of truth. For the tiny insects that do such incalculable harm to our fruit trees, vines and plants, have troubles of their own that we wot little of. It is the entomologist's duty to find out those troubles and breed them. How far this is being done and what it means to the horticultural and agricultural industries is not yet sufficiently known and appreciated, even so far as it has already gone.

The State Insectary at Sacramento, extensive as it is, was not large enough to deal with the demands made upon it by the citrus men of the South.

In response to their appeals for assistance in control of the mealy-bug a branch of the State Insectary was established at Alhambra in Los Angeles county, in the fall of 1916, in charge of H. M. Armitage, and another at Santa Paula in Ventura county, under County Horticultural Commissioner A. A. Brock. In the latter place the Limoneira Company also have their own private insectary for rearing predatory insects in defense of their own orchards. This insectary is in charge of a trained entomologist, whose duty it is to watch for insect pests and control them in these orchards. All three of these insectaries were established by H. S. Smith, Secretary of the State Insectary. When a private enterprise goes to this expense it is pretty positive proof that the business grower is very much alive to the value of the thing and this we propose to illustrate.

The Citrus Mealy-bug.

Every citrus man knows what this pest does to his trees and fruit; how all parts of the tree suffer; how the insects cluster on the fruit and destroy its value, even when they do not cause it to drop prematurely; how the honey-dew secreted by them covers the leaves, which later become black with sooty fungus as do sound lemons. Now, of all the various natural enemies it has among the ladybird beetles, the *Cryptolæmus montrouzieri* has been chosen as the best to date, and this is being bred in the insectaries for distribution among the growers. Ninety-five infected orchards were supplied last year.

A Notable Example.

We went into the A. Culp orchard at Santa Paula of ten acres, which had been badly infested with mealy bug. This was the first orchard worked on and cleaned up by H. S. Smith. The trees had been black with sooty fungus on the exudations of the insect, and a good spraying had been given of kerosene emulsion at a cost of 25 cents a tree. Fumigation was resorted to but the trees became again badly infested, and gas does not seem to be effective with this insect. Then in October 1, 1917, 5 larvae of the *Cryptolæmus* were liberated in the orchard as a starter. In the following year in February, April, May and June, a number of them were liberated in this orchard twice a week. In all 6,900 beetles were liberated at an estimated cost of 1 cent a beetle. By July the beetles were in the ascendancy and the orchard was declared cleared of mealy-bug by September 1 at a cost of \$69. A double fumigation, the only other suggested method of destruction would have cost \$500 or more. Spraying would have cost about \$200; would be necessary every year, and would be incomplete.

Fecundity of the *Cryptolæmus*.

Beetles were taken from this orchard to furnish to other men. For instance, 50,000 of the *Cryptolæmus* were taken from this one orchard in August without an appreciable diminution of their numbers, as they multiply so rapidly. Growers are often afraid to have them collected and taken out of their orchards, but Mr. Brock says there is no fear, as the collector's efforts are as nothing in reducing their numbers. A small fan-shaped sheet framed on a stout wire

was invented by Mr. Armitage to collect the insects. Its smaller end is attached to the screw top of a mason jar. The sheet is held under a branch, which is smartly tapped when the insects which fall on the sheet are shaken down into the mason jar. The top is so arranged that they cannot crawl out again—the fly-trap principle. Sixty-five thousand were taken in three hours with these sheets where it took two days to gather 25,000 by former methods.

The Intelligence of Ants.

We noticed a little bag of some sticky looking substance tacked on the bottom of each lemon tree, which Mr. Brock explained was ant-poison. If the poison were strong enough to poison the ants then and there, they would soon "catch on" and leave it alone. But it is sufficiently slow acting so that they can carry it to the queen and the nurseries.

It seems that the ants quickly discovered that the *cryptolæmus* is destroying the mealy-bug, which the ant likes to preserve on account of its secretions of honey-dew. Therefore they try to drive the *Cryptolæmus* away and have to be poisoned so as not to interfere with his work.

A Quick Job.

We were taken by Mr. Brock to the L. E. Mills lemon orchard near Santa Paula, some of whose trees were badly infested with mealy-bug. A double-shot fumigation was first tried on 13 trees, but Mr. Mills found that the fruit was damaged to some extent by this double shot, so he turned the orchard over to Mr. Brock to clean up. The first *Cryptolæmus* were liberated in the orchard September 18—5,000 of them which had been collected in Santa Barbara. On October 26 he was collecting bugs out again from this orchard for liberation elsewhere, and the orchard was declared cleared of mealy-bug at the end of 60 days after the first liberation. The cost to owner was \$68. Fumigation would have cost about \$500. The trees here were large, well kept and of good color. A heavy dressing of manure was put out as a top dressing. The E. W. Williams grove is now being cleaned up near by.

Artificial Aid to Rapid Increase.

In the Culp and Mills orchards, where such good results have been obtained artificial pupating places were provided for the *Cryptolæmus*—burlap bands, etc. This is to prevent their going to the ground or under dead rubbish where a greater loss would take place. This is one important factor and another is the control of ants as described. The chief thing is to have enough of the *Cryptolæmus* bred so that it can have an equal start with the mealy-bug in any plantation, or much injury to fruit, defoliation and damage to tree vitality may result before the pest is finally overcome by this beneficial parasite.

The distribution has to take place through collectors as the *Cryptolæmus* is not a good prospector for new pastures or new fields to conquer. The future work of officers, therefore, will be probably to make collections from infested orchards, of *Cryptolæmus*, and distribute them where wanted. For the work here can be carried out on a wholesale scale, impossible to obtain in any insectary where mealy-bugs are bred on sprouted potato tops to feed their parasites—an endless

job, but it has to be done. The breeding of mealy-bugs on potato sprouts was the outcome of research by H. S. Smith at the State Insectary.

The Table Grape Men.

As table grape men can no longer ship any grape where mealy-bug is present, they are now making demands for *Cryptolæmus* to supplement their spraying and it has been suggested that still another branch of the Insectary be established in the South San Joaquin.

In the two or three orchards we visited, this useful little insect, by

careful manipulation, seems to have made as clean a job of the mealy-bug as the *Vedalia* (or *novius*) *cardinalis* does of the cottony cushion scale. They were said to have been introduced and naturalized in California at about the same period. The *vedalia* was exploited at once. It is now time for the *Cryptolæmus* to hold office, for he comes well recommended.

The Patterson Land Company lost \$100,000 from grasshopper damage last year and was willing to spend \$20,000 this year for control.

Anderson Combination Dipper Perforator, Grader And Spreader

Send for Catalog of Packers' and Dryers' Machinery.

A practical machine that the prune growers of Santa Clara Valley (where it is made) and other prune-growing sections have learned to recognize as the standard machine of its kind. It embodies every possible advantage—and does the work perfectly in every way. Durable and substantial in construction.

MADE IN VARIOUS SIZES

We can furnish this Combination Dipper, Perforator, and Spreader in any size desired—for either hand or power use. Write—and tell us your requirements.

SURFACE IRRIGATION PIPE

Here and There in the Fruit Business

[Written for Pacific Rural Press.]

Prunes Slow in Development.

Prunes seem to be sizing up, making size more slowly than last year and some men think they are not going to make the grades expected earlier. The temperate temperatures of this season may have something to do with retarding the development of this fruit, for the trees themselves are in fine condition and have made a good spring growth of wood. The Oregon and Washington crop is estimated at about 30,000,000 pounds. The frost they had last month dumped off more fruit than they expected and the cold rains have not helped development.

The California Co-operative Canneries Have leased the California Italian Products Cannery at Tulare and will use the plant up to the time of the tomato season for the manufacture of apricot butter and canning peaches. They have purchased the pool of the Tulare County Peach Growers' Association—a total of 80,000 tons at \$92.50 per ton. Three thousand tons will be canned at Tulare, the balance going to the San Jose cannery. The Co-operative Canneries Company is contemplating the erection of its own cannery at Tulare to be ready for next year's crop. The plans call for a \$250,000 plant.

Efficiency at Receiving Station.

The new packing house at New-castle center of the California Fruit Exchange is so arranged that seven trucks can unload fruit at a time. They then drive right around the building (to allow those behind to follow), and load up with shook and supplies from that department. All State and Federal regulations on standardization inspection and transportation are posted in a conspicuous place, together, with samples of all packages required. Every district member has his own pigeon-hole in the office where he can keep in daily touch with his affairs and get his daily bulletin without having to ask or wait for them.

Large Purchasers of Property.

The Virginia Food Products Company of Oakland has added to its large purchases of winery and vineyard properties by the recent acquisition of 640 acres comprising the old F. T. Eisen vineyard, six miles east of Fresno. The price paid is said to be \$375,000. This company recently bought the La Paloma winery for the purpose of converting it into a plant for the manufacture of grape beverages and other products. It is said that they hold options from the California Wine Association on many of the largest wineries. Their purchase of the Mission vineyard of 1,000 acres near Cucamonga in San Bernardino county, and securing an option on a large winery near Lodi are other instances of the activity of this firm, which is said to be backed by a group of big Eastern business men.

Labor for Grape Harvest.

In common with other sections, Fresno, center of the great raisin industry, is busy providing for the importation of labor for the raisin harvest next September and October. "The labor problem this year will be the most serious in our history," according to W. F. Setchel, President of the Valley Fruit Growers' Association who is investigating possibilities of providing for the needed help. Between 7000 and 8000 outside hands will be needed for the raisin grapes alone in addition to 10,000 to 11,000 local pickers and they will have to be brought in on the understanding that they will be needed for only about two months. In addition to the harvesting hands, the wine grape, peach men and cannery men will need quite a few hands, and employers are getting busy none too soon. The prune men are also on the lookout for pickers and engaging families in advance, and are preparing tents and other accommodations as inducements.

A Mechanical Cracker.

G. W. Pierce, President of the Almond Growers' Association said at

the Deciduous Fruit Men's Meeting recently: "One serious problem that affects almond growers is the inadequate protection afforded our industry—3 cents tariff on unshelled and 4 cents on shelled almonds. There is not enough difference here. We have no mechanical cracker that can shell the Jordan without injuring the meat, while this shelling is done by hand in the cheap European labor market. The hard-shelled Jordan is the meat used by confectioners and imported shelled. We are working ceaselessly to develop new markets to take care of our new large acreage of almonds, yet we have an enormous importation to compete with. We cannot hold our nuts—they must be sold in time for the holiday trade. Later a lower price has to

be accepted. The difference in cost of shelling abroad and in California should be considered in the tariff."

HORTICULTURAL LESSONS IN THE FIELD.

(Written for Pacific Rural Press.)

James Mills, the well-known orchardist of Colusa and Glenn counties, attended a demonstration of pruning at the Davis Experimental Farm. He was accompanied by D. B. Macoun of Maxwell, and brought two of his head tree-pruners with him to gather some pointers from Prof. Tufts. Mr. Mills in commenting what could be learned from these field demonstrations, said, in effect: "I consider that our fruit growers' conventions should be held largely in the field. It is in the field and with some informal discussion of what is before our eyes that we learn things. Soil conditions by management, tree conditions, and the results of spraying and pruning. How much

better all these things can be demonstrated than described. I would hold a prune growers' convention for the prune men, a grape growers' convention for the grape men, an orange growers' convention for the orange men, and so on. It is in the field that the scientist and the producer should meet." This is right in line with the useful program carried out in the Santa Clara Valley for last week in January, between the University of California and the Horticultural Commissioner C. R. Cody—as "meaty" a program as could be desired. Also similar field conventions are taking place among the citrus growers in the South and fig and grapemen in the central and northern sections. One always finds successful growers present where there is a possibility of learning anything about their business.

Cherries have been marketed in quantity by parcels post at Weaver-ville (Trinity county), most of them going to the Redding market.

Test Special THE BEST Rubber Belt MADE

A Belt for Every Purpose

Belts are made in various weights and sizes. They differ as to number of plies, thickness, manner in which woven, etc. In order to perform its duty a Belt must be chosen according to the work it is to do. If selected with this object in view it will render the maximum service and power. You cannot expect one horse to pull a two-horse load. Neither can you justly expect a 6-inch 4-ply Belt to do the work of an 8-inch 4-ply Belt.

Use the Right Belt

TEST SPECIAL Belts are made in all sizes and grades. We have a Belt for every purpose. No matter how large or small, or how great the strain we can supply you with a guaranteed **TEST SPECIAL** that will meet your requirements.

TEST SPECIAL BELTING is made from pure cotton fibre, specially woven; and securely vulcanized with high grade elastic Rubber Friction. Will not separate between plies or stretch. **TEST SPECIAL** assures you of maximum power and maximum service at a minimum cost. It's an economical Belt of superior qualities.

NEW YORK BELTING AND PACKING COMPANY

519 MISSION STREET : SAN FRANCISCO

HOME OFFICE: NEW YORK CITY.
Branches in all principal cities.

Our Guarantee

We guarantee **TEST SPECIAL** Belts never to separate between plies, and to give continual and satisfactory service longer than any other Rubber Belt made. We make prompt refund of money if Belt doesn't come up to our guarantee.

We Are Belt Experts

Often a Belt proves unserviceable because it is used under unfavorable conditions. Nine times out of ten this can be remedied. If you are having trouble, write us. Send us a rough drawing showing how belt is being used and specify your trouble. We will tell you how to adjust it, etc. It's all free. Write today.

ARCADIAN

Sulphate of Ammonia

Men who applied ARCADIAN Sulphate of Ammonia to their grain are beginning to reap the profits.

ARCADIAN Sulphate of Ammonia is the well-known standard article that has done you good service in your mixed fertilizers for years past. Especially kiln-dried and ground to make it fine and dry. Ammonia 25 1/4%. Made in U. S. A. Arcadian is the great American Ammoniate.

For sale by all the principle dealers.

Deciduous Fruit Experiment Stations

(Written for Pacific Rural Press.)

The initial meeting of the Deciduous Fruit Growers with the university men, called at the instance of W. L. Woodard of Campbell, to discuss the establishment of deciduous fruit experimental stations and methods of procedure, took place at San Jose on Thursday, June 26.

Important Meeting.

After a dinner at the Montgomery Hotel, the meeting was called to order. The opening address by H. C. Dunlap, of the Prune and Apricot Growers' Association, outlined the work that had preceded the \$100,000 appropriation made by the legislature and signed by the Governor. He said this was to be the first real experiment work along commercial lines to be established. Those primarily working for the station were the Farmers' Union, the San Jose Chamber of Commerce, the Prune and Apricot Growers' Association, members of the Grange, growers, legislators and the University of California. W. L. Woodard, chairman of the committee was looked upon as the father of the movement and he had worked steadily and faithfully throughout.

"These experiments," said Mr. Dunlap, "depend for their success on the co-operation of orchardists and the scientists who will take charge of the work." To this end he suggested that a committee of orchardists be formed for each substation to co-operate with the university men in the problems their districts present. He suggested that the small sum at their disposal to begin with would not go far to deal with all the work in sight. Therefore the most practical step would be for the professors to make a survey of the state to begin with, see what has already been accomplished by individual effort and what are the most pressing problems in each district. Then make use of what material growers already have gathered and arrange for their aid in continuing to observe and record, whereby the scientists' work might be enriched by constant field vigilance on the part of owners. More people will be benefited and the value of the appropriation be increased by close co-operation.

Other Growers' Suggestions.

G. W. Pearce, President of the Almond Growers' Association, said that the general interest in horticulture had set the wheels going and would keep them moving in this new work. Much in the way of cultural work in all its branches is expected. He said also, "We want new varieties of almonds suitable for shelling. We want a larger percentage of meat and better shapes—a good shelling almond. There is a California soft-shelled Jordan they are now trying out. The development of this will be the first thing asked by the almond men. Almond pruning will also be another of their problems. Mr. Pearce mentioned several instances of almond growers of high standing who have gone on the rocks because of deficient orchard methods.

H. E. Clark of Saratoga—a member of the original committee—said that the chief problem in his district had to do with soils—their improvement by cover crops, drainage, cultivation and other contributing methods of conservation and betterment. Pruning came next—the building up of new orchards and the keeping of old ones in good shape.

Other growers made suggestions along the same lines, and then the chairman called upon Dr. J. C. Whitten of the University of California for a suggested outline of policy.

The Work to Be Done.

Dr. Whitten, Professor of Pomology, who will be in actual charge of the work, said that he came there to get suggestions from the growers and had not been disappointed. A general state survey was most practical. For the problems begin with the growers. In discussing the same problem with different growers one may obtain half a dozen different viewpoints from as many growers on the same subject. Their sum total is sure to present a

pretty good line and gives something definite to work on and furnishes a base of operations. Naturally only the most pressing problems can be dealt with at the start with the means provided. The university experiments have given them a sure basis to start from. General principles in pruning, cross-fertilization and other orchard work is definitely known.

These principles must be adjusted and adapted to suit the idiosyncracies of different localities, including when and how to spray for plant diseases and insect pests. In field demonstrations, unsolved problems will be picked up and recorded in the field. Fruit packing demonstrations are important.

Root Stocks and Bud Selection.

Experiments in the selection of root stocks on which to bud must be developed—stocks that will prove resistant to underground troubles, such as oak root fungus, etc. Pear blight was instanced as having been fairly successfully overcome so far as the root is concerned. And bud selection for best types and varieties will be a very important part of the field work. Storage and transportation of fruit in better condition for consumption and to extend the period of consumption has already been experimented on and

many problems solved in their cold storage plant at Davis. These investigations will be extended and carried out on a commercial scale.

Cover crops adapted to varying localities and conditions will be tested in successive practice, together with soil moisture studies. In fruit drying and curing there is a wide variation in methods by different men. The university should equip a small dryer such as would be used by small men and discover the best methods, trying all. A state survey will determine the primal importance of these problems.

Dr. W. L. Howard spoke of the preliminary experiment work that had been going on at the University Farm for the past four or five years which will be of value to the new field stations. The university proposes to work close to the fruit growers, and he is confident that a good accounting will be made such as to warrant a substantial furtherance of the movement. Some of our oldest unsolved problems are among our greatest ones. Fall and winter operations will mark the beginning of operations as no money is available from the new appropriation till September.

Mr. Woodard, the chairman, who was congratulated on the successful fruition of his efforts, said that he handed over the responsibilities to the university with pleasure and relief, in the full confidence of useful results following the united efforts of the growers and the men of science.

Prunes Precocious in Tulare County

(Written for Pacific Rural Press.)

There is a 100-acre block of young prune trees just out of Visalia on the Hanford Road that is something of an eye-opener for people coming from the prune sections, because of the luxuriousness of wood-growth and for the large crop of prunes on three-year-old trees. This orchard belongs to R. E. Hyde of Visalia. There are 60 acres of two-year-old and 40 acres of three-year-olds. The latter are bowing down with their weight of fruit and will have to be tied up—trees six inches through at the butt. They are headed very low, as all deciduous trees should be, particularly in the interior, and are well built on the best known lines. They have never been irrigated till this year—haven't needed it on this deep silty loam, but Mr. Hyde thought that in the face of a third season of very light rainfall and a large crop of wood and foliage, it would be wiser to start the season with a good moisture supply. So he has given the ground a good sousing, and when we saw it the third week of May it was worked down like an onion bed in splendid shape.

Pruning a Problem.

We asked Mr. Hyde how he was going to handle these young, heavily-cropped trees this year. They were already coming over like weeping-willows with weight of fruit. He said, "Of course I am going to tie them up right away, but the ends will still hang over. I am open to suggestions." As we said last year of the Farmersville section, prune growers here seem to have a pruning problem to solve themselves on these young trees that seem to think nothing of making a bunch of ten-foot whips in one year at this age. Probably checking by pinching back quite sharply during the growing season the first two seasons might help some and throw more laterals and not thin too hard till the fourth year, even if some of the inside growth is choked out. Then when the tree comes to bearing heavily it can be lightened up and relieved of superfluous wood more rapidly. Mr. Hyde had wondered whether he should not relieve the trees of a portion of their crop to save their shape a little, but decided that the present prices warranted his leaving it on and pruning the trees back into shape if necessary afterwards. Twenty tons of prunes from 40 acres of three-year-olds would look pretty good.

The Older Orchards and Soil.

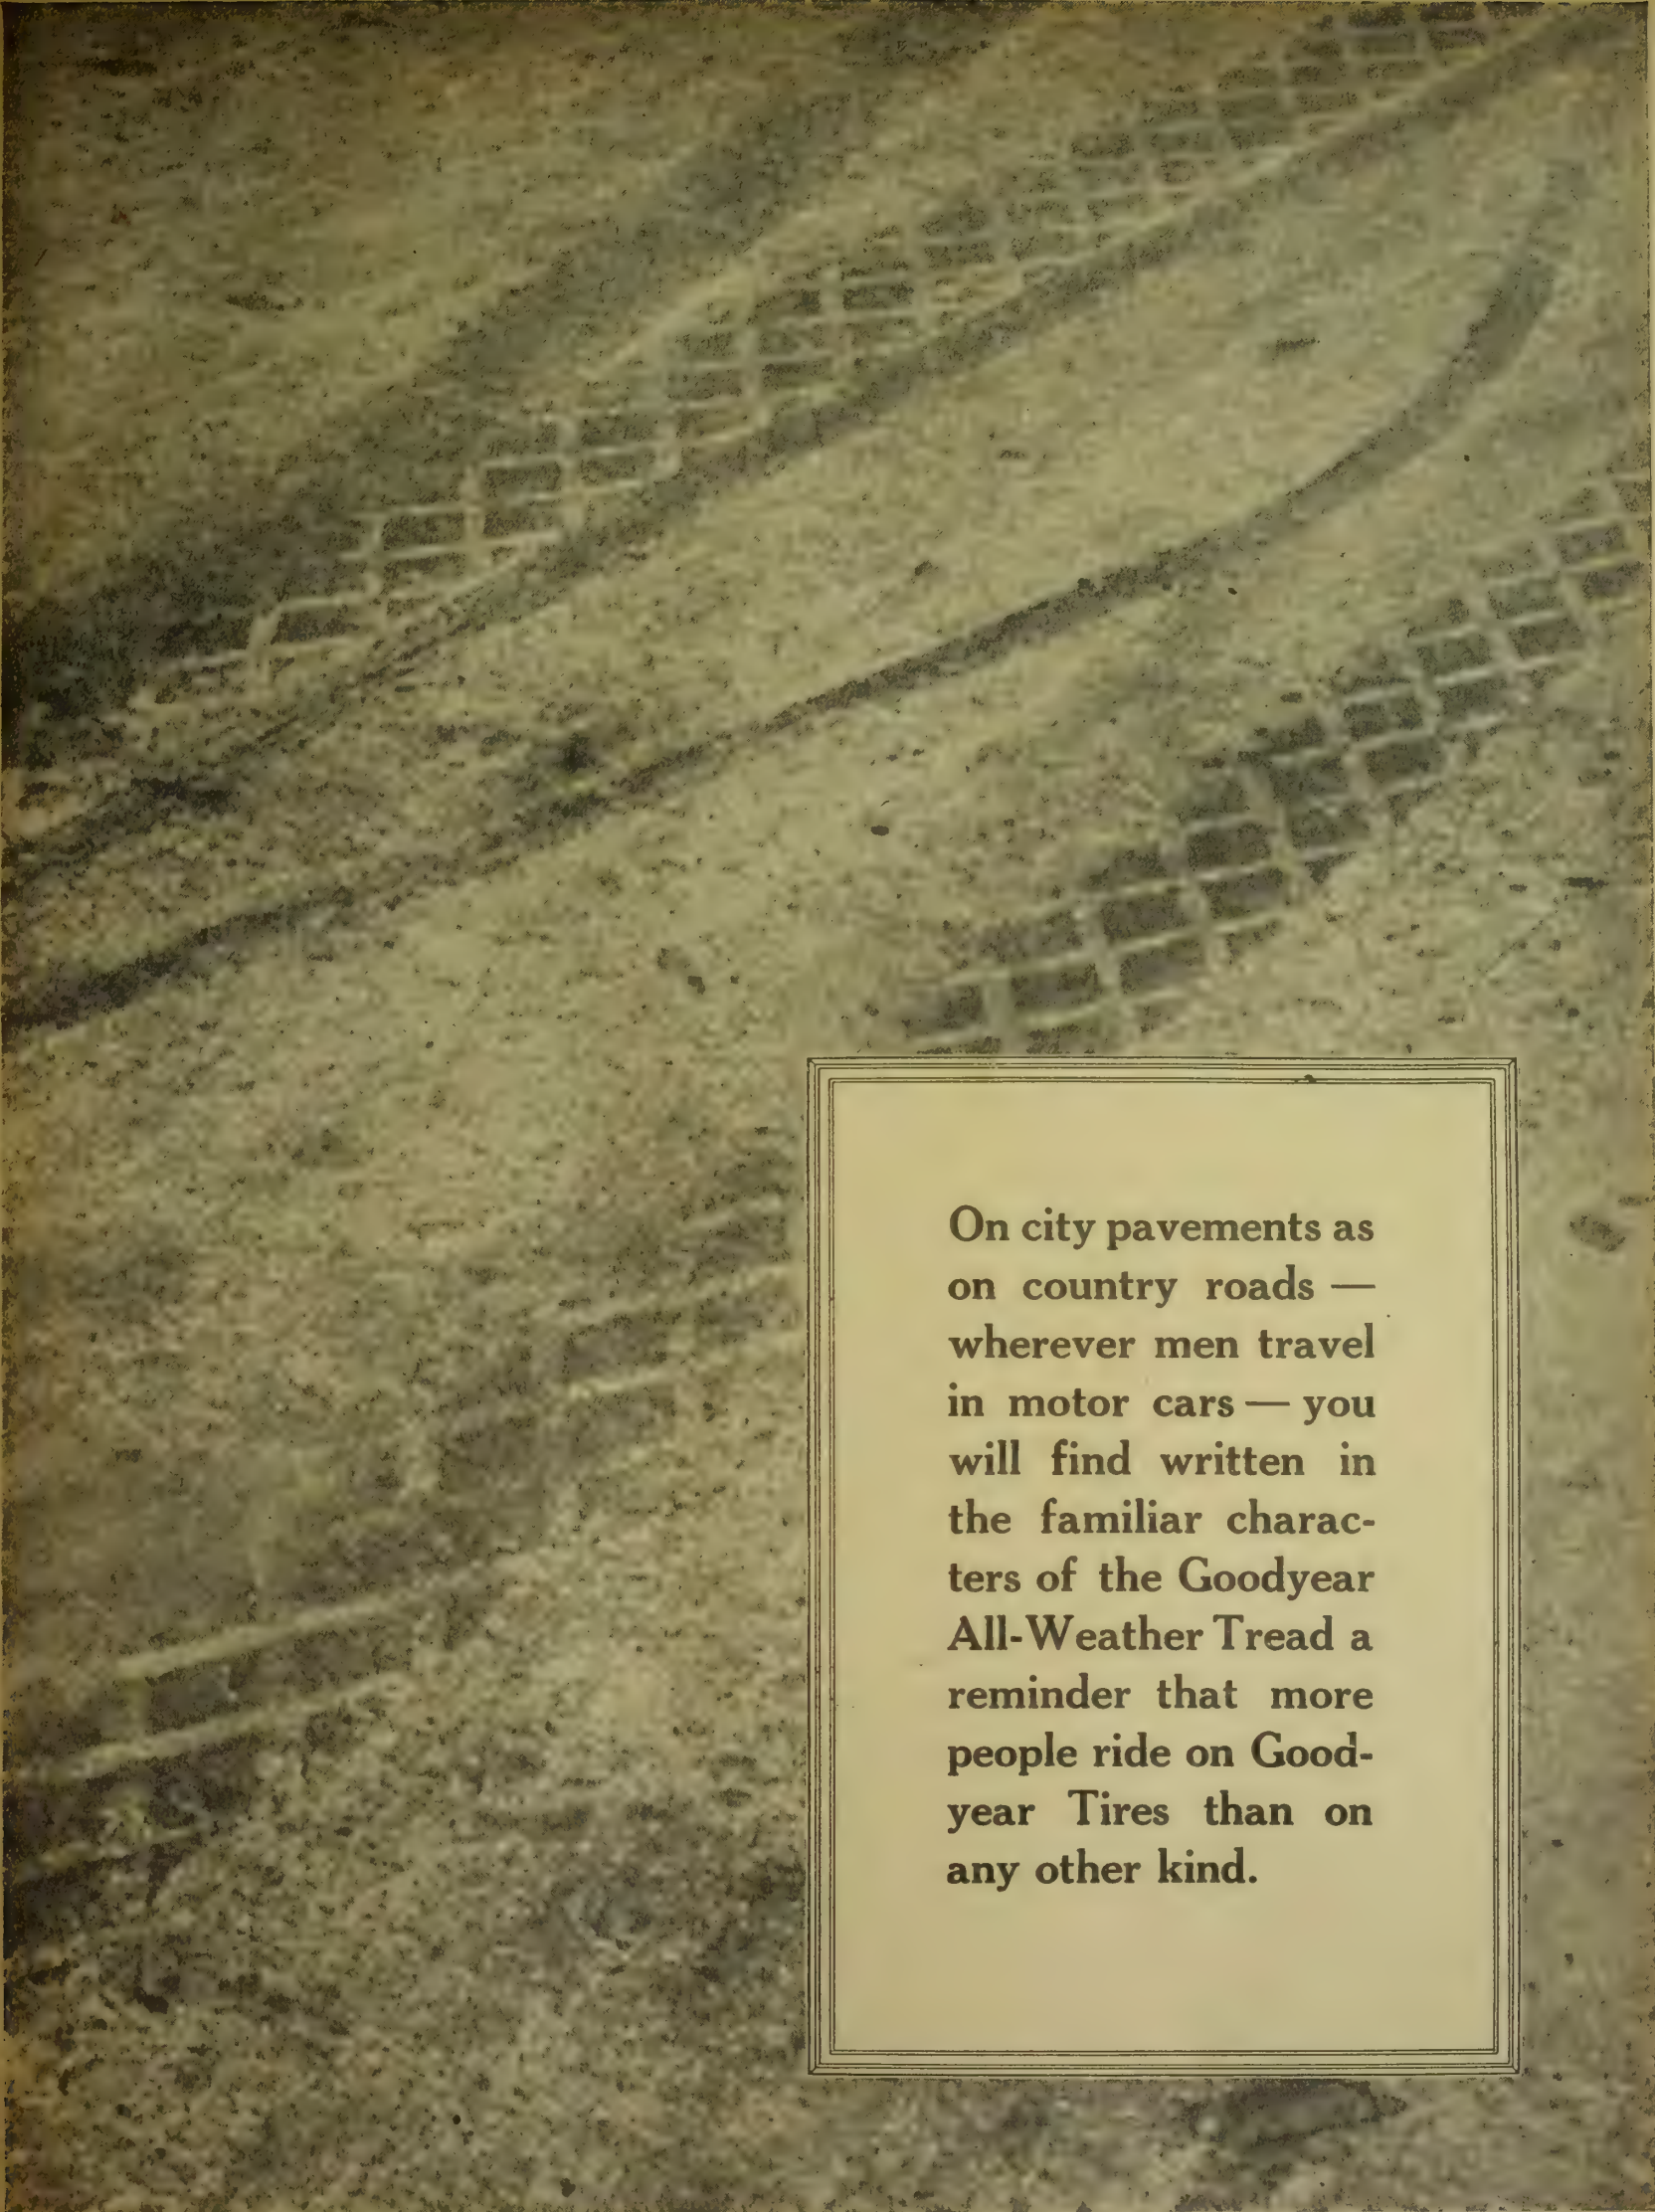

The silty loam soil and Hanford loam is from eight to fifteen feet above the clay—very strong and retentive

of moisture. A Cleveland tractor aids in the maintenance of a fine mulch. Like so many growers, Mr. Hyde finds the old-fashioned wooden clod-masher a fine implement to wind up with to follow his cultivating tools—double disk. It really is hard to beat, behind either spring tooth or disk on this class of soil—provided the clods have not got so hard as to need the pulverizer to break them down.

Of the 80 acres of bearing orchard here, 40 acres are 18-year-old French and 40 acres seven-year-old Robe de Sargent in one block. In the north these prunes generally prove pretty shy bearers unless there are enough French or Sugars to cross-pollinate. Yet last year 20 acres of these young Robes produced 37 1/2 tons of dried prunes. This year it is estimated that the same 20 acres will produce 45 tons—about \$10,000 worth.

Mr. Hyde contemplates planting out another 100 acres of prunes next year on similar soil and which he now has in grain. This will provide enough outlet for the activities of one live man when the whole is in full bearing. For orchards need close scrutiny and attention throughout the year to gain the best results. Just as a stockman rides through his flocks and herds, instantly spotting an animal that is off color, so must an orchardist watch his trees for any ailment throughout the year and endeavor to discover its cause and remedy. It is by the work of such painstaking men that our science of horticulture is enriched from year to year. We remember seeing Wm. Henderson (now dead) riding slowly up one row of his 90-acre pear orchard and down the next on his pony, watching the work of his pruners, scanning the twigs for insects and noting each tree as he passed with the practiced eye of the skilled orchardist. Just as stock thrive under the eye of the owner, so do trees thrive. Every appearance of unthrift is magnified in the owner's vision till he is bound to investigate the cause. It may be crown gall, lack of moisture, gophers, oak root fungus, poor drainage, or what not, but it is going to be investigated and the cause at least discovered.

The University of Arizona announces a field course in range livestock production from August 4 to September 6. The first week will be spent at the university and the remaining four weeks in studying the methods employed on some of the best ranches in Arizona. This certainly is practical instruction.

GOODYEAR
AKRON

Crop of Clings Worth \$1,000 per Acre

(Written for Pacific Rural Press by Jno. J. Fox.)

We want you to see what a ten-year-old peach orchard looks like that carries a crop worth about \$1,000 per acre this year. (See first page). This is the orchard mentioned in our issue of May 31, where "Scientific Control of Crown Gall" has been carried out. It is as even as it looks in the illustration. This orchard belongs to Hunt Bros., canners, and is situated at Linden in San Joaquin county.

Perfecting the Quality of the Fruit.

F. A. Dixon, the general manager of the company, explained that water properly applied is the secret of producing perfect canning quality in peaches. He says that a good irrigation should be applied to the trees just before picking. "Water late for quality." The Tuscan are irrigated about 20 days before picking, and Phillips about the same. He says that pink cheeks in the Phillips at picking time denotes quality. This is perfected, as stated, with water. If the color is lacking, then you know there is lack of quality. The whole of this place is irrigated from a well or over the levee. The well is 530 feet deep, but the lift is only 40 feet and a 50 H. P. motor delivers 2,500 gallons of water a minute.

Grading for Irrigation.

Mr. Dixon emphasized the importance of grading the ground for irrigation, not only for the saving of time and even distribution of water, but on account of the labor expense. We saw one portion of the orchard that was graded 100 per cent perfect, and a small portion that showed some inequalities of surface. They had been in a hurry to plant it at the time and let it go. It could have been graded for \$10,000 before planting, yet the extra expenses in irrigating had amounted to this sum in two years. Mr. Dixon's intention is to uproot a portion of this young orchard so as to grade it and then replant. The graded ground is laid off in one acre checks. Given the same area, one man can

look after the same amount of ground (graded) in irrigating, as takes 12 men on that which is ungraded.

Importance of Bud-Selection.

Mr. Dixon spoke of the great importance to be attached to bud-selection to preserve types, and looks forward to the day of State Experiment Stations and recognized sources of budwood where all nurserymen shall be served. He said there are half a dozen different types of Tuscan Clings in the orchard and that the use of untried bud variations leads to deterioration—mentioning in this respect the orange cling in Tulare county—probably due to bud variation and the taking of sticks from unproven trees; also the midsummer group. He has a very promising seedling which he has named the Paloro—a cling that equals the Phillips at its best, or any other cling, and which he now has out in orchard form.

Pruning and Thinning.

The pruning cuts in this orchard are most painstaking; consequently there is a minimum of wood rot. Careful thinning of the crop insures freedom from undersized peaches.

The perfecting of this lucrative crop has been brought about by: (1) Being planted on excellent peach soil; (2) good early training of the trees—a low head, vase system and long fruit wood; (3) care of all cuts wherever made and seasonable and thorough spraying; (4) thorough irrigation and subsequent care; (5) careful thinning of the fruit; (6) cover croppings. The highest fruit can be picked from the sixth step of a ladder.

There are doubtless hundreds of peach orchards in the State that can duplicate the returns shown here. But it must be remembered, that this year creates a record for fruit prices never before approached and which may never recur. To buy property or plant trees on the strength of these figures is out of the question.

Horticultural News Notes

A new peach has been developed in Success Valley near Watsonville that is said to ripen in late October.

J. P. Downs of Pleasant Valley (Butte county) has this year sold \$175 worth of strawberries from one eighth of an acre.

The first delivery of dried apricots in Fresno county was made June 25 by B. Boranian, who delivered two tons to Rosenberg and Co.

The apple crops in England and France are said to be short, owing to continued dry weather, and we shall again have fair fields for marketing.

A car of future dried peaches was sold at 16½ cents for choice, 17 cents for extra choice, and 17½ for fancy in New York, and two cars were sold at the growers' export prices.

Speculators in the San Joaquin Valley are said to be paying \$75 a ton for Malaga grapes, which last year sold for \$40. Emperors bring \$125 a ton compared with \$50 last year.

After the grasshopper campaign was under control in San Luis Obispo county 980 dead hoppers were counted on one square foot of ground where they had collected under some trash.

The orange crop in the Porterville section promises to be 25 per cent larger than that of last season, in the opinion of W. L. Crow, a local packer. The Valencias are set heavier than the Navels.

Some canning plants report that their entire pack for this season has already been sold—an indication of the strong demand for California fruits. They are now getting busy on apricots.

Ten cents a pound for Royal Annes, Bings and Lambert cherries is this year's price at Eugene (Oregon). Last year 6 cents was paid for Royal Annes in this district and less for Bings and Lamberts.

Modesto has been shipping carload

lots of apricots to Eastern markets—a new departure, for she has generally shipped to the canneries or dryers. The high prices on fresh fruit have been alluring.

"Future bleached Thompson seedless raisins (October-November shipments) were reported to have been sold at 20 cents; Coast and soda dipped at 17 cents, according to the New York Chamber of Commerce Journal."

Alameda county's currant crop was heavy and realized good prices this year. Prices ranged from \$12 to \$13 and drawers have sold around \$1. They are said to have met a ready sale even at these prices.

University lecturers will find fertile soil for their seed of wisdom in addressing the boys and girls in the various fruit harvest camps this season. They will do it if earnestly requested to the interest and profit of the young workers.

Forty-eight dollars and sixty-nine cents for 12 crates of apricots was the net price paid the grower—L. Anis at Lodi, on June 24. The fruit was shipped through the Earl Fruit Company. This is over 20 cents a pound f. o. b.!

Layne and Bowler Corporation of Los Angeles, manufacturers of turbine deep-well pumps, have opened a branch office in Modesto. This local station will handle the installation and service on the pumping plants in this district.

Kings County Peach Growers, who had their fruit contracted for a term of years at \$22.50 per ton, have had the price doubled gratuitously by the canners, making \$45 a ton in all. Terra Bella growers contracted their Phillips Clings at \$65 f. o. b.

It is hoped that hay and grain men will make an effort to save all the burr clover seed they can this year. It will be needed and be worth cleaning. There was a distinct shortage of

burr clover seed last year for men who wanted to sow it for cover crops.

Two hundred and seventy acres of vineyard (the Pusey ranch) east of Fresno has been sold to the Goorabian Bros. for 200,000. The vineyard consists of Malaga, Muscat, Zinfandel, Emperor and Thompson Seedless grapes and is in one of the best vineyard sections.

Walnut trees in the vicinity of Oxnard have been attacked by the fruit tree leaf-roller, never previously found on the walnut and generally confined to apple trees. This report comes from E. O. Essig, the well-known entomologist now stationed in Ventura county.

The final settlement of the peach association with members amounted to over \$900,000. The prices growers obtained last year were from 10½ to 11½ cents a pound. The opening price for this year's crop will be named soon according to J. F. Niswander of the California Peach Growers' Association.

Tulare orange growers received the largest aggregate sum for the 1918-19 crop net, ever recorded in spite of the comparatively short crop; the Porterville section is said to have totalled over \$2,000,000. The three exchanges in the county will probably total \$5,000,000 in payments to growers.

C. J. Kuhn of San Jose has been dusting his pears with the new Goleta Kaolin and Black Leaf Mixture for mites and slugs. These dusting experiments on deciduous fruits will be watched with much interest by growers. No live slugs were to be seen on Mr. Kuhn's young trees after the dusting.

Loganberries, blackberries and raspberries are now in the market in large quantities. The Japanese strawberry growers who were penalized earlier in the season for short weight in baskets by the Sacramento Horticultural Commissioner, have profited by the lesson, and no more crates have been confiscated.

The arrival in Fresno of 25 or 30 fruit jobbers from the East six weeks ahead of their usual time is an unheard-of thing, according to C. E. Campbell of the Stewart Fruit Company, and indicates the great demand there is already for our green fruit. Peaches will be the first big shipments East—probably about July 20.

Shipments of cantaloupes from Imperial Valley are decreasing as the season advances. The remarkable success of growers in this section is due to standardization and strict inspection. The buyer in the East now knows just what he is going to get before he sees it. Which makes a quick and stable market with a minimum of loss.

The Mountain View district (Santa Clara county) is going to have a boys' camp for fruit harvest, according to Editor P. Milton Smith of the Mountain View Register, who with Mr. Holman of the First National Bank assured the Berkeley Y. M. C. A. that the schoolhouse would be available for camping if no better arrangements shall have been made.

WOULD KEEP SILENT.

Cassidy (after the 17th parade): An' how did Oi look to ye on the horse, Dinny?

ASK FOR ILLUSTRATED FOLDER No 25

Farm Owners' and Operators' Nat'l Assn.

(Written for Pacific Rural Press.)

A new packing shed for fruit and grapes is being built at Waterloo, ten miles east of Stockton, in hope that a freight rate may be gained less discriminatory than the one now in effect. There has been considerable fruit development in this section, but a freight rate of 70 cents per ton has been charged for the haul to Stockton. The local unit of the Farm Owners' and Operators' National Association recently held a meeting at which the shed and a better freight rate were promised.

Dependable Crop Estimates.

By reason of the careful classification of the acreage signed in membership, the Farm Owners' and Operators' National Association will be in a position by next season to make accurate crop estimates in the different counties. The separation of orchard, vineyard, grazing and general agricultural lands makes easy a postal card inquiry on the kind and quantity of crops. There is no reason why within ten days, at the proper season, there should not be a close approximation made of every class of crops. This fits well to the purpose of the association to ultimately have its own statistician and provide the members with reports on crop conditions, to be followed by explanations of market conditions and prospects.

Association Progress.

A review of the work of the association the last 60 days shows that in more than a dozen counties, from Santa Cruz and Sutter to Kings, well-known farmers are now moving for organization and work. Into every neighborhood the plans and principles of the Farm Owners' and Operators' National Association are being brought to the attention of the men who own and till the soil. Much of this friendly and understanding spirit has been created by meetings and personal interviews; but the work has an even broader scope in the fact that tens of thousands of pieces of explanatory literature have been sent through the mails to be read by the farmers at odd times. There is not a day but that the work is being advanced in some quarter, and not a day but that gratifying results are apparent.

Free Fruit Labor Bureau.

The acute labor shortage which looms before fruit growers has led the Santa Clara unit of the Farm Owners' and Operators' National Association to make its major work for the time being along the line of supplying workers needed. Miss Mary P. Richter, who did similar work in the valley last season, again has immediate charge, with offices in the Chamber of Commerce at San Jose. The service is free to all. A card index is kept showing what kind of work each applicant wants; and when farmers apply for help, the right parties are quickly brought together to do their own bargaining as to wages and conditions. Many of the floating workers who were placed last year by this office under auspices of the Y. M. C. A. are returning for similar placement this year, if they are the sort that made good. The other sort does not generally come back to the labor office.

But the floating population is not enough. High school boys and girls again have the opportunity to enroll in a systematic manner for fruit work. The Labor Bureau sent about 3,000 cards to the San Jose high school for students to fill out as they wish. These cards show the address, age, sex, and names of all applicants, indicate how long they wish to work, what kind of work they want, what sort of transportation they have, what sort of camping facilities can be provided, etc. These were returned before school closed, June 27, and filed alphabetically by sexes and in age classes. Last year, whenever a group of workers were called for, if the working conditions at the ranch were doubtful, an investigator found out before sending the boys or girls.

If not doubtful, he took them out and made the survey on arrival. Reports after the season was over were generally favorable from both sides. Employers came early to the Bureau this spring and the high school authorities, students, the Y. W. C. A. and Y. M. C. A. early began pushing on the lines. It seems better to give this work to our local American youth than to a floating or foreign population, if the work is done about as well, for it is developing them in citizenship at the same time, while the floating population has proved a menace to property.

Hints to Fruit Workers.

A circular addressed to applicants for work in Santa Clara Valley orchards and signed by the Farm Owners' and Operators' National Association, gives the following pointers: Growers usually will not employ workers without seeing them first. People wishing work should apply at the free labor bureau in the Chamber of Commerce rooms, San Jose. The apricot season begins early in July and the prune season follows closely with sometimes a short interval between. Picking apricots is paid for by the hour and is usually done by men and boys. Women and girls do most of the cutting, sorting, or packing as piece work. Some ranchers provide permanent buildings in which to house help, some provide tents, many, near enough to town, arrange transportation back and forth. Workers with autos and camp outfits will have an advantage. Those who have no camp outfits can lodge in San Jose. If they have small children, these can be cared for in a day nursery in town. There will be work in harvesting apricots, prunes, peaches, pears, apples, grapes, tomatoes, etc.

TWO IMPORTANT MEETINGS.

Two meetings in the county campaign for increased membership in the Farm Owners' and Operators' National Association were held during the last week. At Linden there was a good attendance Wednesday evening, despite the fact that harvest is under way in that section. J. M. Bigger, vice-chairman of the association, with Dave Young, John Tone, Herbert Smythe and William Thomas, directors, were present and made addresses.

Mr. Bigger explained the situation in reference to the Association's efforts to secure official recognition by the Federal grain corporation of a wheat grader for the San Joaquin unit. As a result of interviews, Mr. Bigger said that it would be difficult to secure an official standing for the grader, but the service might be installed for the convenience and satisfaction of members. The meeting endorsed, unanimously, the proposal that a grader be installed. The results of the meeting were satisfactory in the acreage signed.

Saturday evening at Atlanta, which is a great grain-grawing section, a number of prominent farmers met to consider organization. Some took this, their first opportunity, to inquire into the Association plans. The results were very satisfactory, and an invitation was given the Association officials to return at the close of harvest and put the district in strong on membership.

A shortage of labor having developed in the orchards around Bellota and Linden, appeal was made last week to J. M. Bigger, of the Association, to see what could be done in securing the help of young people from the High School. Mr. Bigger at once took up the matter with the principal of the High School, and it is expected that the emergency will be met by prompt action. A system of registration is proposed and if necessary cars will be put on to take the young people to and from the orchards.

A remarkable situation has developed in the Escalon section, the extreme south side of the South San Joaquin Irrigation district. Armenians have entered the section and purchased a number of wine grape vine-

yards, paying strong prices. They have not disclosed their plans, but it is believed that they have one for drying grapes for use after the dry law becomes effective. The Escalon section is believed to have been selected for the experiment on account of its dryness and certain elements in the grapes. While there are many fine vineyards in the section, it has never been in any way distinctively a wine-growing country, and the movement has come as a surprise in many quarters.

The San Joaquin Unit has entered on its system of classifying all acreage as to vineyards, orchards or general agricultural lands. The card system adopted is to be used in making crop estimates and reports. The name of the farm owner, his postoffice and phone number, his acreage and crop prospects can be secured from every part of the country within 48 hours. A basis is being laid also for statistical information of more general character. As soon as the system is perfected it will be recommended for use in the other counties, to the end

that the State office may make independent and dependable reports.

Water!

All you want the year round wherever you want it—for house, barn, field, any place. Bore your own well, as thousands have done, with our time-tested

Standard Well-Boring Outfit

Easily operated by hand. Bore wells 8 to 16 in. dia., up to 100 ft. deep. One man bought outfit 8 years ago and has bored over 25,000 feet of wells.

BORES 100 FT. WELLS BY HAND

Make \$20 to \$30 per day boring wells for neighbors—easy to get 50 cts. to \$2 per ft. E. C. Cole, Porter, Okla., writes:—Have just bored 41 foot well for neighbor in one day and made \$41.00.

Why Burn Coal or Wood?

when you can have all the cleanliness and convenience of city gas? An Oliver Oil-Gas Burner will change your range or stove into a gas stove.

Just put into the firebox, fill the tank with kerosene or coal-oil, and it's ready for use.

There is an Oliver Burner to fit any stove.

Economical. Cooks and bakes quicker and better than coal or

wood. Turns on and off like gas. No fires to start. No kindling, coal, wood, ashes, smoke, dirt, or soot. Saves hours of work daily. Absolutely safe.

Oil Burners in use eight years ago are in use today. Thousands sold every year by mail. Don't experiment with cheap articles—buy a Burner that has proved satisfactory for years by thousands of users. Ironclad guarantee. Burners shipped upon receipt of price.

GOLDEN GATE WEED CUTTER

Kills the Weeds and Cultivates the Soil. Greatest weed killer on the market. Cuts them off clean, under the surface, close down to the roots. Besides, it breaks up the ground so thoroughly that one user says he saved \$200 in a single season because after cutting the weeds he did not have to plow. Cuts seven feet or less. Weighs but 230 pounds. Cut adjustable to any depth. Constructed of steel throughout. No other implement like it.

WRITE FOR CIRCULAR which illustrates and describes the Sigurd Weed Cutter and contains letters from many users.

Suggestive Agricultural Mention

(Written for Pacific Rural Press.)

Effects of Barley Exports.

A little light is shed on the reason for the stagnation of barley last season by reports of the U. S. Department of Commerce. During the ten months ending April, for 1917, 1918, and 1919, our exports were respectively 13,494,408, 22,476,016, and 9,586,531 bushels. Last year when the U. S. barley crop was 746,000 bushels greater than the previous year, our exports were 12,889,485 bushels less. The picking up of exports during May and June from California will probably continue until the mid-western crop comes in about September. Meanwhile 600 tons were sold the other day on the Los Angeles market for December delivery on a basis which would just about cover present prices plus storage, insurance, etc. The buyers, of course, believed that there will be no lowering of prices between now and Christmas.

Relative Importance of Foreign Beans.

Beans imported into the United States during the ten months ending April, 1917, totaled 2,489,656 bushels as reported by the U. S. Department of Commerce. For the ten months ending April, 1918, 3,097,251 bushels were imported. During the corresponding period ending April, 1919, 3,187,493 bushels were imported. Our biggest importations have been in our years of biggest crops, but practically no more were brought in the last period than during the same period the year previous. Of the beans imported during the ten months ending April, 1918, 693,495 bushels were exported. Of those imported during the corresponding period ending April, 1919, 1,300,051 bushels were exported. This would indicate that 1,887,442 bushels of foreign beans were either used or stored in the United States during that period. Six states in the United States last season produced 17,733,000 bushels of beans.

Small Lots of Wheat to Government.

Wheat growers who have less than carload lots and cannot sell direct to the Government at the Government price may still have that privilege in Stanislaus County, where the Farm Bureau is forming a wheat pool whereby small growers may ship in car lots.

Farm Courses for Disabled Men.

Seventy-eight "rehabilitation men," who have given their own bodies for their country, were registered in two special short courses, beginning June 9, at University Farm. Thirty-two more were received pending approval of application for training. The object of these courses and others covering most lines of farming is to enable men of ranch experience to acquire such technical knowledge in some field of agriculture as will enable them to overcome their disabilities. Three courses began June 20, one will begin July 21, one July 28, and two August 11. They last three to eight weeks each.

Alfalfa Dodder Controlled.

"I really no longer look upon dodder as a menace to alfalfa, and I will tell you why," said Farm Adviser O. W. Jarvis of Sacramento County recently. "I had been trying it out with cultivation in Nevada, and to make a definite test I deliberately sowed 40 acres to alfalfa in Nevada, the seed of which was about one-third dodder. It was immediately dubbed 'Jarvis' folly' and 'the dodder patch.' I sowed in the fall, got a good stand and irrigated in the spring as soon as it showed. As soon as it was high enough I ran the mower over it and let it lie, letting the surface get dry. Then I raked and burned the stuff and used a spike-tooth harrow over the whole and a spring-tooth cultivator carefully over the worst spots. Then I irrigated. A little dodder showed up again and I repeated the treatment. After that my alfalfa field was clean."

Wheat Rotated with Rice.

Watergrass is no longer a menace on certain kinds of rice land, as proved by General Manager H. G.

Beekler of the Dodge Land Company this season. It has been a common belief that no crop would rotate with rice. This has led to the practice of pasturing rice land for a season or two after it has become too much infested with watergrass to grow rice. About 2,000 acres of the Dodge properties were in this condition last year and no rice was attempted on this area in 1918. But at the suggestion of G. R. McLeod of the Sperry Flour Company, and also as the result of previous experiments by the Dodge Company, they tore up the land during last summer about six inches deep with a heavy Killefer cultivator pulled by a tractor. When early rains came, it was floated down, harrowed, and sowed. They have 1700 acres of Baart wheat with a crop estimated over twelve sacks per acre. The wheat makes nearly as much net profit as rice would on the same land if it had not been too weedy, and the dry culture kills the weeds.

Made His Own Bean Market.

To the Editor: Some readers of Pacific Rural Press might be interested in the method I used in marketing my beans. I had a small patch of teparies last year, and after watching the local market drop to ¼ cents per pound, I decided to use my crop to pave my roadway, and mend breaks in my ditches. By taking a trip into one of the bay towns and spending considerable time in explaining the best known and most satisfactory recipe for cooking this bean, I was able to see some tried in the local high school cafeteria. The advertising "took," and I was eventually able to place 26,000 pounds in this town. The grocers handling it retailed it at about 3 pounds for 25 cents, and my price was at about twice the San Francisco market quotation, and I have considerably more business in sight there.—Geo. L. Horine, Winton.

Grasshopper Poison Broadcasted. Grasshoppers have been reported in large numbers in some parts of Tulare and Kings counties. Poisoned bran was distributed by wholesale, ranchers using broadcast grain seeders for the purpose, and in this way covering a large acreage very evenly and quickly. One rancher said his hogs ate the poisoned hoppers with no apparent injury.

POISONING MOLES.

To the Editor: Surely you can poison a mole! For years my wife asked, "Why don't you poison the moles?" I said, "It can't be did, because they eat only worms." "But," says she, "they eat my corn and peas." "Oh, no," I replied, "they just destroy the roots, looking for worms. I have read books, and I am posted." So things went until one day my wife brought home a can of mole poison from the drug store. It was sealed airtight, and was canned peas, soft and poisoned. They killed the moles, but what was not used soon molded and spoiled. The next year the drug stores had none for sale, so I made my own, as follows:

Soak dried peas two days in water, then when soft sprinkle with poison. I used arsenic and "Rough on Rats," and then I put the peas in their runs, and also put some in the seed when I planted corn or peas, and I never have any more bother with moles. Whether they eat it or it acts as a charm like a rabbit's hind foot, I don't know, but it works.—H. T. B., Orland.

[They eat it all right. Some years ago the Oregon experiment station demonstrated that moles would eat peas, though they passed on other vegetables offered them.—Editor.]

AGRICULTURAL BILLS SIGNED BY GOVERNOR.

The following bills of agricultural interest were signed by the Governor. Their contents may be learned by reference to the sketches in our issue of May 17. The others which passed the Legislature were either vetoed or pocket-vetoed. Senate bills: 34, King,

estrays; 93, Feedstuff inspection; 319, Deciduous experiments, \$100,000; 364, Apple standardization; 513, Fruit and vegetable standardization; 709, Seed Potato Certification. Assembly bills: 38, Riverside University Farm; 168, Irrigation district electricity; 172,

net containers with proviso relating to raised-bottom berry baskets; 212, dairy; 215 and 413, Los Angeles Liberty Fair and Exposition; 645, walnut codling moth control; 1005, the hay bill; 1112 State Department of Agriculture.

POWER-SIMPLICITY ECONOMY

WATERLOO BOY

Original Kerosene Tractor

Dependable Power

that does not fail when your farm work has been delayed and you must take advantage of favorable weather and ground conditions.

Reserve Power

that's available in emergencies—for variable soil conditions or upgrade work.

Simple Power

which the experienced hired man can utilize to full day capacity, at any draw-bar or belt job on the farm.

Economical Power

that insures low operating cost—works all day under full load on 18 gallons or less of cheap kerosene.

Built to Standard Quality

Waterloo Boy fully sustains the quality-fame attained by Waterloo Boy power machines in 25 years' manufacturing success. Backed by a plain guarantee from a responsible manufacturer. Two-speed motor supplies ample reserve power for three 14 in. bottoms, and belt power for all farm needs, including threshing. All working parts of the Waterloo Boy are easily accessible.

Our illustrated catalog contains convincing proof of Waterloo Boy success. Sent free—write for it today.

About \$2. a
Ton? It's
Like Selling
Dollar Bills
For 25c.

PUT NEW LIFE into your played-out land. Make a good profit on your biggest "by-product"—your straw stack. It has a fertilizing value of \$8 a ton, is invaluable for adding humus to the soil, and affords splendid protection for winter grains. For best results it must be well shredded and spread evenly. To make sure you do it right the first time, use the

Straw
and Manure
Spreader

NISCO
The New Idea

TWO
Machines
in ONE

This new one-man straw spreader attachment makes your Nisco a perfect spreader for straw, lime and all kinds of manure. The Nisco can be bought with or without attachment, or the attachment can be put on your old machine. The Nisco is the ORIGINAL wide-spreading spreader, always reliable, simple and durable, built for hard usage.

Loads and pulls without undue strain on man or team. Has solid bottom with chain conveyor. Drives with heavy sprocket—no gears. Have your Nisco dealer show you this machine which causes hundreds to write the kind of letters shown below. If you don't know him, write us for his name and free book on soil fertility.

NEW IDEA SPREADER CO.
Spreader Specialists Coldwater, Ohio

"My new NISCO was demonstrated today in presence of my neighbors. Was surprised to see how perfectly it handles both straw and manure. Did not think I wanted the straw attachment, but after seeing it work, would not have a spreader without it. Two horses pull the spreader dandy—no weight on necks. Must say the NISCO is all you claim for it."
I. W. DANTICE, Colo.
(Address on request)

"I have one of your spreaders and use the straw spreader attachment on it. By actual experience, I have raised more and better wheat on heavy clay soil where I had applied wheat straw or clover chaff after the wheat was sown in the fall, than where I used fertilizer right by it; and invariably we were successful with clover on straw covered plots."

(Address on request)

NEW IRRIGATION METER.

(Written for Pacific Rural Press.)

Due to the friction between water users and ditch tenders or the irrigation companies who employ them, on account of disputes as to quantity of water delivered, many irrigation systems are installing meters as fast as practicable. A new meter, characterized by low cost, small size, and simplicity of installation is now on the market. It is about the size of an automobile speedometer with a recording counter similar to one used on a bicycle. The same instrument is used to measure the water running over any sized weir, adjustments for different sized weirs being made in the gearing of the counter. This fact is made possible by the fact that it is

There are only eight parts in the Lyman Irrigation Meter, and it weighs less than six pounds. About the size of a speedometer, it is very easily installed by the water user without special tools, and records in acre feet the quantity of water passing over any weir.

operated by the pressure head. Its intake is inserted through the weir board six or more inches from the side of the weir opening and two inches under the crest of the weir. A screen and protecting drum keep out trash, and the speed with which water runs through it prevents deposit of any silt. With a maximum head of one foot, the meter begins recording at 0.15 of a foot. With its intake set for a maximum head of two feet it begins recording at three inches depth of water over the weir. Gearing has been calculated by its inventor, Ray J. Lyman of Berkeley, for Cipoletti and rectangular weirs and for orifices of various types. Mr. Lyman has had seven years' experience as irrigation engineer on several Government Reclamation projects.

THE OPEN-MIND IN AMATEUR FARMING.

This is just to let you know that I like your paper more and more the longer I get it. I don't always agree fully with your editorials, but I read them and all the reading matter from "cover to cover." All the helpful things I read in it make the few editorials with which I do not agree shrink into insignificance.

"A Rural Vision of Soil Science," by Albert F. Etter, in your May 17 number, surely was read with interest. It was written in language that most people could understand, including amateur farmers. We have used some lime in our garden, but I don't think it gives any results nearly like plenty of stable manure. And with only one cow, you can imagine we do some hoarding, so that no manure is wasted.

Good Use for Leaves.

We have some of the trees here that Mr. Etter mentions—manzanita, madrone and live oak. We use the dry leaves for bedding, as we can't raise our own straw here—much less buy it.

Goat Manure.

We have a neighbor who has goats. The rest of us have a prejudice against goats for several reasons, the chief one is that they can do plenty of damage if not well fenced in. We believed that the ground they went over much would be "spoiled" for growing anything. Now Mr. Etter must know much more about it than we do, and we will have to change our idea that goat manure is injurious to the soil and we owe our neighbor an apology on that score.

Nature or Sharks.

No doubt there is much to be gained from studying Nature. But when I find my garden soil getting as "hard as

a rock" and plenty of other things coming up to take the enthusiasm, for farming out of one's heart or mind, I'm more likely to think of the ways of real estate sharks than the "ways of Nature." But just the same I'm glad there are plenty of folks who make a success at farming, and so we disgruntled amateurs don't count. We can read the Pacific Rural Press and after awhile we will be more efficient in handling our problems.

I hope Mr. Etter will write some more letters to the Pacific Rural Press so that we may learn some more things about making "land as poor as a pile of sand as rich as a garden." We surely need that knowledge.

**QUICK AND ECONOMICAL TRANSPORTATION**

FARMERS appreciate the value of the electric lighting equipment, a feature of all Nash trucks. Night work, so often necessary on the farm, is thus made practical. The electric starter, another important feature, not only saves the driver's time, but cuts down fuel expenses as well.

The internal gear drive axle of Nash trucks transmits power with a minimum of loss from motor to driving wheels. This is one reason owners give for their satisfactory performance.

The Future of the 1919 Wheat Crop

(Written for Pacific Rural Press.)

GROWERS CAN INSIST ON FAIR PRICES FOR WHEAT.

The United States Grain Corporation will enter into contracts with wheat buyers. One clause of the contract designed to furnish a method by which the producer may satisfy himself that he is receiving fair treatment in grade, dockage and price, is produced herewith:

"The Miller (or Dealer) in buying wheat from the producer, shall purchase on the proper grade and dockage under the Federal standards, and shall pay therefor not less than the guaranteed price based on such proper grade and dockage, at the terminal most advantageously reached, less freight, and less reasonable handling margin. The Miller (or Dealer) shall keep a record showing all purchases from the producer, name of the seller, date, quantity, grade and dockage fixed and price paid and reasons for fixing grade under No. 1, including test weight; and on all parcels of wheat on which there is a dispute as to grade and dockage or price between the Miller (or Dealer) and the producer at the time of delivery, a notation thereof, shall be made upon the records of the Miller (or Dealer), and a sample shall be drawn by the producer and the Miller (or Dealer) and forwarded in a proper container to the Vice-President of the Grain Corporation, in the Zone in which the purchase is made, for his use in the determination of the dispute. The determination of the Vice-President shall be final and conclusive unless an appeal from such determination be filed within ten days with the United States Wheat Director by either the producer or Miller (or Dealer). In case of appeal the decision of the United States Wheat Director shall be final and conclusive. The Miller (or Dealer) shall keep a copy of this section prominently displayed at his place of business."

It is hoped that buyer and seller will harmonize any differences by mutual agreement, but in cases where this is not possible, the following directions for making use of the provisions of this clause in the contract should be followed:

A sample of the wheat under dispute should be forwarded to the Grain Corporation, 343 Sansome Street, San Francisco, with card enclosed giving the following details: Date; name and address of buyer; name and address of seller; bushels under dispute; grade and dockage fixed by buyer; grade and dockage claimed by seller. Such samples should contain at least three pounds, so that a proper test-weight can be ascertained, and in the case of all samples in which excess moisture is a factor, at least part of the sample must be forwarded in an airtight container.

The Grain Corporation office will promptly, on receipt, advise both buyer and seller of their opinion as to the proper grade and dockage, and in the case of sample wheat on which there is a dispute also as to the proper price, the Grain Corporation will express an opinion as to the relative value of such sample wheat as compared with the guaranteed basis standard No. 1 price.

Such sample will then be held for submission to the Wheat Director, in case of appeal within ten days, as provided in this clause of the contract.

The agency to handle the 1919 wheat crop will be known as the "United States Grain Corporation." With the Presidential Proclamation of Peace the Food Administration automatically passes out of existence, and on July 1st the Food Administration Grain Corporation will change its name and continue to operate under the direction of the United States Wheat Director, Julius H. Barnes, with a capital of \$500,000,000, all subscribed by the United States Government.

W. A. Starr will be Second Vice-President, managing Zone 12, comprising California, Nevada, Arizona, and the Hawaiian Islands.

"That the government guarantee of the wheat price was undoubtedly a wise act is now realized," said Mr. Starr on his return from the New York conference recently.

"Farmers have responded by producing by far the largest wheat crop in the history of the country. Without the assurance of an adequate food supply which this surplus gives, it is difficult to imagine the condition of chaos and starvation that would confront Europe, with the reflecting evils in our own country. As a matter of fact, this big wheat crop of America is the salvation of civilization today.

"As evidence of the magnitude of the operations of the Grain Corporation under the leadership of Julius H. Barnes, in supplying the Allies and relieving the distress of the liberated countries of Europe, the total turnover for the past 18 months ending July 1st, will exceed seven billion dollars.

"The food which has measurably stabilized European society and government and kept the red flag out of Finland, the Baltic States, Poland, Czecho-Slovakia, Jugo-Slavia, Austria and Roumania, and saved the remnants of Armenia, was largely purchased and landed at the ports in Europe, by the Grain Corporation, making it possible to act quickly and comprehensively and with the least possible disturbance to home necessities. The West Carnifax, the first food ship to arrive at a German port, after the Armistice was signed, and carrying a cargo of flour, was shipped by the

Grain Corporation from San Francisco, and was used for the first relief of the starving people of Czecho-Slovakia, to reach whom it was shipped through German territory.

California Exported Flour.

"California, with a deficient wheat crop, and not raising enough wheat for home consumption, did nevertheless last year export through the Grain Corporation, to Europe, nearly two million barrels of flour, or almost ten per cent of the flour exports from the United States. This was made possible by the importation of large quantities of Australian wheat, accomplished by the splendid efforts of R. A. Lewin, of the Grain Corporation, who succeeded in obtaining vessels to move the wheat from Australia under very trying conditions.

No Wheat Imports This Year.

"This year there will be no imports of either wheat or flour, and the California wheat crop promises to be almost three times as large as last year, furnishing a plentiful supply for the flour mills, up to the limit of their capacity, and they will only be restricted in their operation by the ability of the Grain Corporation to sell flour for export.

U. S. Wheat and Flour Sales Policy.

"The Grain Corporation will sell all wheat for export and all flour for export to Europe, buying the flour from the mills on a competitive basis.

"The obligation of the Grain Corporation the coming year calls for protection for the producer in seeing that he gets a fair reflection of the government guaranteed price, and on the other hand, the protection of the consumer, allowing fair play for the grain and milling industries, and proper handling of the exports of the surplus. To ship this surplus out of the ports of the United States is going to tax their capacity to the utmost. Only the most efficient handling can prevent serious congestion. The Zone Vice-Presidents will therefore have full control over all seaboard warehouses and elevators, and through the co-operation of the Railroad Administration will direct the flow of all grain

to terminal markets and seaboard under a permit system.

"In case the crop is marketed both home and abroad on the basis of the government price, there will be no government control of flour mills', flour jobbers', or bakers' profits. With a plentiful supply of wheat and flour at all times, it is safe to count on competition to regulate profits and give the consumer a square deal, as all of these industries operate under unusually competitive conditions.

"However, in case of a resale of wheat or flour below the government price, made necessary by lower export value of wheat, or arbitrary reduction to the domestic consumer in price of the flour, machinery is provided by regulation of these industries and control of profit margins to make the reflection of the reduced price to the consumer absolute and immediate. It is understood that export wheat values and domestic flour prices are to be kept at the same level of value at all times.

"Judging from the comments appearing from time to time, the public does not seem to realize that the control of wheat has held the price down to the consumer, and at the same time, by stabilizing the price received by the producer, has eliminated speculation and paid him full value for the wheat."

Wheat Not Likely to Be Lower.

When asked if he thought the government would be resellers at prices well below the government price the coming year, on account of the big crop, resulting in large loss to the government, Mr. Starr replied: "As the situation looks today, I do not see why the crop cannot be practically marketed at the government price. Mr. Barnes has made an exhaustive analysis of the situation, and while it can change by the varying condition of crops between now and their maturity, it looks as if Europe would need over four hundred million bushels of wheat out of our coming harvest to get through next year, besides what will be available from other exporting countries. Last year's exports of flour and wheat were about three hundred million bushels.

"In view of the fact that most European countries have guaranteed their producers considerably more than our minimum price, it is conceivable that we might ask them more than our government price basis, since the United States will dominate as an exporter, holding the main supply, but as this would be national profiteering in a sense, it would of course not be thought of. Matters of finance will also largely control the market in which many European countries can buy. If our present outlook for the wheat crop is realized, we should have around six hundred million bushels of surplus, and after giving Europe what they will require, we will have left a comfortable carryover against the harvest of the following year. Assuming that Europe will need this supply, the only reason left for a lower resale price would be an arbitrary reduction to the consumer in the United States.

"I greatly doubt if this would accomplish the object aimed at, namely, to reduce the cost of other foodstuffs. For several reasons, wheat has an independent value as food, especially in Europe. Suggesting lower prices for wheat next year would tend to discourage the planting of another large wheat crop. Can we afford to take chances on small crops in the light of past experience?

"As farmers are now confronted with heavy costs in producing crops, it would seem unwise for the government to do anything arbitrary, tending to discourage the farmers' efforts in production. With the end of the coming year of control, we all confidently believe and hope that the grain markets and grain production can be returned to the natural operation of the law of supply and demand, which under normal conditions is the safest kind of regulation."

An unaccountably good demand for Bean tractors is reported through May and June of this year as against a dead season at the same time last year.

HORTICULTURAL JOTTINGS.

The American Consul at Vladivostok is of the opinion that an opportunity exists for American seedsmen to establish a profitable trade in Siberia where a scarcity of vegetable seeds exists. Japanese seedsmen are receiving large orders. Denmark and the Netherlands formerly supplied this market.

The British government has contracted for virtually the entire export production of butter of Argentina until the end of 1919 at a price of \$0.328 a pound.

The California Fruit Growers' Exchange handles about 55,000 carloads of citrus fruit and by-products a year for its members.

The Prune and Apricot Growers' Association has handled a business involving \$20,000,000 in the past two seasons.

The Raisin Growers of California may have a \$25,000,000 crop this year if all goes well. In 1914 it was worth about \$7,000,000. Yet the Associated Raisin Growers are finding a market for every pound, and are keeping the market "on the bite" at that. No wonder our co-operative associations are "all to the mustard." Watch them grow.

"Unstandardized," the apple crop was erstwhile sent to town; The fruit looked this way on the top
O O O O O O O O O O O O
And this way lower down:
O O O O O O O O O O O O

The demand for farm labor is slightly better than normal, while reports indicate that the supply in this state is 93 per cent of normal as compared with 80 per cent a year ago.

California wines again have a clear market in England in competition with other countries; the restriction having been again removed after three weeks.

THE TROUBLESOME LINNET.

To the Editor: Linnets are very bad here. They are eating apricots as fast as they begin to color. Can you recommend anything on a wholesale scale in a large orchard that will destroy them or drive them away?

Trays that have been stored all winter under cover show mold. What is best thing to do with them before starting to use again?—I. O. R., Morgan Hill.

We cannot suggest any method of destroying linnets in a wholesale way. We have known cherry men employ boys or Japs with .22 rifles, using fine shot shells for the week or two between commencement of ripening and harvesting. It keeps them moving and seems to pay, especially at present prices. Poisoning wholesale does not seem to be practicable or desirable.

Moldy trays should be scrubbed and dried at once. One pound of lye to 15 gallons of water—hot, if possible. Spraying alone on badly molded trays is inadequate.

APPLES IN NEW ZEALAND.

J. A. Campbell, Assistant Director of Horticulture, Wellington, New Zealand, is now visiting us to learn our methods of standardization, packing and packages and marketing of fruit—particularly apples and pears. Besides the Riverside convention he has spent some time at the canneries, the marketing associations of fresh and dried fruits, the packing houses, and horticultural institutions. He says that the larger South American apple trade, in abeyance during the war, will, he hopes, be recovered, now that trade routes have been reopened. Two items of interest which he mentioned in connection were: (1) That 98 per cent of the apples in New Zealand were worked on Northern Spy root as a protection against woolly aphis; and (2) that a species of mealy-bug occasionally infects the apple (fruit) and develops after the fruit is packed.

Mr. Campbell was impressed with the packs of fruit he saw in the packing houses, the convenience of the packages and their method of safe-loading in the refrigerator cars—also the method of icing and air circulation arranged for in transit. He said that the general impression gained in New Zealand was that we harvested our ice in the winter. The \$650,000 icing plant at Roseville was a revelation.

Agricultural Notes

The Kansas winter wheat crop is estimated at 229,217,000 bushels.

Lima bean growers, representing about 12,000 acres around Sawtelle, Los Angeles county met last Saturday to ask Congress for a tariff on Asiatic beans.

An effort is now under way to form an irrigation district in the Inyo-Kern district, by getting water from Mono lake. The climate and soil there are said to be ideal for alfalfa.

The California Tomato Growers' Association has begun to make further cash payments due growers for last season's crop. This will make 75 per cent of the money due for last season.

In a fire of unknown origin, which burned over pasture and grain covering an area of Fresno county, nearly six square miles in the Orange Cove district, property valued at over \$10,000 was destroyed.

Indian corn market prospects are fine. U. S. acreage is the least in ten years and the high hog prices are creating about the strongest demand. Old stocks will be practically gone when the new crop comes on.

"The schools must make democracy

safe for democracy." is a note printed on letter heads used by State Superintendent of Public Instruction Will C. Wood. Eternal vigilance is necessary to maintain such a standard.

In 1910 the total wheat crop of Alberta province of Canada was less than one million acres. This year the estimated area under wheat is 4,293,000 acres on which the average crop is claimed to be about 20 bushels per acre.

A note is going the rounds of the press that millers know the price of wheat will be no greater next week than it is today. This is wrong. Nobody knows that; and if demand justifies it, there is no upper limitation on prices.

The Terra Bella Canning Company has contracted to pack the crop from 150 acres of tomatoes at Lindsay, the crop being estimated at 1,500 tons. The Terra Bella Cannery will begin the tomato pack the last of August.

Grain growers will be allowed but 4½ cents per bushel for bags this year, instead of 9 cents, the amount fixed by the government last year as the allowance to the shippers for the cost of bags, says R. A. Lewin, zonal agent of the food administration grain corporation. The reason for the cut

is the present proportionally low cost of bags.

The decision of the United States Supreme Court in the Lake Hemet water case having determined the points at issue in the various suits brought in connection with the practices of the Crocker Huffman Land and Water Company, the Railroad Commission has ordered a dismissal of the several actions relating to Crocker-Huffman pending before the commis-

sion. The Goodyear Tire and Rubber Company of Akron, Ohio, are to establish a tire factory and cotton mills on the Pacific Coast. The plans include the manufacture of all tires and rubber goods sold on the Pacific Coast, as well as those exported to the Orient. The factories will use the entire output of Egyptian cotton of the Imperial Valley and Salt River Valley of Arizona.

TO PROTEST AGAINST ASSESSMENT.

Bearing fruit trees have heretofore been assessed at 50 cents each for taxation purposes in Santa Clara County. At the last assessment this valuation was raised to \$1.00 each.

When the County Board of Supervisors sit as a Board of Equalization this July, they will be met by a committee of leading farmers, appointed by the Farm Owners and Operators' Association, who will protest more powerfully than farmers would be able without an organization such as this. The committee consists of E. L. Fellows, R. P. Van Orden, R. V. Garrod, A. N. Lantz and J. J. McDonald.

CALIFORNIA LAND SHOW OCT. 4 TO 19.

The California Industries and Land Show is to be held October 4 to 19 in the Exposition Auditorium, San Francisco, under auspices of the Home Industries League. The Land Show Committee includes F. L. Washburn of the Western Meat Co., F. D. Fagan of the General Electric Co., R. R. Rogers of the Rogers Chemical Co., and Edward H. Brown, general manager. The premium list includes all products of the State from agriculture to toys. Two-thirds of the space allotted to manufacturers has already been sold according to Mr. Brown. Band and orchestral concerts, free moving pictures, special county celebrations, lectures on horticulture, agriculture, and livestock will be events of the show.

WATER AND FEED

The question of water and feed is the farmer's greatest worry. Stock must have both. A hot day in summer without water; or a scarcity of feed for a few days in winter can easily wreck your dairy profits for the entire year.

Dairy cows will not give milk unless properly fed. The surest way to feed is from a silo. By putting your green crops into ensilage you have a feed that is more nourishing, goes farther, and is an insurance against shortage during the winter. It is the one logical way to feed a dairy and is the secret of dairy success.

The Pacific is built to meet every requirement, give maximum service and yet be sold at a reasonable price. It is strong, serviceable, convenient, and will last a lifetime.

Pacific Silos are built of well-seasoned 2-inch Redwood staves with strong fir door frames. Heavy steel hoops with cold upset threads and malleable iron lugs. Other Pacific features are self-supporting cover; hinged ventilators; hingless doors and iron-tongue splicing. Foundation plans are furnished with every silo.

Investigate the Pacific. It's a perpetual money maker and safe investment.

HOW ABOUT THAT WATER TANK?

Let the Pacific Tank take care of your needs. Put in a system and have water all the time and where you need it. Water for your stock, dairy, kitchen, bath and lawn. A life-saver in case of fire.

PACIFIC TANKS

are built of heavy Redwood and bound with large steel hoops. Strong and everlasting. Fitted with patent non-shrinking system. Cannot shrink, leak, or burst. Always tight.

Write us about our non-shrinking system. Find out why it is that a Pacific never leaks. Write today.

DRY FALL PLOWING MAKES GRAIN.

Tom Dale, who is farming in the Alpine section out of Mountain View, has a "ripping crop" of barley and wheat this year where he had a good crop last year, both being grown without irrigation. He always plows early in the fall and plants grain before the rains, according to H. G. Knapp of San Jose. Having a tractor that should be kept busy after his own work is done, he plowed later for a neighbor, turning under a volunteer crop that would have made more grain than will be taken from the same field this season, because it was sown too late. Nine seasons out of ten a good annual grain crop will be obtained in these hills by early plowing, says Mr. Knapp, although in some of the lowlands the same practice might drown out the crop not over once in five years. Where dry plowing does not have other drawbacks, it certainly pays to use a little more power; if necessary, and have it done while the footing is good and while seeding may be done on time.

SHOCK ABSORBER BUSINESS BRISK.

About 2,000 sets of Hassler shock absorbers per month are being sold for Ford cars in California, according to President Frank C. Kip of the Distributors Corporation, which handles this business for California, Nevada, Oregon, Washington and Idaho. This concern has been organized only since February, the previous agency having been less aggressive. Of the 283 Ford dealers in California, eighty per cent are now selling Hassler shock absorbers, and most of them are under contract to take a certain number per month. Of the 532 dealers in the territory mentioned, nearly 400 are signed up in this way. An ample stock is now on hand, which was not the case when the writer ordered a set for his own car recently. We can say emphatically that we had rather have the shock absorber than the money they cost.

GAS LOW—STUCK ON HILL.

On a hot day in the hills of Contra Costa county our gasoline became so low and a hill became so steep that the carburetor went dry. We could have continued up hill if we had been prepared, as suggested in the Mo-hawk Messenger, published by the Mo-mawk Rubber Co. Get an extra cap for the gasoline tank, drill a hole through it big enough to thread so an ordinary inner-tube valve can be screwed in. When you get stuck, as we were, put this cap on and pump a little air pressure into the tank. It will force gasoline to the carburetor and boost you up the hill. Avoid too much pressure, because your tank might blow up.

ADJUSTABLE IRRIGATION DAMS.

Instead of the ordinary tappoons used for checking water in irrigation ditches, L. Langstroth of the Triangle Ranch at Empire has recently installed four adjustable Calco irrigation dams. The adjustable feature makes possible the use of these dams in ditches of varying widths without damaging ditch banks and without carrying a depth from 8 1/2 to 32 inches, and in wide range of tapoon sizes. Each dam consists of two blades of rust-resisting heavily galvanized iron with a central supporting angle iron which renders construction rigid and facilities placing the dam in ditches or canals. Five sizes are available, varying in width from 21 to 69 inches, in weight from five to 43 pounds.

MORE COWS PER TRUCKLOAD.

There is plenty of room on the ordinary motor truck for five head of cattle instead of the two or three commonly hauled per trip by turning

them loose in a box body. To carry five or even more per trip, make stanchions along the sides and let the cows' heads project out over the road; alternate animals facing opposite directions. The fixed side of each stanchion projects downward through a strap iron fixed on the side of the body. All stanchions must be well braced crosswise of the truck to avoid dumping the whole load if all the cows should be overbalanced in that direction on a sharp curve or sloping road.

CASE THRESHING MACHINE MERGER.

A merger of the Grand Detour Plow, Company of Dixon, Illinois, in the J. I. Case Threshing Machine Company of Racine, Wisconsin, has been announced by the latter concern, all arrangements having been completed to take effect as of July 1st.

The J. I. Case Threshing Machine Company has handled Grand Detour plows for several years past, and the line has proven so entirely satisfactory that it has seemed the part of wisdom to merge the two concerns. The Threshing Machine Company will continue the operation of the plant at Dixon, leaving it under practically the same management as before.

AUTO TRAILER FIRE DEPARTMENT.

The entire fire department for the town of Dunnigan, Yolo county, and the country roundabout is a two-wheeled auto trailer kept in the local livery stable ready to hitch to any auto that comes along. The body of the trailer is about 4x6 feet and 18 inches deep. It is partitioned to hold five ten-gallon cans for water and for chemical re-charges to be used in the ten chemical fire extinguishers, each of which is kept in its own compartment. Between the cans and the extinguishers is space in which are kept three iron rakes, half a dozen shovels, and a bunch of old sacks.

SMALLER DISK PLOWS FOR DRY SOIL.

A 24-inch disk plow works much better in dry plowing than a 26 or 28 inch disk, said H. G. Knapp, the power-lift tractor disk-plow man of San Jose, as he laid a rule across the edges of disks of the various sizes. "See, when a 24-inch disk is an inch deep in the soil it is cutting dirt on an edge about eight inches long. A 28-inch disk going an inch deep is cutting with an edge a foot long. I made a special two-disk plow for heavy bean land in Los Angeles County just before the tractor demonstration there last fall. It was 28 inches in diameter and it wouldn't do anything in that hard dry soil. It weighed just a ton, including the load. I put 24-inch disks on and they plowed the soil fine."

ENGINE FOR GARDEN IRRIGATION.

All night long the dependable little 3 h. p. Z engine popped its steady music at the pump belonging to Geo. H. Uhl of Coalinga. It was belted to an Eclipse well gear, which worked a lever arm and kept the plunger pump throwing a good stream into a couple of metal tanks. At pleasure, Mr. Uhl was enabled to irrigate about an acre of alfalfa, a small commercial patch of rhubarb, and the garden and fruit trees.

DEMOLISHED A BRICK WALL.

An old brick wall built many years ago, about ten feet high, four feet thick and twenty feet long, was entirely demolished by placing a row of horizontal holes two feet from the ground, three feet apart and three feet deep. In each hole was loaded one-half cartridge of ammonia dynamite 30%, 1 1/4 inches by 8 inches, and six holes fired at one time by means of a blasting machine.

We Manufacture Levelers for Any Power From 6 Horses to a 75 H. P. Tractor

A Schmeiser Leveler

WILL WORK WONDERS ON YOUR FARM

Moving immense amounts of dirt daily, and working on ground too tough for horses and Frenos to tackle, SCHMEISER POWER LAND LEVELERS are now being used with utmost success by a great many ranchers, large and small—also by contractors—saving their owners' time, labor and money.

So extremely simple, a child could operate one, as a simple twist of the wrist raises and lowers the bucket or holds it stationary, as the case may require.

A GREAT ROAD MACHINE

Every road district should own one of these machines for constructing roads. They will cut down the high places and make fills quicker and cheaper than by any other known method.

YOU SHOULD

send for our latest catalog, J-600, which is full of interesting information on Labor Saving Devices and machines for moving the earth.

SIMPLE TRACTOR RECORDS.

"There is a great demand for facts as to tractor performances, both from owners and prospective owners," writes Harlow P. Roberts of the Emerson-Brantingham Implement Co., Agricultural Extension Department. "Experience has proved that the more days a tractor is used during the year the more profitable it is. Check up on your machine and see that it does its full duty."

How to check up on your machine is the question asked by many tractor users who are progressive enough to want to know their tractor costs. Mr. Roberts recommends use of a daily-weekly report blank, such as he is glad to furnish from his office in Rockford, Ill. This blank is on a pocket-sized card and a few minutes with a pencil each day will show how valuable the tractor is, whether it was worth as much this week as last, and how much it is costing. The writer can testify from experience the joy there is in having records such as this and the confidence he has in speaking accurately of the performance of his machine. The record also will sometimes indicate something wrong but undiscovered in the machine, as shown by excessive fuel or oil consumption. It will show with certainty how much basis there is for any impression that the tractor is costing too much for upkeep, and will tell tales on the careless or lazy operator. It is worth more in cash than many times the amount of time required to keep the record up to date. Copies of the cards may also be had from the Pacific Rural Press by enclosing postage for them.

STATE FAIR TRACTORS AND TRUCKS.

The biggest exhibit of tractors and tractor implements at the State Fair that has ever been staged has every likelihood to be put on this year, August 30 to September 6. Two rectangular tents, affording more space than was allotted to this feature last year, have been placed by Secretary Chas. Paine of the State Fair at the disposal of the California Tractor and Implement Association. The Association has voted to exhibit as a body. Practically every tractor and every farm implement suitable for use with a tractor will be on exhibit in comfortable tents. To avoid noise, dust and confusion, no machines will be run under their own power, but many of them will be run by electric motors.

Close by the tractor and implement exhibit, which will be located at the same part of the grounds as last year, will be the tent for motor trucks, of which more models than last year are expected. Restaurants this season will be placed close to the tractor and truck exhibit, and a catalog of all machines and their location in the mammoth tents is likely to be printed for convenience of visitors. Automobiles will probably be put in one of the buildings instead of the tent as heretofore.

SOUTHERN TRACTOR DEMONSTRATION.

The regular monthly meeting of the Tractor and Implement Dealers' Association of Southern California was held June 27 in Los Angeles. It has been decided that a monster tractor demonstration will be held in September, the dates to be announced later. It is expected that this demonstration will far eclipse anything yet attempted by the Southern California Association. The farming public will be notified as to dates and so forth in later issues of Pacific Rural Press.

POWER SPRAY GUNS.

Spray guns last season enabled two men to do the work that requires four men with ordinary rods and nozzles, and the two men spray many more trees in the same time, doing the work with equal thoroughness and with no more waste of spray if they observe carefully what they are doing. Even one spray gun on 3/4-inch hose will handle the full capacity of the biggest Bean triplex power sprayers, according to an official of that company. This sprayer has three 2 1/2 x 2 1/2 pump

Tractor Use, Profit, and Safety

TRUE progress is always slow. The change to mechanical power for farm work has been twelve years in the making, but today there are few American farmers who have not given serious thought to the question of tractorizing their farms.

For the benefit of those who may not yet be convinced that the tractor is a useful, profitable farm power machine, we present again a few of the opinions of farmers who are using the International Kerosene Tractor. Some of these are about essential features, and some mention only conveniences, but taking them altogether, almost any farmer will feel, after reading them, that the International 8-16 is a tractor worth considering.

"My international supplies a power flexible enough to handle the large amount of seedbed, harvest and other work without delay."

"It can be used for continuous work if emergency demands it."

"It produces power at much lower cost than horses, and it can be used for both drawbar and belt work."

"I like the steady way it works. Without seeming to hurry, it gets through a surprising amount of hard work."

"It does a lot of good work at a cost so low I could hardly believe it. You did a wonderful thing

for Eastern farmers when you made this tractor to run on kerosene."

"It is not bothered by flies, nor by bumble bees. It works steadily on the hottest days."

"Requires very little care. When the day's work is done, I run the tractor tail first into an inexpensive shed. In the morning, I fill the fuel tank and the oiler, look into the radiator, and am ready for another day's work."

These opinions are typical. They prove at least that the International 8-16 is a useful, profitable tractor. Now consider just one other thought for a minute.

This tractor is the outgrowth of twelve years of active tractor experience by a company that has sold all kinds of farm machines for many years. The beginning of this business goes back to 1831—almost 88 years ago. Does it not seem reasonable that with this experience we should offer you a tractor that you could use with profit, especially when we expect to come back some day and sell you more of the machines listed in this advertisement?

If you are now convinced that the International 8-16 is a useful, profitable tractor on some farms, and that you don't have to be an expert to buy one safely, write us to find out what this tractor will do for you, on your farm. A post card will bring you full information.

Best Ways of Banishing Bloat

(Written for Pacific Rural Press by E. H. Whitten.)

Many cows are lost every year from bloating. The trouble may be largely prevented by observing certain precautions, but in spite of everything some cases will occur. Therefore, every dairyman should acquaint himself with the symptoms of the disorder, understand the factors that cause it, and know how to treat a bloated animal.

When a cow is in normal condition the walls of the paunch have a constant motion, known as peristalsis, which is necessary for rumination (chewing the cud), for digestion, and for the progression of feed from one compartment of the stomach to another, and from the stomach to the intestines. There is always more or less gas formed in the paunch by the action of bacteria on the coarse parts of the food. Under ordinary conditions the cow belches the gas, and so bloating is prevented. But when large quantities of easily fermented green feed are taken into the paunch, there is a shock from the sudden change of food which tends to stop peristalsis. It causes a temporary paralysis of the paunch; there is an excessive fermentation of the feed; belching is prevented; the cow is unable to throw off the unusually large amount of gas, and bloat results.

Symptoms of Bloat.

The paunch of a cow, which is the storehouse for roughage, has a capacity of 45 gallons or more, and occupies a large part of the left side of the abdomen or flank. When the paunch becomes distended with gas it bulges outward and upward. Generally it rises above the level of the backbone, and when tapped with the knuckles it sounds hollow. Ordinarily, when it is distended only with feed, it does not rise higher than the backbone, and has a feeling like dough when pressed with the fingers.

When the paunch is greatly distended with gas it presses upon the diaphragm and interferes with the action of the lungs, thus causing distress in breathing. The cow is threatened with suffocation, and she breathes fast and hard, or perhaps gasps for air, throwing out her tongue and showing a darkened color of the mucous membranes, which normally are light pink. The cow stops eating and chewing her cud, appears anxious and haggard, her eyes are red, and saliva flows from her mouth. For a while she will stand, but after a time if she is not relieved she will go down, lie upon her right side, and quickly die.

Methods of Treatment.

If a cow is found bloated in an alfalfa field where there are checks, and the trouble is slight, drive her up to a levee and make her stand with her front feet on it and her head well up. For that matter, any place where she can stand with her front feet higher than her hind feet will answer. This will relieve the pressure on her lungs. After a time she will begin to belch, and will keep it up until the gas has escaped. A handful or two of baking soda put in her mouth will help matters along.

If the case has gone too far when discovered, and this method fails to bring up the gas, tie a stick, like a piece of pitchfork handle, well back in her mouth and fasten the ends with cords over her head, so that chewing or champing of the jaws will be started and the belching of gas will be encouraged. Better yet, use a piece of thick rope instead of a stick, smearing it with pine tar or axle grease. The chewing on the rope stimulates the secretion of saliva, and when the cow swallows the gas escapes up the gullet from the stomach.

Sometimes salt, pepper, or ammonia is used instead of soda—whatever is at hand, and whatever will tend to gag the cow and make her work her tongue. It frequently does good to dash cold water against the sides and body of the cow, and particularly over the loins; also to rub and knead the distended part.

Several other methods of treatment are used, either alone or in connection with a stick or rope gag. Those

that have given good results are: a tablespoon of formalin in a quart of water; two ounces of turpentine in a quart of warm milk, or a pint of raw linseed oil; one ounce of aromatic spirits of ammonia in a quart of water; one-half ounce of chloride of lime in a pint of tepid water; two ounces of hyposulphite of soda in a quart of water; an ounce of creolin in a quart of water. These doses are for adult animals; use correspondingly less for young ones. Administer as drenches, and repeat half-doses at intervals of one hour. Use a long-necked bottle, like a beer bottle, and be careful not to choke the animal.

It has been found that moving cows around and compelling them to exercise relieves them somewhat. Some dairymen run a rubber hose down the throat and into the paunch, and the gas is liberated through it.

Using the Trocar.

In an extreme case, where the cow is so far gone as to stagger and is almost ready to fall, it will be necessary to tap her with a trocar so as to allow the gas to escape. This instrument is made in two pieces, the trocar fitting inside the canula like a sword in a scabbard. The two, in position, are plunged through the skin into the paunch at the most distended point of the upper left flank, which will be about half-way between the last rib and the hip bone; the trocar is withdrawn, and the gas comes out through the canula.

Before using this instrument it should be disinfected or boiled for fifteen minutes. If there is time, paint the spot with iodine, and then, with a smart blow of the palm of the hand, drive the instrument inward, downward and forward its entire length. The gas will continue to escape through the canula for some time, and generally it is well to keep the canula in place by means of a cord passed around the body and tied to it. Any of the solutions previously mentioned can be injected through the canula directly into the paunch to stop fermentation and the further formation of gas.

In case of emergency, a knife and another sort of tube like a large quill, a spout to a coffee-pot, the top to an oil can, or a pea-shooter can be used. After you are sure that all gas has escaped, remove the instrument and disinfect the wound thoroughly. The chief reason so many object to the trocar is that they have seen bad results follow its use. The wounded part of the stomach wall became attached to the hide and the wound did not close properly, or the wound became infected and a diseased condition set in.

If a remedy is used which does not contain raw linseed oil, it is well to give a physic after the bloating subsides. Use a pound of epsom salts and one-half ounce of ginger in a quart or two of water and give as a drench to clear out the material which has been the source of the trouble. Withhold all feed for 12 to 24 hours.

Hints on Prevention.

There is no absolutely certain method of preventing bloat, but generally it can be avoided by careful management. Before turning the cows onto alfalfa or clover they should be given all the cured hay they will eat, or be allowed to fill up on a pasture of mixed grasses. Bloat usually results from cows being turned onto green, new pasture early in the morning, and after a period of being without food.

There is much less danger of bloat if the cows can be left on the alfalfa or clover continuously, as they then take their feed often and in small amounts instead of eating a large amount at one time. If they are driven back to the corral, do not let them drink water for a few hours. Give them free access to salt at all time—or better yet, a mixture of equal parts of slaked lime and salt. A safe way is to let the cows graze only about twenty minutes the first day, and increase the length of the period each day thereafter until the alfalfa or

clover seems to have lost its bloating effect. It is safer, also, not to turn the cows on the pasture until the dew or frost has gone. At first it will be necessary to turn them into the field two or three times a day, but the periods may be gradually lengthened and finally the cows may be allowed to graze at will without apparent inconvenience.

If there are two or more fields of alfalfa, cows not accustomed to it should follow those that have grazed the field down and have left nothing but coarse, woody stems and a small amount of green shoots. After being on such a pasture for awhile they may be graduated to another field with more green alfalfa.

Chronic bloating often is due to the presence of foreign bodies in the stomach or to a diseased condition there. Also it may be due to an obstruction of the gullet by pressure from glands enlarged by tuberculosis, and in every case of this kind the tuberculin test should be applied by a qualified veterinarian.

NOVEL SHEEP-DIPPING METHOD.

R. H. Brotherton of San Francisco, who has a ranch at Los Altos, is starting a very fine flock of registered Hampshires, but at present has not enough animals to justify a dipping vat, so he devised a dipping method which will prove interesting to others who have just a few sheep.

Mr. Brotherton mixed a small quantity of dip in an ordinary round galvanized tub holding about 25 gallons. He then made a little platform about 5 feet square and laid oilcloth on it. Then he got a ewe and tied her feet together—left hind foot to left fore foot and right hind foot to right fore foot—with two pieces of bale rope made into a loop, throwing a half-hitch over each foot. In this way the two sides were not held together. Then he took a large sponge and a bucket of dip and sopped the dip all over the ewe. The purpose of the oilcloth was to keep the waste from running off, and while one side of the ewe was being sopped all the dip which ran down was caught in the wrinkles of the oil cloth and soaked the other side. After one side was completely saturated Mr. Brotherton turned the ewe over and completed the saturation of the other side, including neck, brisket and under body. It takes only about 5 minutes to completely saturate a sheep with dip.

Mr. Brotherton was very much pleased with the results. He repeated the process in 10 days and later on an examination proved that every tick had been killed. Only the mature animals were treated in this way. The young lambs were dipped bodily in the tub.

DAIRY COUNCIL'S ATTRACTIVE PROGRAM.

After several months of quiet organization work the California Dairy Council is ready to show the public what a big thing it has really undertaken, and in connection with the coming annual meeting a program for the public has been arranged.

On Tuesday, July 8, at 2 and 7:30 p. m., general conferences will be held in the Assembly Room of the California Development Board, Ferry Building, San Francisco, and the general public will find it well worth while to attend. Every phase of the dairy industry will receive attention, and prominent men will speak. These include Dean Thos. F. Hunt and Vice-Director H. E. Van Norman of the College of Agriculture; Dr. Wm. C. Hassler, San Francisco Health Officer; Wm. T. Boyce, U. S. Department of Labor; Hon. Frank J. Cummings; Senator E. S. Rigdon; Geo. F. Eberhard and others.

There will be executive sessions at 10 and 2 o'clock on Wednesday, and a permanent board of directors will be elected. This matter is so important, and such a strong program has been arranged, that every member of the Council should lay aside other duties and attend.

A filthy hog trough is a seedbed of disease, and, next to hog cholera, it is the nearest enemy to the swine industry. Get a sanitary trough of some kind and keep it clean.

PORK PRODUCERS' CONTEST—A NEW STUNT.

The breeders of Kings county seem to always be thinking of some new, practical way of keeping that section prominently before the public as a livestock center, and the latest wrinkle is a pork-producers' contest. It will be held October 15 at Hanford, and will be open to all breeds of hogs—purebreds or grades—provided they were raised within the county.

In order to make this novel contest a success and have enough competition so that the prizes will really be earned, at least 5 of the 11 Farm Bureau centers in the county must be represented, and there must be at least 5 contestants from each center. Eight centers have already entered a total of 800 hogs, so the success of the contest is assured.

The details have not yet been worked out, but enough money has been pledged for prizes, and the full program will be given later. There will be classes for fat hogs from carlots down to individuals. A roast pork luncheon will be served to keep up the record of Kings county breeders for hospitality.

UNEEDA GLENN COUNTY HERD OF DUROCS.

(Written for Pacific Rural Press by Thos. F. McConnell.)

If you fancy Duroc-Jersey hogs and are looking for good ones, you will find that H. P. Slocum & Sons have rightly named their herd. At their ranch, 7 miles northwest of Willows, we found suckling pigs, weanlings, open and bred gilts, tried sows and boars of all ages—but all of one quality, and that strictly first-class.

Clayton Slocum, the junior member of the firm, made the right start to become a successful swine breeder by taking a course in one of the eastern agricultural colleges and then became herdsman in some of the great herds of his favorite breed in the Middle West. He finally launched out, with his father as senior partner, in the breeding, showing, buying and selling of Durocs here in California.

There is not a single animal for sale or used for breeding in this herd that is not a true representative of the breed. Model Col., two years old, is one of the best. Uneeda Model Queen farrowed 11 pigs this spring and looks just about right. A 4-year-old sow, sired by Crimson Wonder Again, is a great brood sow. Experimental Defender, sired by Defender, is a 5-year-old boar from the McKee herd of Kentucky that was brought out here to use in this herd. He stands fine on his feet and has great quality. Uneeda Wonder, a great boar that has been fitted for show three times and used in the herd each year, shows wonderful quality and constitution. Then there are five September boars by Uneeda Kings Col. that are as even as peas in a pod. They are the big, strong, growthy kind that Duroc breeders are looking for at present.

This firm furnished 90 per cent of the foundation stock for the settlers at the Durham State Land Settlement, which speaks for itself as to the quality of hogs bred and sold by the Slocums.

WITTE Engines

2 to 30 H. P.

Built Better—Cost less to operate and to own—Easy to understand—Few working parts—Strongly built—Every part guaranteed against defect during the life of the engine. Built from standardized metal patterns. Every part interchangeable and easily replaced by operator. Ask us for prices on all sizes. Stationary, Portable or Saw-Rig Outfits.

A. H. SIMPSON CO.

129 FREMONT ST.
SAN FRANCISCO, CAL.

Record-Breaking at Palo Alto

(Written for Pacific Rural Press.)

Some one has said that the way to succeed is to start with the best obtainable and then strive constantly to improve it. That seems to have been the policy at Palo Alto Stock Farm. When official testing began, the president, M. H. Tichenor, decided to give the cows the best opportunity in the world by getting the best man obtainable to feed and milk them. So back in Wisconsin he found a man who had achieved phenomenal success and had given world's records to several cows. He was hired, and did most creditable work with the Palo Alto herd.

But one day when they were about to start on test a cow who gave promise of being a world beater, this herdsman came to Mr. Tichenor and said that he thought a young chap named James Armo had better milk the cow, as he could get more milk out of a cow than any other man on the place, not even excepting the expert herdsman. Mr. Tichenor could not believe the statement at first, but the records in black and white showed that he led the herdsman by from 4 to 6 pounds at a milking.

So this young chap was given the important task of milking the most promising cows on test, and he deserves a big share of the credit for the many excellent records that have been made. That Mr. Tichenor realizes this is proved by the fact that he has worked Mr. Armo upward from a position paying \$20 per month and board to superintendent of dairy cattle at ——. Well, we don't know what he gets now, but we do know that he is mighty well

SAN LUIS OBISPO LIVESTOCK SHOW.

High-class livestock of all kinds, from goats to draft horses, completely filled the barns and pens at the San Luis Obispo Livestock Show, June 27, largely due to the untiring efforts of the "sure nuff" livewire secretary, Warren C. Day, and to Prof. R. W. Ryder of the State Polytechnic School.

The Pecho Ranch and Stock Company, owned by A. B. Spooner & Sons, had the largest showing of registered Holsteins, although H. M. Warden was a close second. Both herds were good ones and had individuals that would show well in any company. Many high-grade dairy cattle also were shown.

S. J. Lowe had a large exhibit of Shorthorns of excellent type and largely of Scotch breeding. Geo. H. Andrews had a Jersey bull and a heifer and Warren C. Day a heifer that everyone admired. Sinsheimer Bros., E. H. Meinecke and J. W. McLean also showed good ones.

Pecho Ranch and Stock Company and S. J. Low had large exhibits of Poland-Chinas; F. L. Sandercock and Sinsheimer Bros. were there with Durocs; White Triangle Ranch showed Durocs, and a Clydesdale stallion that was a corker.

Members of the Boys' Pig Club of the Polytechnic School had their pigs on exhibition and made a very good showing.

In addition to the livestock there was an exhibit of tractors, trucks and machinery that would have been a credit to a much larger show.

ALFALFA GROWERS' OAKLAND OFFICE.

Owing to great growth of business of the Alfalfa Growers of California, Inc., in this part of the State; they have opened an office in Oakland complete in every detail to handle accounts as promptly as they would be handled at the head office in Los Angeles. It is located at 325 13th street, close to the Association's deep-water and spur-track warehouse. F. A. Frazier will be in personal charge and W. A. Stoddard will continue in charge of sales.

Gas tractor short course, University Farm, September 16 to 25. Absorb it.

satisfied, for only a few weeks ago the farm was visited by an eastern millionaire who owns one of the finest herds of Holsteins in America, and after watching Mr. Armo's work he told him that no matter how much he was getting he would pay him twice as much to go back east and work for him. What Mr. Armo said in reply would not look well in print, but we don't believe he omitted any cuss words in the English language, and he certainly convinced the visitor that he was getting more out of his job than the mere money in his pay envelope.

Two good lessons here for farmers employing help. One is that it pays to keep an eye open for ability; the other is that it pays to treat a man right after you find out that you have a diamond in the rough. Don't let someone else get him away from you. Make him so well satisfied with his pay, his living conditions and the consideration you show him, that he can no more be induced to change his position than a leopard can be made to change its spots.

BERKSHIRES INVADE MONTEREY COUNTY.

The bucking bronchos proved no better drawing card than did the beautiful Berkshires at the Rodeo at Salinas last Saturday, when the Western Berkshire Congress held another promotion sale. There was a large attendance, and although the Salinas section has not been noted as a hog-raising community, the people seemed to be out after good blood; they found it, and they bid liberally.

The Berkshire breeders have experienced such a heavy demand for bred gilts that they are about sold out, and over 75 per cent of the animals offered at this sale were spring pigs, yet the average on 31 head was \$40.55. This was considered satisfactory by the consignors, as it meant the starting of several new herds and the placing of better blood in herds already established.

The sponsors of these promotion sales deserve great credit for the excellent work they are doing. They not only consign stock which would bring 50 per cent better prices at regular sales, but pay their own expenses to the sales that they may help educate the people of the different communities to the advantages of

purebred hogs in general, and Berkshires in particular.

Col. Ord L. Leachman, who cries these sales, keeps interest at fever heat, and deserves a good share of the credit for their success.

SAN FRANCISCO TO GIVE LIVESTOCK SHOW.

President W. T. Sesnon states that the \$50,000 guarantee fund for the San Francisco Livestock Show has been raised; also a splendid location in the city has been secured. Prof. G. H. True is expected home this week from Honolulu, to assume at once the management of the show and will issue classification and premium lists shortly. San Francisco will put on a big show the first week in November and the breeders of purebred stock of the Coast expect to put their best stock in competition at that event.

The good feeder knows that feeding of a young animal scantily produces that which it is all but impossible to overcome by liberal feeding later on. The digestive and assimilating organs accustom themselves to conditions, and will not readily respond to new or changed proportions.

For your Hogs Calco Troughs

CALCO HOG TROUGHS are strong, sanitary and durable. They help you to raise healthy hogs. Calco Troughs are built of Armeo (guaranteed) Galvanized Iron and Cast Iron.

There are no seams or crevices in Calco Troughs to catch disease germs. Substantial cross-bars and rolled edges give exceptional protection against pressure to trough sides from feeding animals. All rough edges are eliminated. Calco Troughs are easily cleaned, easy to anchor down—ideal for water or feed for your hogs.

Note These Sizes and Prices

Stock	Diameter	Depth	Length	Weight	Price
720	10 1/4 in.	5 5-16 in.	24 in.	16 lb.	\$2.95
721	10 1/4 in.	5 5-16 in.	30 in.	19 lb.	3.30
722	10 1/4 in.	5 5-16 in.	40 in.	22 lb.	3.70
723	10 1/4 in.	5 5-16 in.	60 in.	27 lb.	4.50
724	10 1/4 in.	5 5-16 in.	120 in.	45 lb.	6.95
715	14 in.	7 3-16 in.	24 in.	25 lb.	4.55
716	14 in.	7 3-16 in.	30 in.	29 lb.	5.00
717	14 in.	7 3-16 in.	40 in.	32 lb.	5.60
718	14 in.	7 3-16 in.	60 in.	39 lb.	6.55
719	14 in.	7 3-16 in.	120 in.	61 lb.	9.60

Rubbing Elbows with Other Breeders

(Written for Pacific Rural Press by Thos. F. McConnell.)

System Brings Success at Gibson's.

A short time ago I saw a full page Burroughs Adding Machine advertisement in a business magazine, and it was devoted entirely to the methods employed at the ranch of J. S. Gibson Company, Williams. Of course the ad played up the Burroughs machine, showing how it enables farmers to watch their relative costs and profits from any crop or class of livestock, but to me it explained the reason for the success of this company. The successful farmer nowadays must be a good business man, and good business methods certainly have brought success to the Gibson Company.

This firm is constantly striving to improve, and on my recent visit to the ranch I was interested in an experiment with Sudan grass for pasture on irrigated ground that if successful will be of great value, as it will afford green pasture during the dry season. This experiment should be watched with interest by many California Dairymen.

The Holsteins certainly looked fine. The herd consists of 180 head of registered animals and the herd sire is Prince Alcartra Korndyke, son of the world record cow, Tilly Alcartra. Nearly all of the cows carry Tilly Alcartra blood. Two daughters of Tilly are on yearly test now. One has produced 31.39 pounds butter and the other 30.50 pounds in 7 days.

Shortage of labor is being experienced here as elsewhere, but milking machines are used and they help to solve the problem. The stock looks fine and everything seems to be progressing in excellent shape.

Glide Has the Goods.

It is a pleasure to visit Hillcrest Stock Farm at Davis, owned by T. S. Glide, and to make the rounds among the Shorthorns. Wm. Robertson, the herdsman, took the blankets off the good ones and he surely has them coming in fine shape.

The senior yearling heifer by Count Amaranth is of the low-down, blocky type, with head set squarely on shoulders, and is hard to beat, although the junior yearling heifer by Village Type, standing next to her, is of the type that some might prefer. They are two that are not forgotten easily. Then the junior 2-year-old heifer, Little Sweetheart, by Golden Goods Junior, makes one think of the pictures drawn by artists when they try to outline perfect Shorthorns, only in this case the reality beats the picture. With an almost perfect front, an excellent head, a correct top line and a broad and thickly covered back, this heifer will be hard to beat.

The senior yearling bull, Hillcrest Amaranth, a red roan, is a growthy fellow that has excellent lines. With a little more flesh he will be in good show shape.

The passing of King Lancaster, the noted senior herd sire, is much to be regretted, although this great bull was 13 years old when he died. He was not only a great sire but the greatest show bull on the coast, as he was the only Shorthorn bull that was made grand champion three times at the

State Fair. To the best of Mr. Glide's knowledge this bull was never outside of the blue in his long show career. Mr. Glide has several heifers and cows in calf to King Lancaster. May their offspring be like him.

Witherow's Classy Durocs.

H. P. Witherow, who has been breeding Durocs for several years in Shasta county, moved his herd several months ago to the Greenwood Farm at Live Oak, where he certainly is establishing a great herd. He aims to increase the size of the herd as rapidly as possible without sacrificing to mere numbers the high standard already attained.

The foundation stock is composed largely of the 5-year-old sow, Col. B's Queen 4th, and herd descendants. Competitors will have to travel far and pay long prices before they get her equal. The sow is an example of prepotency in breeding, as most of her known descendants carry the much-wished-for conformation and prolificacy. This sow was obtained from the University Farm at Davis and is certainly a valuable animal.

The young 15-months-old herd sire, Johnson's Defender, Jr., is a fit sire for such a herd. He has large bone, plenty of height and stretch, with a very strong back and worlds of quality. Fred Devore visited the herd on his recent trip to the Coast and was loud in his praise of the boar. He said that he was a great individual in every way and that Mr. Witherow had one of a very few herds in California that did not need a new boar. As an individual there is no question as to the merits of this youngster, and his blood lines are strong enough to guarantee his breeding qualities.

Sandercock Swears by Berkshires.

W. F. Sandercock of Sacramento and San Francisco believes that his Natomas land is the best in the world, and he is proceeding to demonstrate that the best Berkshires in the world can be raised on it. To do this he must have individuality, and then breeding, so that the individuality will be transmitted. Therefore, he has at the head of his herd the national grand champion, Baron Duke 201st. While this boar is 6 years old he is strong and vigorous, stands well on his feet, still has a well-arched back and is very active, proving that he is still a great herd header. This fact was clearly demonstrated when we looked at one of his litters out of Princess Leader. The pigs were very uniform, with great length and strong backs, and promise to develop into prize-winners. There is one boar in the lot that looks good enough to win anywhere.

The junior herd sire, Rincon's Rival by Ames Rival 102nd, is perhaps even better than the senior sire; in fact, he has a more stylish head and is fully as good in the back, although it is hard to make a true comparison on account of the difference in their ages.

On the female side of the herd particular mention should be made of Symboleer Belle, a 7-year-old sow that has always given a good account of herself as a mother. She has had as high as 17 pigs in one litter and has never farrowed less than 7. As an individual, Rookwood Belle, by Rival's Champion's Best, is a wonderful specimen, having extreme length and a strong, well-arched back. Three gilts out of Rookwood Belle by Baron Duke surely help Mr. Sandercock to prove his claims regarding the Natomas district as a great swine-raising locality.

Success in swine raising depends largely on close supervision, and while Mr. Sandercock is a very busy man, he spends every week end at the ranch looking over the hogs and noting how each one is coming along.

At the recent annual meeting of the American Jersey Cattle Club an appropriation was made to cover the expenses of the proposed economy test which is the outcome of a challenge by Ed C. Lasater, owner of the Falfurrias Jersey Ranch, Texas, with its 5,000 Jerseys, to the Holstein breeders of Texas to hold a year's test of the two breeds to determine which can produce all dairy products most economically.

BRED DUROC-JERSEY SOWS and GILTS at Public Auction

Wednesday, July 16, 1919

All selected from the herds of the leading breeders of Tulare County. All bred to high-class boars for early fall farrow. The blood of such famous DUROCS as Defender, Critics, Golden Models, Crimson Wonder and Orion Cherry King predominates in the animals offered in this sale.

REMEMBER every animal will be sold to the highest bidder without reserve.

HERE'S YOUR OPPORTUNITY to secure show animals, foundation herds, or better animals for pork production.

THE TULARE DUROC-JERSEY BREEDERS believe they are offering animals of superior merit, individuality and breeding, worthy a place in any herd, and animals that will be a profitable investment for the purchaser.

Write to R. C. Sturgeon, Secretary, Tulare, and secure a copy of the sale catalog. It will give you the breeding of every animal in the sale and assist you in making your selections.

MARK CAREFULLY the day and date—**WEDNESDAY, JULY 16, 1919**, and be our guests while attending the greatest sale of Duroc-Jerseys ever held in California.

Free Lunch at Noon.

Sale Starts promptly at 10 A. M.

Ask These Pigs How to Feed

—Courtesy Iowa Experiment Station.

They will tell you, "Put us on alfalfa or other green pasture; give us free access to a self-feeder, and let us eat all we will." Ask why, and here is their story:

BIG PIG—"Look at my litter mate. Gosh, ain't she a little mate? When they separated us she was given a 1 per cent grain ration, and it wasn't enough to keep the squeal down. At almost six months, after 120 days of feeding, she weighed only 136 pounds—hardly enough for profit. She ate an awful lot of alfalfa, but didn't have enough grain to go with it to make her grow fast."

LITTLE PIG—"Gee, my brother's lucky. They put him in another alfalfa field, but instead of giving him a starvation ration of grain they put him on a self-feeder. That's what I call a regular pig Heaven, and it's why my brother weighs 235 pounds to my 136. You wouldn't think that we came from the same litter and that I was just as big as brother at weaning time, would you? Oh, well, I've got one consolation, and that is I'll be here on the farm two or three months after my brother goes to market. But it's pretty tough on my master's pocketbook, ain't it?"

SLOP-PAIL SUGGESTIONS.

The most desirable market weights are from 175 to 225 pounds, and at these weights the greatest profit can be made when grain is high. Good hogs should be ready for market at these weights when six to eight months old.

Expensive pork comes from fattening hogs on grain alone. Tankage is high in price, but necessary for producing low-priced pork when no skim-milk is available.

Alfalfa pasture saves from 15 to 20 per cent of the grain for fattening hogs, but used without grain it is little better than a maintenance ration and will not make profitable pork.

Barley, milo, kafir and other small grains should be ground or rolled. Soaking serves about the same purpose with barley, but is not so good with the sorghum grains.

It doesn't pay to cook feed for hogs. In many cases the feeds are made less valuable. Potatoes and beans, however, are improved by cooking.

Two good feeds mixed together are better than double either one of them singly. Hogs crave variety.

Fresh slops are usually safer than those which have stood for some time, especially in warm weather.

In winter feed alfalfa hay in racks. Don't force the hogs to eat the coarse stems. Feed them to the cattle and sheep. Nothing will then be wasted, and the hogs will thrive much better

on the leaves and fine stems.

Or you can use alfalfa meal instead of the hay. But don't force the hogs to eat too much of it. It is bulky and hard to digest. One-fifth to one-third of the ration is about right.

Three pounds of skim-milk to one of grain, is the rule. Whey is worth about half as much as skim-milk. Buttermilk not diluted is equal to skim-milk. Sour milk gives the same results as sweet skim milk, but it should be fed continually and not alternated with sweet skim-milk.

Salt should be available at all times. Mixing it with charcoal and other minerals in the form of a tonic is a good plan.

Remember, good feeding is the secret of success. No matter what the blood lines or the individuality of the pigs, if a man is a poor feeder he will never make a successful breeder.

Elmer Lamb of Ceres has a gilt purchased from Donald Graham that farrowed 8 pigs which weighed 28 pounds when born and gained one-half pound each per day for the first four days. Donald says this is the way Orion's King Gano pigs grow.

September 17-20—Antelope Valley Fair, Lancaster.
September 22-27—Kings County Fair, Hanford.
September 22-27—Glenn County Fair, Orland.
September 30-October 4—Fresno County Fair, Fresno.
October 6-11—Tulare Livestock Show, Tulare.
October 7-11—Southern California Fair, Riverside.
October 13-18—Tulare County Fair, Visalia.
October 18-20—Los Angeles Livestock Show.
November 1-8—San Francisco Livestock Show.

The Dairy.

E. E. Freeman has been awarded \$70 prize money by the Holstein-Friesian Association of America for the production records of cows in his herd.

J. W. Benoit of Modesto has a wonderfully fine lot of heifers sired by his herd bull, Lone Oak Trezol Korndyke, who is a son of a 32-pound cow.

A. M. Bibens of Modesto is bringing out from the east a bull calf whose two nearest dams averaged 39 pounds. He is a grandson of Ormsby Jane Segis Aaggie, the only cow that has twice made a 40-pound record.

T. J. Gist & Sons of Holberk Stock Farm, Tulare, have had two Holstein cows make very good records. Astrologess Bonnie Maid produced 20.60 pounds butter in 7 days, and Morland Contenta Jetz 20.15 pounds as a 3-year-old.

C. L. Weaver of Tulare has lost his senior Milking Shorthorn herd sire Solano Royal, but has an excellent successor in North Star by Bransby's Coming Star. He has 22 very fine matrons and expects to show this fall.

At the first annual guaranty sale of Minnesota Holstein breeders held at Moorland, Minn., June 12, 76 head averaged \$2,890 which beats the best previous record by \$460. The bull Sir Pieterje Ormsby 41st was purchased by Gustav Pabst and E. C. Schroeder for \$65,000. Five head sold for \$10,000 or more and only 22 head sold for less than \$1,000.

Beef Cattle.

At the Shorthorn sale of Bellows Bros., Maryville, Mo., June 19, 73 head averaged \$2,180. The bull Standard Supreme sold for \$15,600.

Conejo Ranch, Newbury Park, have sold off all of their grade beef cattle and have recently received a carload of pure-bred Herefords from the east. The cattle will be shown at the leading fairs this fall.

An interesting meeting of the members of zone 3 of the California Cattlemen's Association was held at Salinas last week and addresses were given by Howard Jack, H. O. Jastro, L. A. Nares, Senator E. S. Rigdon, Arthur Hebborn and J. L. Matthews, president of the Monterey Association. The workings of the hide and brand law were discussed and recommendations were made for changing the in-

spectors. Mr. Jastro emphasized the danger of overstocking ranges.

Swine and Swinememen.

Carstons & Halloway of Madera have a mighty good herd sire in Madera Sampson by Fresno Sampson.

Harry A. Condee of Hesperia, San Bernardino county, is starting a registered Duroc-Jersey herd with very choice stock.

A. J. Elliott of Willows Ranch, Tulare, has recently purchased a half interest in H. C. Shinn's great new boar Orange Boy.

The Western Berkshire Congress will hold a donation sale at the State Fair to raise funds with which to carry on promotion work.

Sturgeon Stock Farm, Tulare, will consign to the Duroc-Jersey bred sow sale at Tulare July 16, 10 topnotch gilts bred to Golden Col., the great son of Critic B.

Geo. L. Horine of Winton continues to sell Durocs like hot cakes. Last week his sales totaled \$360 and he says that the Rural Press brings 90 per cent of his business.

The members of the Lemoore High School Pig Club presented Wm. Bernstein of Hanford with a beautiful gold pencil as a slight recognition of his aid in their recent very successful auction sale of pigs fed by them.

P. E. Mitchell of Atwater has a 9-months-old Poland-China gilt sired by Kings Big Bone Leader and out of a President sow that is the equal of many brought out from the East at long prices—perhaps just a little better.

Conejo Ranch, Newbury Park, have sold 7 sows to W. H. Dupee, Santee, and 10 to A. S. Smith, a ranch owner in the San Joaquin Valley. They will show both Durocs and Hampshires at the leading fairs this fall.

T. J. Gist & Sons of Holberk Stock Farm, Tulare, are establishing a herd of registered Durocs. They have recently purchased two fine sows from H. E. Cornwell and five gilts from J. P. Daggs. They now have ten registered females in all.

Frank B. Anderson, the Berkshire breeder of Sacramento, has engaged Jack Findlay to take charge of his herd. Findlay will be remembered as the former swine herdsman at the University Farm and is one of the best men in his line in the west.

Sherwood Beckman, the live wire secretary of the newly formed San Joaquin County Poland-China Breeders' Association, reports that the breeders of Lodi district will hold a sale in the near future to consist of only the tops of the different herds. The date will be set at the next meeting of the association.

Hampshire breeders of the state are urged to meet at Santa Barbara August 6 at 10 a. m. when it is planned to organize a California Hampshire Breeders' Association. The secretary of the national association, E. C. Stone, will be present at the time, which is the same day that the Underhill Hampshire sale will occur.

E. B. and H. Potier are establishing a big-type Poland-China herd on their 50-acre fruit and walnut ranch at Santa Barbara, known as the Glen Helen Ranch. They purchased their foundation stock from Renwick Ranch and say that before long they expect to have the big hog men of the state turning that way for stock.

Walter C. Ficklin, Poland-China breeder of Fresno, whose ranch is at Madera, has a gilt, Choice Queen, by My Choice and out of Wonder Kings, that is about as good as will be found anywhere. She was purchased at the Bernstein sale. Also at the Bernstein pig sale Mr. Ficklin bought a boar pig that promises to develop into a hummer.

Johnnie Glusing of the Winton Poland-China Farm at Winton has sold two pigs from the litter of 14

out of Big Model Lady, the top sow at the Gatewood sale, one going to Chas. Gatewood, Fresno, and the other to L. G. Megerle, Clements. Mr. Glusing will sell a few more from the litter, but is reserving a boar and a gilt to show at the State Fair.

Hale I. Marsh of Modesto and Les McCracken of Ripon announce a sale of big type Poland-Chinas at Modesto, October 4. The offering will be made of all tried sows and gilts—all bred—and the animals will represent the best blood lines of the breed. The sows and gilts offered by Mr. McCracken will be bred to Kings Big Bone Leader, the State Fair grand champion of 1918.

D. H. Forney, the Poland-China breeder of Fresno, has a new herd sire, Hather's Giant Bob. He weighed 460 pounds at 11 months and is a smooth, upstanding boar of the most fashionable type. There are some excellent fall gilts in Mr. Forney's herd sired by California Jumbo Buster and Oleander Boy. Six of these will be bred to Hather's Giant Bob and consigned to the Fresno County Poland-China Breeders' sale.

R. K. Walker of Winsor Ranch, Bonita, writes that the great sow, Model Defender Lady, whose picture appeared in our swine issue last February, measures 72 inches from between eyes to root of tail, 75 inches in heart girth, 74½ inches in loin, and stands 38½ inches high. She is a little over three years old and has had four litters of pigs with no litter less than eleven. She weighed 800 pounds last November.

Sheep.

John E. Marble of South Pasadena, whose ranch is at Redlands, has recently sold a Dorset ram lamb to the University of Nevada and one to Adams and Nye, Karlo, Nevada.

M. P. Harris of Holtville raised 60 orphan lambs on 3 cows during the past season. Morning and night these lambs were bottle-fed a mixture of calf meal and water and half cow's milk made into a gruel. This was kept up until they were from six to nine weeks of age, and the lambs certainly did well.

A Government report states that before the war the United States had approximately one-tenth of all the sheep in the world, but since then the total number has decreased about one-tenth, which makes the decline in excess of 50,000,000 sheep.

Wilson E. Elliott of Lake View Farm, Loleta, reports that his lambs this year are the finest he ever raised. He recently weighed two and they tipped the beam at 94 and 100 lbs. Mr. Elliott makes a specialty of hardy, northern grown rams "wooled from nose to toes."

Milo D. Campbell, a member of the National Agricultural Advisory Committee, has made public charges that wool growers and the Government have been defrauded of millions of dollars through methods employed in handling the 1918 wool crop. Specific charges against the big wool dealers are that they were to advise the War Industries Board how to do the work, were made Government agents and helped fix the prices which the Government would pay. They then bought from farmers "in the grease" at from 65c to 67c and sold to the Government as "scoured wool" at \$1.30 to \$1.85, but not a single pound of wool was actually scoured, according to Mr. Campbell.

Livestock Miscellaneous.

The Kings County Fair will be held September 22-27 on greatly improved grounds. Twenty acres of additional land have been purchased

Registered Duroc Jersey Boar

"River Bend High Model," No. 180985
 Farrowed February 17, 1915.
 Sired by "High Model," \$3,000 boar, who was six times Grand Champion in the Middle Western States.
 MR. HANS HANSEN, OAKVILLE, CAL.

REGISTERED HOLSTEINS

Creamcup Herd offers service bulls and bull calves of 34-lb. breeding. Females offered for foundation stock. Tuberculin tested.
 M. M. Holdridge, San Jose, Cal.
 R. D. "A," Box 437.
 Two miles out North First Street.

Pork Production

BY ACTUAL TEST PURE HAWAIIAN CANE

MOLASSES

will increase pork production approximately five-tenths pounds daily over a barley and tankage feed, yet it sells for less than half the price. Do you know of any other feed at any price that will do this?

Why not get all the profits out of your hogs?

Write us immediately for a copy of above test.

W. H. YOUNG COMPANY

58 SUTTER STREET,

SAN FRANCISCO

SAN RAMON SHROPSHIRE

The flock includes selections from the best blood of England and America. It has won at all the leading Pacific Coast shows.

Won at the Panama Pacific International Exposition 15 firsts, 9 seconds and 6 championships, including grand champion ram.

Won at the Chicago International, first pen of 5 yearling rams, first ram lamb, second aged ram, fourth, fifth and sixth yearling ram. Second get of sire, fourth pen of 3 ewes, fourth flock.

We have a few choice registered and range rams left for this season.

Write or Call and See Them.

BISHOP BROS.

FRANK RUTHERFORD, SAN RAMON, Contra Costa Co., Cal.
 Manager

GRAND CHAMPION RAM P. P. I. E. 1915

and old buildings are being remodelled and new ones built. Hog barns, poultry houses and restaurants are being remodelled and an 80-foot, one-mile race track is being built.

Stockmen will have an opportunity to learn the main principles and practices of feeding all kinds of stock in the Farmers' Short Course to be held at the University Farm, Davis, during September and the late fall months. Such a course will prove of special value to farmers and dairymen now, when with the present high feed prices, more than half of the cost of operating a dairy is charged to the item of feed.

Growing hogs, as well as humans, thrive best amid clean and sanitary surroundings. Yet too many hog lots are extremely filthy. Who has not seen hogs in process of fattening obliged to eat their feed standing in mire almost to their knees?

Guilford, owners. Special Notice: Second Farm Sale. Shorthorns; Shropshires; Berkshires; Ponies. August 2, 1919.

More Light on the Marketing Problem

(Written for Pacific Rural Press by E. E. Nicolls, San Francisco.)

Mr. Nicolls has long been identified with the U. S. Bureau of Markets, and during the last year has had charge of the livestock department at San Francisco. He writes this article as an interested individual, not a Government official, but his intimate knowledge of first-hand conditions enables him to treat some phases of the subject from a new angle.

The first requisite to a serious consideration of the subject of marketing cattle is accurate data regarding both the actual and potential supply, the grade of animals ready to market, the market price of the various grades, the requirements of the market as to weights and quality, the movements of livestock, the annual consumption of past years and information as to whether the demand is steady or seasonable.

By the actual supply is meant the cattle that are ready for market at the present time or will be in the next few months, and by potential supply those that are being prepared for next year and the year following. The only data available is that issued by the U. S. Bureau of Crop Estimates, which state that on January 1, 1919, there were in California 1,650,000 cattle, other than milk cows, valued at \$79,530,000. These figures were arrived at by taking the census of 1919 as a basis and estimating the percentage of increase or decrease year by year until the close of 1918. This estimate is most unsatisfactory, owing to the difficulty of getting reports from the growers. It is impractical for this Bureau or any other organization to take an annual cattle census. If the cattlemen of the State would interest themselves sufficiently to co-operate closely with the Bureau of Crop Estimates, it would be possible for them to receive, at no expense and very little trouble, information which would be wonderfully accurate and of great value. As it is now, we have simply an estimate of the number of cattle in the State. No one knows even approximately how many are to be marketed this summer, how many will be ready next fall, how many will be in feed lots next winter, or how many will probably be offered in 1920 or 1921. No one knows the proportions of steers, cows and grass cattle that will be marketed. Yet such information is fundamental.

The information available as to market movements is a little more comprehensive. The Bureau of Markets issues a daily report showing the movements of cars of each species of livestock loaded in the United States each day, and the destination to which they are consigned. It gives the daily receipts at the great centralized markets and an estimate of the number that will probably be received on the following day, together with comparison of receipts of the same day a week ago, a month ago and a year ago. This gives the shipper a little idea as to the immediate supply available at each of the markets and enables him to form an opinion as to which will probably be the best market to ship his stock.

The information regarding livestock prices is quite complete and accurate for some parts of the United States. For a number of months it has been possible for California livestock men to receive reports every day without charge, giving definite information as to what the various grades of cattle, sheep and swine were bringing on the Chicago, Kansas City and Omaha markets. In addition to this, during the heavy movement of sheep and cattle from California to Eastern markets, the local office issued information regarding the weights and prices received for California livestock each day when any sales were made.

No Livestock Market Here.

There have been numerous requests that the Bureau issue this same information for San Francisco, but this is impossible because there is no livestock market here. Not only has the Bureau of Markets been criticized for not issuing this information, but the publications issuing livestock price quotations have been even more severely criticized on the ground that the information is not correct. One reason given is that the press is controlled by various packing interests,

but I do not believe that the publications issued in San Francisco would be susceptible to such influence, even if they were given the opportunity. The reason the prices given are not accurate is because it is impossible to quote a livestock market in San Francisco which really means anything is that there is no system of standards and grades recognized on this market. The good cattle in California have carried the poor cattle to market for years, and this makes it impossible to state what the price is for any given grade of cattle.

Since the office of the Bureau of Markets was established in San Francisco quotations have been made public, showing actual prices received for various grades of dressed meats each day. Inconceivable as it may seem, a number of livestock men have stated that they are not interested in the prices received for dressed meats. They seem to think that as soon as they have sold their cattle to a buyer their stock is marketed, but it has merely changed ownership. It is not marketed until the products derived therefrom have reached the ultimate consumer. (The stock grower should be vitally interested in the prices received, not only for dressed beef, but for the by-products as well, for these are the prices that make the market for live cattle. All of which goes to show that the interests of the packer and stock grower and the retailer are identical rather than antagonistic. While one branch of the industry may temporarily prosper at the expense of the other, it cannot do so permanently. Accurate information regarding the selling prices of dressed meats is essential.)

There is very little available information regarding the seasonable demand for cattle. Stock growers should know how much beef is consumed in San Francisco and the State each month of the year, as this would enable them to equalize their marketing to a certain extent at least. The Bureau of Markets began compiling such records for San Francisco shortly after the office was established and has them for the past five or six months. After these records have been completed for a year they will begin to be valuable to the producer and will be available to him at any time, providing Congress sees fit to provide sufficient funds to continue the work.

It may seem to a great many people that this matter of gathering information is a very simple affair, and that it should be conducted quite easily and inexpensively by a local organization of cattlemen or some other organization, but so far the Department of Agriculture, which employs thousands of trained men, has not succeeded to any marked extent. The gathering of this essential information is a mighty big job and can only be conducted by an organization that is not only entirely unprejudiced but also supported by the highest law of the land.

Benefit of Stockyards.

Whether or not the livestock men want a public stockyard is a matter for them to decide. Opinion on this subject is very much divided, although there seems to be a growing sentiment in favor of it. There are several things that a stockyard would do. In the first place it would establish a market; that is, it would establish a center where it would be possible to ascertain exactly what cattle are selling for. It would undoubtedly increase the spread in prices paid, which at present is entirely too small. It would have a tendency to establish grades, for cattle at stockyards sell on their merits to competitive buyers.

It seems as though this ought to develop into a good feeder market. It would not necessarily do away with all trading in the country, but it would make a centralized place where buyers from all over this State and

the past there have been many abuses of the stockyards, yet this fact remains evident: it is possible to localize these abuses and take some remedial measures. This has been done in the great stockyards under Federal livestock market supervision, and the work has met the approval of both packers and producers. This supervision was only a war-time measure, but if the Kendrick bill is passed it will make permanent a Federal regulation of stockyards on sane, conservative and rational lines.

Canner Cattle.

The development of the canned meat industry to the point where it would absorb the cheap cows and canner steers would undoubtedly make it possible to make it come nearer getting the value out of the better grades of fresh beef. It does not matter how much a retail butcher may desire to handle only first-class goods, if he is forced into competition with a butcher who handles cheap goods he must buy cheaper stock. This forces down the price for good dressed steers and is reflected in their values in the country. All indications are that canner stock has been the stepping-stone by which the Oriental has established so firm a foothold on the market in the Bay Cities. Both cattlemen and packers declare that San Francisco will not pay the price for good cattle. This may or may not be true. However, since the Bureau of Markets established an office here last fall, there have been very few times that the best steers on the market sold for as much more than the poorest as the quality seemed to justify. They had to compete over the retail block with canner stock. If some plan could be developed whereby this canner stock could be diverted from the retail trade to the channels where it properly belongs it would be a source of great benefit and relief to both retailers and cattlemen.

Education.

A study of the upward trend in food prices since the beginning of the war will show that the percentage of increase in the cost of beef has been less than that of any other important article of food with the one exception, I believe, of coffee. Just now the wholesale price of beef is rapidly approaching pre-war prices, yet consumption seems to be on the decline. Local wholesalers say that 20 per cent less beef was consumed in San Francisco in May, 1919, than in May, 1918. If this is true it is a serious condition and a campaign of education and publicity would help to remedy it. The orange growers created a world market for their products in this way. The raisin people have done the same. The dairymen have found it profitable to tell the public about the food value of milk, cheese and ice cream. The apple growers have made a household jingle out of the slogan, "An apple a day keeps the doctor away." But we see nothing about the food values of beef, about its relative low cost, or any of the many good things that might be told about it.

The question naturally arises, how can these things be done and who is to do them? That, as Mr. Kipling says, "is another story."

TREAT COWS LIKE MOTHERS.

Dairy cows have highly nervous temperaments and rough treatment or worrying of any kind is reflected in the milk flow, and consequently, in the cream check. A sign which should be in every dairy barn is the one put up by the late ex-governor Hoard years ago and is still to be seen in the Hoard Farm dairy barns. It reads: "The rule to be observed in this stable at all times toward the cattle, young and old, is that of patience and kindness. A man's usefulness in a herd ceases at once when he loses his temper and bestows rough usage. Men must be patient. Cattle are not reasoning beings. Remember that this is the Home of Mothers. Treat each cow as a mother should be treated. The giving of milk is a function of motherhood; rough treatment lessens the flow. That injures me as well as the cow. Always keep these ideas in mind in dealing with my cattle."

Summer Advantages of the DE LAVAL

The superiority of the De Laval Cream Separator is more apparent and is more appreciated during the summer months than at almost any other time of the year.

Farmers appreciate the De Laval during the busy summer season because of its large capacity and the fact that it is easy to turn and easy to clean.

With a De Laval, the milk is taken care of in the shortest time and with the least effort—both important in hot weather when a number of other things have to be done

Quick handling of milk and cream in hot weather maintains the highest quality of both, and often means the difference between profit and loss.

Over 2,500,000 De Laval are in daily use the world over—more than all other makes combined. More than 50,000 local agencies look after the needs of De Laval users.

If you don't know the De Laval agent in your community, write to the nearest De Laval office.

Poultry and Rabbits for Profit

Conducted by R. H. Whitten.

DUCKS AS A SIDE LINE.

Only 7.9 per cent of the farms in the United States raise ducks, and probably the percentage is even less in California alone. This is a condition hard to understand, for ducks can be raised at a profit on most farms. They are not as well adapted to the average farm conditions as chickens for a source of income, yet they make quick money. In the time it requires to bring a small Leghorn broiler to 1½ pounds a duckling can be made to weigh from 4 to 6 pounds. However, the demand for table ducks at good prices is mostly confined to large cities and is not as general as the demand for chickens; also the demand for duck's eggs is more limited. Consequently, it is not advisable for the average farmer to go into the venture on a large scale, but a small flock can be raised with profit, and variety in both meat and eggs will be added for the table.

No other birds are easier to raise with less chance of loss by death, if certain fundamental principles of management are adhered to. Ducks can

green and vegetable feeds and a larger proportion of mash, as grain feeding during the first three or four months is liable to bring on digestive troubles. Ducklings do not need feed until they are from 24 to 36 hours old. They should be fed five times a day for the first week; after that, four times a day until they are two or three weeks old, and thereafter three times daily until they are marketed. The first ration should consist of a mixture of equal parts of rolled oats and bread crumbs, with 3 per cent of sharp sand and a little charcoal mixed in. When the ducklings are about three days old, this feed is changed to equal parts of bread, rolled oats, bran and corn meal. After the first week the ration should be changed again to three parts of bran, one part each of middlings or low grade wheat flour and corn meal, 10 per cent of green feed, and 5 per cent of beef scrap, with about 3 per cent of sand or grit, and a little charcoal. The amount of beef scrap is gradually increased until it reaches 15 per cent by the end of the third week. The proportion of corn meal is increased and the bran decreased as

A small flock of ducks can be kept on the average farm with profit. The Pekin is the most popular breed for the production of meat.

get along very nicely without swimming water, though it adds to their enjoyment and cleanness of feathers, and the irrigation reservoir affords an ideal pond for them. They are less subject to disease than chickens, and what few diseases they have are generally brought on by poor methods of feeding. Mites and lice do not trouble them, and if adult birds are supplied with clean hay or straw in an open shed at night they will be contented and do well.

There are 11 standard breeds of ducks, divided into three classes: (1) the meat class, including the Pekin, Aylesbury, Muscovy, Rouen, Cayuga, Buff and Swedish; (2) the egg class, which includes the Indian Runner; (3) the ornamental class, composed of the Call, the Crested White and the Black East India.

Growing Green Ducks.

A green duck is a duckling which has grown rapidly and is marketed when from 8 to 12 weeks old, weighing from 4½ to 6 pounds. This rapid growth is made possible by an abundance of care and good feeding. The highest prices for ducks are usually paid early in the spring. As a matter of fact, many farmers market their ducks in the fall at a lower price than green ducks bring in the spring.

The Pekin breed is kept almost exclusively by producers of green ducks. Ducks of this breed are hardy, make fairly good layers and are practically nonsetters. The standard weights of adult drake and duck are 9 and 8 pounds respectively. They are easily confined by low fences, and are a good breed to raise as a side issue on a general farm.

Feeding Ducklings.

Ducks may be fed on the rations recommended for baby chicks, but better results are secured by adding more

the time for marketing approaches.

Finishing for Market.

The fattening ration, which should be used for two weeks before killing, consists of 3 parts by weight of corn meal, 2 parts of low grade flour or middlings, 1 part of bran, ½ part of beef scrap, 10 per cent green feed, and 3 per cent grit. This mash is fed three times daily. The green feed is sometimes left out of the ration during the last week of fattening, as it tends to color the meat, but it is easier to keep the ducklings in good condition if it is included. Rations recommended for milk-fattened chickens will produce a well-bleached green duck, and skimmilk should be used when it is available. Celery seed is sometimes added to flavor the flesh.

Indian Runners the Egg Breed.

For the general farmer who is more interested in obtaining eggs than in producing green ducks for the market, the Indian Runner is a good breed. This duck holds the same relative position in the duck family that the Leghorn does in the chicken family. It lays a good-sized white egg, considerably larger than a hen's egg, and is a small eater, a good forager, and hardy. The introduction of the Indian Runner has helped in building up a trade for ducks' eggs, yet only in certain localities can good prices be secured, and the possibilities of securing a market should be investigated in advance. These eggs need to be marketed often as they depreciate in quality more rapidly than hen's eggs.

Do not feed a sloppy mash to your fowls. Let it be dry enough to crumble good. Sloppy food is quite sure to cause bowel trouble. Do not forget the grit. The fowls cannot get along without it any better than you can without teeth. The sharper the grit the better.

HATCHING TURKEYS OUT OF SEASON.

We wish that we had space to reproduce a picture sent us by Mrs. T. F. Carney of Smith, Nevada, showing some turkeys raised by her. They are about as fine a lot as we have ever seen, and they were raised out of season at that. In writing about them Mrs. Smith says:

"I have the Mammoth Bronze variety and think them the largest and best. First of all there is no mother equal to the turkey hen for brooding young poults. Last October one of my hens came off with 14 vigorous little turks. She mashed two when they were young, but raised 12. I put them all in a large garden and fed them very little, for they almost lived on bugs, flies and grass. The latter part of November we had some snow, so I put them in a good chicken house and never turned them out until about ten in the forenoon, or if it was stormy I kept them in all day. They grew very fast and when the heavy snows and extremely cold weather came I kept them in for a week at a time, having before them continually plenty of clean grit, fine charcoal and pure water. The food consisted of scraps from the table, some wheat, occasionally a bran mash, and sometimes a feed of cornmeal mixed with sour milk. The 12 turkeys weighed 116 pounds and dressed 100 pounds. I received 40 cents per pound, so they brought me \$40, and I think I was well paid for my trouble. The largest tom weighed 12 pounds."

RABBITS HAVE SPOTTED LIVER.

What is the cause of spots on the liver of young rabbits, and what should I do?—Mrs. L. E. R., Ukiah.

This is due to a small parasite which attaches itself to the liver and causes a diseased condition, finally getting so bad that the liver rots away. The patient generally has trouble in breathing and can be heard quite a distance. The rabbit generally eats well, but has a strange appearance. It is said that this will not occur if rabbits are fed carrots twice a day. Also plenty of dandelions are recommended as a cure, except in severe cases, when it is best to kill the rabbits at once. It is not wise to use for breeding purposes a rabbit that has been so affected.

Something queer about hens and even chicks turning cannibals and eating each other up alive. The best explanation so far is that the birds need more meat. A bit of a scratch comes on some hen, and the rest see the red spot or the drop of blood, and out of curiosity pick it off. That gives them a taste of the blood, and at it they go to devour the poor creature. If plenty of beef scraps are given, the chances are that you will never have any trouble of this kind.

Green cut bone can often be purchased from the butcher. When procured fresh it makes an excellent substitute for beef scrap. It should be purchased in small quantities, as it cannot be kept fresh for any length of time, and when spoiled may cause bowel trouble. It is best fed in a trough, not oftener than every other day, allowing about one-half ounce per bird. Should severe or continued looseness of the bowels follow it should be discontinued, or the quantity reduced.

In every flock of chicks there are a few that are not as strong as the average. These will die, or at least will make poor growth, if they have to take their chances in a large flock. If you use colony hovers it will pay well to keep a small lamp-lighted hover in operation, into which the weaker chicks may be placed. Protected and given a better chance, they will make good growth and may be made a source of profit instead of loss.

The meanest man on earth has been discovered. He had a rooster that woke his neighbor up at 4 o'clock every morning for two years, and the very night before the neighbor wanted to catch an early morning train he killed the rooster.

NEW ZEALAND REDS—First class utility does bred \$5.00 each. Young does, \$2.50 each. F. R. Caldwell, Broadmoor, San Leandro.

RAISE RABBITS FOR US—We supply the breeding stock. Send stamp for particulars. R. E. Gibson Co., Arcadia, Calif.

WET OR DRY MASH?

For years the "wets" and "drys" in the United States have been fighting, and at last the "drys" have won. But how about the "wet" and "dry" systems of poultry feeding? Should this "dry" system become universal too?

Both systems have their supporters; both have their advantages and disadvantages. The wet mash has been used since the earliest days of poultry culture, and it is only during recent years that the dry mash has received much attention.

The wet mash is sometimes referred to as the "hardwork" method. It involves the feeding of a moist mash at a stated time each day—generally in the morning. The mash has to be mixed with just the right amount of water; the troughs have to be cleaned frequently; and any mash left uneaten must be taken away. All this means hard work—downright hard work—and it has to be done every day in the year. Probably it is the hardest part of the average run of poultry work—at least when it is done in a proper and thorough manner.

With the dry mash system a mixture of ground grains is kept before the birds at all times. This permits the mixing of several hundred pounds of mash at one time, which can be stored and used as the hoppers need refilling. This greatly minimizes the labor of feeding, as it is simply necessary to glance at the hoppers occasionally and during odd times refill any that are getting low.

There is little or no danger of the feed becoming sour and causing digestive troubles. There is no crowding at the feed troughs, and birds do not gobble down a lot of it at a time as they do when a moist mash is fed. It was the old-time moist mash that enabled the hoggish ones in a flock to stuff their crops and then go on the roost to idle the time away until the mass was digested. Those were the birds that came down with liver or digestive troubles, and that accumulated fat until they were baggy behind and worthless as layers. With the dry mash, birds eat no more than they crave, and only a few mouthfuls at a time. Also they give it the proper "mouthing."

All food eaten by both hens and humans should be moistened with saliva, and for this process Nature has provided salivary glands located near the base of the tongue. When so moistened the food is in right condition for the juices of the stomach in humans, and the gizzard and intestines in fowls, to carry on the digestive process. Consequently, when mash is eaten dry the process of digestion begins in the mouth where it should, and the dry mash system seems to be the natural method.

The amount of dry mash it is desired to have hens eat may be regulated by the amount of whole grain fed. If you want them to eat more mash and do better laying, cut down on the scratch feed. If you want them to eat less mash and slack up a little on their laying, increase the whole grain.

The objection is sometimes offered to the dry mash system of feeding laying stock that the birds will overeat, but this rarely occurs with the more active breeds. It may happen occasionally with some of the heavier breeds, but in such a case the hopper can be kept closed until noon. It certainly is much less work to merely open up the hopper than to be obliged to mix up and feed a wet mash; then return in a half-hour to see if all has been eaten.

From the standpoint of the farmer who carries poultry as a side-line, and wants to be taken from his regular work as little as possible, probably the dry mash method of feeding is the most important step made in poultrydom in recent years. It not only effects a great saving in labor, but gives most excellent results in the health of the flock and in the egg yield. And this means greater profits.

A colored man was asked what breed of chickens he considered best. He replied, "All kinds has der merits. De white ones is de easiest to find, but de black ones is de easiest to hide after you gits 'em."

Home Office, 310 South Hill Street
Los Angeles, Cal.

A storekeeper complimented a certain rancher on the clean and attractive condition of his eggs at all times and asked him how he did it. He said that he changed the straw in the nests weekly, removing every particle of old straw and dirt. He claims that he never gets a dirty egg, therefore never has to clean any. His eggs always have nature's bloom, which once marred or removed cannot be replaced.

Do you scald your chick fountains occasionally? Not every day but now and then, to make sure that they are reasonably clean. A chick would rather drink from a puddle than anything else, but that is no reason for giving him a filthy fountain. acres of otherwise idle land.

Every individual in the flock should show vigor and strength. Size (not fat), erectness, activity, bright eye, and red comb are favorite points indicating good constitution. Drooping tail or wing, weakened legs, head and neck not erect, denote weakness. Pullets bred from good layers are preferable. A good layer will be a hearty feeder and usually a vigorous worker.

Boys and girls should be encouraged to start in the poultry business. It requires little money, and the current expenditure may be reduced in part by utilizing farm and home wastes. If the project begins with a laying flock the return begins early, especially by supplanting the food supply of the home.

GLOBE "A-1" FEEDS

Globe "A-1" Poultry Mash —with dry buttermilk

Baby Chick Mash

The nutritious hearts of whole grains, ground and scientifically balanced with real dried buttermilk to make a wholesome feed on which chicks thrive. Makes chicks live and grow in robust health.

Growing Chick Mash

A food designed to make chicks develop into egg producers in the shortest possible time. Contains real dried buttermilk. Should be fed until chicks reach age of 5 months, then get

Globe "A-1" Laying Mash

for quick results in the egg basket. Contains real dried buttermilk. The use of buttermilk in poultry feeding has the indorsement of U. S. Agricultural Dept. (See Bulletin 162, Berkeley, California)

Put prosperity into your poultry yard. Start on these three great feed today. See your dealer—he has all the Globe "A-1" Feeds.

GLOBE MILLS

Los Angeles San Francisco

Globe "A-1" Swine Feeds —with dry buttermilk

Three kinds, one for baby pigs, one for growing pigs, one for fattening hogs. Scientifically compounded to suit age of animal. All kinds contain real health-giving dried buttermilk, in correct proportion to make animal grow, mature rapidly and take on a load of profit-making fat. Ask your dealer.

Globe "A-1" Stock Feed —with molasses

A well-balanced ration containing the proper amount of such concentrate feeds as soya bean meal, milo maize and other grains in combination with chopped alfalfa and desiccated bean straw. The whole ration treated with heavy addition of Hawaiian cane molasses. Palatable, nutritious—a winner either as a dairy or a fattening feed.

Globe "A-1" Dairy Feed

A high-protein concentrate to balance roughage available on your ranch. All we ask you to do is to weigh up the milk before and after feeding this remarkable feed for a few weeks.

—here is a book you cannot afford to be without. Practical, sensible—a sane talk by experts who know how to raise poultry, swine and stock. Write for it now.

THE HOME CIRCLE

A PATERNAL YEARN.

"E'en 'father' sounds a trifle cold, and 'papuh' makes not a hit with me. I love that word of purest gold I used to lisp in infancy.

There's too much flippancy to 'pop,' and 'pater' always makes me mad. I like but one of all the crop; I want my boy to call me 'dad'."

"I want to win the urchin's love, yet want no love he has to feign.

I do not care to be his 'gov' or fix a gulf between us twain.

I want to be the kidlet's chum, to be a comrade for the tad;

And when he gets to talking some, I want my boy to call me 'dad'."

—Selected.

MAKE COMPANIONS OF YOUR CHILDREN.

How many parents make companions of their children? How many try to make the child feel that he is a necessary part of the family unit? Do you merely feed and clothe your children, letting them just "grow up," finding their own friends, amusements, etc.? Why not take a day off occasionally and go with them to the woods and watch the birds build their nests, learn their various calls, and how they feed their little ones? Equally interesting is it to watch the small toilers in the grass, sometimes laboriously toiling for hours to carry a blade of grass or a dead beetle or fly over the obstruction of a small stick or rock. Of course, children living outside the larger cities have the opportunity to make the acquaintance of the furred, finned and feathered tribes, but how many of them know how to study these creatures intelligently? A child will satisfy its curiosity regarding a bug or spider, in a few minutes, never taking into account the reasons for certain actions of the subject under consideration. An older person can explain in an educational way, and make these little nature studies of the greatest interest and benefit, all the time cultivating and cementing the companionship between him or herself and the child.

Enter into the plans and ambitions of children, for no matter how trivial their problems may seem to you, to the child mind they are sometimes insurmountable difficulties; and to talk it over in a calm way with an older, sympathetic mind, displaces doubt with confidence, fear with courage, and promotes a greater love for, and fellowship with, the parent who is wise enough to see his child's need and "supplieeth it."

Children of school age should be given responsibilities, either a small garden, rabbits, pigeons or chickens, and should understand that they are responsible for the care of same. This affords an opportunity for friendly discussion between parent and child regarding the latter's activities with his pets or garden, as well as a further opportunity for entering into the plans and daily interest of the child, as before mentioned. This gives a common interest and puts them upon the same plane, so to speak.

Talk to your child; ask him his opinion about things concerning the home, the ranch or the farm. If his answer is not what you think it should be, ask him his reasons therefor. Then suggest that thus-and-so would be a better plan, and tell him why you think so. Make him feel that his opinion is worth something. Draw him out and make him think, and express himself. It fosters self-confidence and broadens his horizon; it cultivates his powers of observation until his opinions grow to be really worth something eventually.

Such an association wins a child's confidence and develops a spirit of camaraderie, altogether too rare between parents and their offspring. Cultivate the habit of chumming with your children, and see how they respond to the treatment.—Z. D. H.

BEATING THE HIGH COST OF LIVING.

(Agnes Boeing Extension Service of College of Agriculture, University of Wisconsin.)

Washing Clothing Materials.

The action of the common laundry soaps and washing powders on the different types of clothing materials must be noted by the housewife who wishes to obtain the best results in cleaning clothing at home. Cotton and linen, the vegetable fibers, are not injured by dilute alkali solutions such as are found in strong washing soaps or powders. Silk and wool, the animal fibers, are affected by strong soaps on account of the alkali. Strong soaps and washing powders, if used in washing woollens, flannels, or white silks, make them yellow and harsh and injure the fiber. A dilute boiling solution of household lye in water will completely dissolve woolen material.

Great care must be taken in washing woollens because of the character of the fiber. The outer surface of the wool fiber as seen under the microscope, consists of little overlapping scales. These little scales hold the fibers apart so that they enclose the air in their meshes, making wool of great value as a warmth-giving fabric.

When the wool is immersed in hot water, especially when a strong soap is used, these scales rise and stand out like the scales on a pine cone. In this condition the scales are easily locked or felted and, when rubbed, the fibers draw together, or shrink.

The alkalis which are found in soaps and washing powders may help to make the woolen fiber swell and become felted unless very carefully used. The same warmth in all wash waters and in drying is very important. Differences in temperature will shrink wet woollens.

In washing woolen material it is best not to rinse it in entirely clear water, since the water tends to remove from the wool the natural oils which give it luster or dressing and to leave the wool rather harsh and stiff. This difficulty may be overcome by leaving a small amount of lather in the rinsing water. The soapy odor will disappear from the material after it has been hung in the wind.

Another way to overcome the harshness is to replace the oil which washing removes from the wool by adding in the last rinsing one tablespoon of glycerine to two gallons of water. The material should be run through the wringer and hung out until partially dry. When the material stops dripping, it may be rolled lightly and allowed to stand for an hour or so and then ironed while damp.

Ironing Woollens.

The best method in ironing woollens is to place a muslin cloth over the right side of the damp woolen material and press until dry. It is best to pull the basting threads, which locate the stains, before pressing, in order to avoid thread marks. If any stains remain after the material is washed they are probably obstinate grease stains which can be removed by the application of gasoline.

Old Hats Can Be Made to Look New.

The housewife often places the summer hat away in the fall with good intentions of wearing it again next

spring, but she is likely to feel disappointed when she takes it from its winter hiding place. The brilliant coloring of the outdoors in spring makes the feathers, flowers, or ribbons look faded and worn, by contrast. It is not until the flowers or feathers are retinted and the velvet ribbons are steamed that an old hat will look new.

Cleaning Ostrich Feathers.

Soiled ostrich feather, aigrettes and paradise plumes can be cleaned best in gasoline and flour mixture.

Take a deep bowl large enough to work the feather easily and use the proportion of one pint of gasoline to two tablespoons of flour. Mix thoroughly and immerse the feather, rubbing it carefully toward the tip in working. Squeeze out the excess gasoline when the feather is clean and shake it in the air until dry. If the feather is very soiled it is advisable to put it through a plain gasoline bath first, to remove some of the dirt, before putting it into the flour and gasoline mixture. If the gasoline is allowed to settle the top may be poured off and used again.

Tinting Feathers.

To renew or change the color of ostrich feathers, flowers and such materials as velvets, crepes, nettings and light-weight silk, tubes of oil paint may be used.

Mix the paint in a bowl with gasoline. Be careful to dissolve the paint in a small amount of gasoline first and to add enough gasoline to dilute the mixture to the color desired. After the feathers have been dipped into the tinting solution until colored remove them quickly and shake in the air until dry. As the gasoline evaporates rapidly, it will not remove the curl. If a darker tint is desired at the tip end of the feather, repeat the process with the tip end of the feather until it is sufficiently colored. Do all this out of doors, away from any fire. The color of velvets after tinting is better if they are dried by dripping and fanning in the air without squeezing.

Tinting Beaver.

Beaver hats, heavy laces and felt hats are best tinted by using dry powder paints in any desired color such as blue, brown and tan.

Mix the paint with cornstarch or talcum powder and rub upon the hat. Let stand a few days. Brush before wearing.

In cleaning white beaver hats and white furs, use two tablespoons of wheat flour to every pint of gasoline, as in cleaning feathers. Rub the mixture into the hat or fur and shake it out when dry.

Cleaning Velvets.

One way to restore the color of velvet and to clean it is to brush it lightly on the right side with a sponge dipped in chloroform. This must be done in front of a window and away from fire as the fumes of chloroform are likely to produce drowsiness and headache.

Steaming Velvet.

To steam velvet, hold it over the spout of a boiling teakettle and, when dry, brush it carefully to raise the nap. Another way to steam velvet is to place a hot iron between two bricks with the flatside of the iron up. Cover the hot surface with a damp cloth and then draw the velvet over it, right side up. The steam rising through the velvet will remove the creases and raise the nap. When the velvet is dry, brush the nap with a fine, soft brush. If stiffening is desired sponge the

wrong side with a little weak ammonia water to which gum arabic has been added.

Puckeriness isn't tea-taste; it's tannin-taste. Tannin is what they tan leather with.

You don't want that? Then pay enough per pound for your tea to get the real tea-flavor— $\frac{1}{3}$ cent per cup.

Schilling Tea is the fine practical economical tea of this country.

There are four flavors of Schilling Tea—Japan, Ceylon-India, Oolong, English Breakfast. All one quality. In parchment-lined moisture-proof packages. At grocers everywhere.

THE SONG OF A BIRD.

By Dr. T. J. Merryman.

As the birds went south from the cold and snow,
There was one last fall that did not go.
His wing was weak, or his mate was dead,
Or in some other way he had lost his head.
Or if by chance he did migrate,
In the flight he must have lost his mate.

So he flew right back to the old home tree,
In search of the one he long to see;
But he found her not, and all winter long,
He sang alone his pewee song.
Yes, day by day this brave little bird
Would let his musical voice be heard.

In spite of the wind from the frigid north,
A song of enchantment he would pour forth.

'Mid falling snow on stormy days,
We heard the warm and pleading lays.
And thus it was the winter through,
His heart was light and his voice rang true.

Sometimes the song of a bird that we hear,
Will bring to us lessons of trust and cheer.

And these we learned from this pewee bird,
Whose cheerful notes we so often heard:

Let hearts be brave and voices sweet,
Whatever the atmosphere we meet.

With cheerful song let's begin the day,
And drive all anxious cares away;
And as the storms of life we brave,
With buffeting wind and surging wave,
'Neath clouds o'ercast or clear blue sky,
Remember our Father who reigns on high.

PROCRASTINATION.

He meant to insure his house, but it burned before he got around to it.

He was just going to pay a note when it went to protest.

He was just going to help his neighbor when he died.

He was just going to send flowers to a sick friend when it proved too late.

He was just going to reduce his debt when his creditors "shut down" on him.

He was just going to stop drinking and dissipating when his health became wrecked.

He was just going to provide his wife with more help when she took to her bed and required a nurse, a doctor and a maid.—Success Magazine.

TO PREVENT DOUGH FROM STICKING.

Make a cover of stockinette or any elastic knitted textile to pull over the rolling-pin in a stretched-tight way, and tie at the open end. Then take a square of canvas to lay upon the bread board. The softest dough can be worked without danger of its sticking. But before using, nearly a quart of flour must be rubbed into the rolling-pin cover the first time it is used. With careful use the covers will stay clean a long time. When necessary to wash them, use cool water and a small brush.

OUR FLAG.

"I have seen the glories of art and architecture and of river and of mountain. I have seen the sunset on the Jungfrau and the moon rise on Mount Blanc. But the fairest vision on which these eyes have rested was the flag of my country in a foreign port. Beautiful as a flower to those who love it, terrible as a meteor to those who hate it; the symbol of the power and the glory and the honor of one hundred millions of Americans." — Senator George F. Hoar.

THE RED, WHITE AND BLUE.

"Her lips are red,
Her eyes are blue,
Her brow is white above;
Unto the flag, O heart, be true!
For it belongs to love."

OUR "GARDEN FLOWERS" IN SOUTHERN CALIFORNIA.

[Written for Pacific Rural Press.]

Miss Florence Yoch, landscape architect of Los Angeles, who has designed and executed some of the most beautiful ornamental horticulture in Southern California, honors us with this frank and cordial letter:

For a long time, more than two years, in fact, I have wanted to write to tell you how much I have liked your book, "California Garden Flowers." In my work in gardening in Southern California I have found it the solidest help of any California book and have loaned my copy to my clients and their gardeners. Especially its information as to seasons and sections is enlightening to the many brand new Californians with which this region is populated. Also this past summer, in helping direct the 900 Land Army girls here locally, I drew heavily on you. This winter Mrs. Francis King, vice-president of the Garden Club of America and president of the Woman's National Farm and Garden Association, has been here and was very eager to get correctly oriented as to California conditions so I gave her your "Garden Flowers."

Several years ago Miss Yoch was a student in the University of California and afterwards completed her professional training at the University of Illinois. She not only knows what good landscape design and gardening are, and how to do them, but is a good judge of what assistance is helpful to the same end.

When we thanked Miss Yoch for her approval and asked her permission to share it with the readers of the Rural Press, she suggested that Mrs. King should be requested to authorize the use of her name as printed above. Mrs. King has consented thereto in this gracious note:

"Let me say at once that I am not only glad but proud to have you use my name in connection with your book, 'California Garden Flowers.' I expect to use your book here almost more than I did in California to refresh my memory concerning the amazing number of lovely things, all new to me, which I saw on my first visit to your state, just now. I am glad to know, too, of so excellent a book to recommend to people going to California."

LOUISA YEOMANS KING.

Alma. Mich.

Such tokens of generous appreciation are a writer's jewels.—Editor.

TINTING CURTAINS.

Yellow ochre is the best thing that I know of for tinting curtains after they have been washed. It gives them a soft, creamy appearance as when new, or they can be tinted a creamy shade of yellow. Many use coffee, but if they once tried yellow ochre, they would never use anything else. Another thing in its advantage is, that it is cheap and can be bought at any place where paints are sold. Another thing in its favor is that it is always ready, as all one has to do is to moisten it with a little cold water and then strain it through a piece of cheesecloth, adding enough water so that the curtain can be thoroughly dipped in it. A teaspoonful is sufficient to do several curtains and to this amount one should add about six or eight quarts of water.

Keep this stirred while dipping the curtains. If the solution is very weak, allow the curtains to lie in it for about 30 minutes or so, keeping them stirred once in a while. This is often done if one wishes a very delicate creamy effect.

Nothing will brighten up a dark room as much as curtains that are tinted a creamy yellow. The effect is very pleasing.

Men's and boys' faded khaki overalls, pants and suits can be re-colored with yellow ochre by dipping them up and down in a stronger solution than it takes for curtains. This must be done, however, each time they are washed. It means, instead of putting them through a bluing water they are put through a yellow ochre water. —Margaret Palmer.

TIMELY RECIPES.

Cherry Cobbler.—Butter a shallow pan and half fill with ripe stoned cherries, well drained. Add sugar to sweeten well, and sprinkle with a pinch of salt. To one cupful of sour cream (if cream is very thick, use half milk, or milk and butter may be used), add one-third teaspoonful each of soda and salt, and flour to make a thick batter. Pour the batter over the cherries to cover well, and bake in a brisk oven until nicely browned. Turn out of the dish, fruit-side up, on a platter, and serve hot with a sauce made with cherry juice.

Cherry Cream Pie.—Line a pieplate with nice pastry, fill it with stoned ripe cherries, stir one teaspoonful of cornstarch or flour into one cupful of sugar and strew over the cherries, dot with bits of butter. Beat one egg light, mix it with one-half cupful of rich, sweet cream, and pour over the pie. Bake until the custard is set.

Cherry Trifle.—Select large sweet cherries, stone them and chop fine, and let them drain while preparing the cake. Cut a stale sponge cake into slices, put a layer in a glass dish, moisten with orange juice mixed with the juice strained from the cherries, spread thickly with the chopped cherries mixed with a generous amount of sugar, adding a few chopped almonds. Repeat the layers until the dish is nearly full, and let stand in the icebox for half an hour before serving. Just before sending to the table, pour over a pint of whipped cream.

Cherry Roll.—Make a rich bicuit dough and roll out on a well-floured board to one-half inch in thickness. Spread lightly with butter, and sprinkle thickly with very ripe stoned cherries, add sugar to sweeten well, dust with a bit of cinnamon and a pinch of salt, then roll up like a jelly roll cake, pinch the ends together to prevent the escape of the juice, and bake for about three-quarters of an hour. Cut in slices across the roll, and serve hot with a pudding sauce.

Thousand Island Dressing.—One cup bottled salad dressing, two tablespoons chopped parsley, two tablespoons chili sauce, two tablespoons chopped sweet pickles, two tablespoons chopped pimento. Chill all in-

gredients, mix and serve over lettuce or other salad greens.

Tartar Sauce.—One-half cup bottled mayonnaise dressing, one tablespoon chopped onion, one tablespoon chopped pickles, one tablespoon chopped olives. Chill and mix all ingredients. Serve with canned or fresh fish.

COOKING HINTS.

If a little flour or corn meal is sprinkled on potatoes before frying, they will be a delicious golden brown when done.

To economize in lard, buy a quantity of fresh leaf lard cones when they are cheapest, run through the meat chopper and try out. Then every two or three weeks, or as often as needed, buy about three pounds of fresh suet, run this through the meat chopper, try it out and mix it with an equal quantity of the leaf lard. The mixture can be used whenever it is customary to use lard.

Pour boiling water on oranges and let them stand five minutes. This will cause the white lining to come away clean with the skin, so that a large quantity can be quickly sliced for sauce or salads.

To shell pecans and walnuts easily, pour hot salt water over them and let them stand for awhile.

Market Comment

Barley Futures Near \$3.

December barley jumped on the San Francisco exchange this week to \$2.98 which is an advance of 7 cents over the record of the previous day's quotation. The rise was due to the exceedingly strong barley market in the East.

Hides Higher.

The hide market shows up strongly and some of the highest prices ever quoted have recently been announced. No. 1 wet salt kip, 15 to 30 lbs. has been quoted as high as 38 cents. The demand is strongest for good quality hides of the heavier weights.

Imperial Valley Long Staple 52c.

The Imperial Valley Long Staple Cotton Association recently sold between 200 and 300 bales of Pima cotton for the best price secured in that valley the past year. The sale was made at Boston averaging slightly over 52 cents net to the grower. Growers are elated at the opening of the eastern market to the valley long staple.

Wage Scale for Fruit Pickers.

Ralph P. Merritt recently appointed by Governor Stephens to determine a fair wage scale for employees in the cannery and dried fruit industries has announced the wage scale for unskilled labor for the 1919 packing season as follows: "For the first eight hours 45 cents an hour or \$3.60 for an eight-hour day. For the ninth hour and every hour thereafter there shall be paid 55 cents an hour. Fifty-five cents an hour shall also be paid for all day work and on Sundays and the following holidays: July 4, Admission Day, Labor Day, Thanksgiving Day, Christmas and New Year's Day."

Shippers Short of Shook.

It is rumored that there is a prospective shortage of shook boxes again this season which necessitates a raise in price and threatens to leave some fruit unshipped. Box makers claim that an increase of 50 per cent over the price of 1918 boxes will be needed. Various reasons are offered by the millmen for the increases. The ostensible cause is increased operating costs such as salary increases, higher freight rates and an advance in the price of rough lumber. Another reason is that new markets for shook are opening to manufacturers among Peruvian oil producers and Hawaiian pineapple growers.

The Depressed Beef Market.

When the hot summer season sets in there is usually a considerably lessened demand for all meats. This with the difficulty of disposing of the surplus supply of beef produced for war needs has seriously depressed beef prices. Representatives of more than forty live stock organizations from every section of the country met and issued a statement declaring that unless an immediate market is found for the live stock men they will be required to greatly reduce the size of their herd which will seriously threaten the country's future supply of cattle and sheep. A campaign of education to induce the public to eat more beef and lamb is contemplated.

Fruit Driers' New Schedule.

Commercial driers have adopted a new schedule of prune prices, as follows: For prunes, \$9 a ton on any estimated tonnage as green deliveries are made to the plant. This charge is based on a wage of 40 cents per hour, and includes receiving, proper drying and binning, the grower to be responsible for binned fruit. More than one extra stacking, or additional service due to the weather or other extraordinary conditions will require extra charge. Driers agree to use their best judgment and deliver properly dried fruit, subject at all times to prevailing weather conditions.

On apricots the price named is \$16 per ton for apricots running 12 to the pound or larger, green; \$18 per ton for smaller fruit running 13 to 16 inclusive.

THE MARKET REPORTS

Figures Given Are Independent and Reliable.
Prices Quoted as Paid to Producers.

SAN FRANCISCO.

San Francisco, July 1, 1919.

WHEAT.

The following prices were announced by the Federal Grain Corporation last year and are still in effect. They are figured f. o. b. San Francisco, Los Angeles, Seattle, Tacoma and Portland, and guarantee the grower a minimum of \$2 f. o. b. shipping point:

Per bushel—	
No. 1 hard	\$2.20
No. 2	2.17
No. 3	2.18
No. 1 soft	2.18
No. 2	2.15
No. 3	2.11
Club or Sonora, No. 1	2.16
do, No. 2	2.13
do, No. 3	2.09
Re-cleaned, per ctl.—	
California	\$4.10 @ 4.25
Early Baart	\$4.15 @ 4.20

BARLEY.

Barley continues to advance in price as the 1918 crop decreases in the stock available for shipment. The quotations for feed and shipping are for the 1918 crop, f. o. b. Port Costa. New feed is quoted at \$2.45 to \$2.55. December futures are rapidly approaching the \$3 mark, sales having been made as \$2.97.

Feed \$2.70 @ 2.80
Shipping \$2.85 @ 2.90

OATS.

Oats were advanced in price this week in sympathy with the upward movement of barley. While the demand is not great for either grain locally, it is reported that it is sometimes difficult to find enough here to satisfy immediate delivery in quantity.

Red feed, per ctl. \$2.50 @ 2.60
Red for seed Nominal
Black for seed Nominal
Re-cleaned Red or Black for seed Nominal

CORN.

There is no movement this week in corn, which is firm at the prices quoted.

California \$3.30 @ 3.50
Egyptian, choice Nominal
Milho Nominal

HAY.

Receipts of hay for the past week were 1234 tons, compared with 1686 the previous week. Practically all receipts were from the new crop and future quotations will be this crop only. Receipts are light for the time of year and arrivals were moved without difficulty at prevailing prices. The majority of dealers feel that prices of grain hay will be easier as soon as normal receipts are available on this market. Alfalfa from the interior has been in good demand, but little other than the first cutting is ready, and this is heavily laden with foxtail, rendering it unfit for anything but stock feed.

No. 1 Wheat, per ton	\$15.00 @ 17.00
No. 2 Wheat, per ton	12.00 @ 14.00
Choice Tame Oat, per ton	15.00 @ 17.00
Wild Oat, per ton	10.00 @ 12.00
Barley Hay, per ton	11.00 @ 13.00
Alfalfa, per ton	14.00 @ 16.00
do, new, 1st cutting	9.00 @ 11.00
Stock Hay, per ton	9.00 @ 11.00
Barley Straw, per bale	.50 @ .80

FEEDSTUFFS.

The supply of feedstuffs in this market seems to be less than the demand, although the latter is not considered heavy. With the advancing price in the whole grains, especially

in barley, the rolled grains were increased in price, rolled barley advancing to an extreme of \$6 and rolled oats \$2. Alfalfa meal was also strong and higher. The price of oil cake meal showed a decline of a dollar on the turning of the demand to the other feed-stuffs.

Bran	\$45.00 @ 46.00
Middlings	52.00 @ 53.00
Shorts	46.00 @ 48.00
Cracked corn	72.00 @ 73.00
Rollod barley	58.00 @ 60.00
Rollod oats	53.00 @ 55.00
Alfalfa meal	33.00 @ 35.00
Cocunut meal	48.00
Oil cake meal	71.00 @ 72.00

POTATOES, ONIONS, ETC.

There is little movement in potatoes and the market is affected by the holidays, as well as the season. Yellow onions were higher, but with this exception the entire list showed a tendency to sag. The summer seasonable vegetables are all lower, with fair demand and good receipts.

String beans	5 @ 6c
do, Garden	10c
Peas	7 @ 9c
Carrots, per sack	\$1.50 @ 1.75
Asparagus	6 @ 8c
Rhubarb, Strawberry, box	\$1.50 @ 2.00
Cucumbers, hothouse, box of 30	\$1.50 @ 2.00
Los Angeles	\$1.00 @ 1.25
Eggplant, per lb.	8 @ 12 1/2c
Lettuce, per crate	75c @ \$1.25
Celery, crate	Nominal
Tomatoes, Southern, per crate	75 @ 1.25
Sprouts	Nominal
Summer squash	.50 @ 60c
Green Corn, Alameda, sack	\$4.50 @ 5.00

Potatoes—	
Rivers	None
Oregon	2.00 @ 2.40
Idaho	2.00 @ 2.25
Garnets, new on street	\$3.00 @ 3.50
Other new on street	\$3.00 @ 3.50
Sweets, per sack	None
Onions, Warehouse Stock—	
Australian Browns	Nominal
Onions, new red	\$3.50 @ 4.00
yellow	\$3.75 @ 4.25
Green Alameda	\$1.50 @ 1.75
Garlic	.15 @ 16c

BEANS.

A good demand for blackeyes this week caused an advance in the quotations of this variety, while other prices remained unchanged.

Bayos, per ctl.	\$5.90 @ 6.10
Blackeyes	\$4.00 @ 4.25
Cranberry beans	5.75 @ 6.00
Limas (south, re-cleaned)	.30.00
Pinks	\$5.50 @ 5.75
Mexican Reds	4.50 @ 5.00
Tepary beans	2.50 @ 2.75
Garbanzos	11.75 @ 12.00
Large whites	5.65 @ 5.85
Small whites	6.75 @ 6.90

POULTRY.

The general market is steady, with weakness developing only in hens. Receipts of this description have been heavy, and it has been met by a falling off in the demand. It is felt that hens will go lower than the present price as they cannot profitably go into storage in large quantities at more than 25 cents. This price will probably soon be reached and maintained by the demand for storage. Broilers are strong at quotations. The rest of the list is unchanged.

Turkeys, live, young spring, lb.	Nominal
Broilers, 1 1/2 lbs. and under	.31c
do, 1 1/2 to 2 lbs.	.32 @ .34c
Fryers, 2 to 3 lbs.	.35 @ .38c

NEW WHEAT PRICES ON SAN FRANCISCO BASIS.

The following are the Government terminal prices on wheat, bulk basis, as announced by Julius H. Barnes, the recently appointed Federal Wheat Director, acting for the U. S. Grain Corporation:

Hard White	Per bushel	No. 2	Per bushel
No. 1	\$2.20	No. 3	2.15
No. 2	2.17		2.11
No. 3	2.13		
Soft White	Per bushel	Club and Sonora	Per bushel
No. 1	2.18	No. 1	2.16
		No. 2	2.13
		No. 3	2.09

For sacked grain add 4 1/2c per bushel of sixty pounds to above prices. Deduction of three-fourths of a pound made for weight of each bag. Wheat trading under No. 3 mixed or smutty will be purchased accord to merit.

Smutty Wheat.

Deduct smut dockage from weight. In addition deduct following scouring charge:

If smut contents 1% to 3%, deduct	.02 per bu.
If smut contents 3 1/2% to 7%, deduct	.02 1/2 per bu.
If smut contents 7 1/2% to 15%, deduct	.03 per bu.
If smut contents 15 1/2% and above, deduct	.03 1/2 per bu.

Mixed Wheat.

Discounts on mixed wheat according to percentage of mixture and based on predominating class in the mixture:

Discounts as follows:

Up to and including 20%	.2c discount
Over 20% and including 35%	.3c discount
Over 35% and including 50%	.4c discount

Government Terminal Price.

While Port Costa and South Vallejo are San Francisco Bay terminal warehouses, as well as San Francisco, for Northern California, in all cases the freight to San Francisco from point of shipment is to be deducted from the government terminal price in fixing the value of the wheat at loading point: i. e., all wheat shipped to San Francisco Bay terminals is valued on San Francisco basis, delivered in a terminal warehouse.

Hens, extra, per lb. colored	.30 @ 32c
do, Leghorn	.28 @ 28c
Smooth young roosters, per lb. (3 lbs. and over)	.45 @ 48c
Old roosters, colored per lb.	.22 @ 23c
Geese, young, per lb.	.25c
do, old, per lb.	.25c
Squabs, per lb.	.48c
Ducks, young	.25c
do, old, per lb.	.25c
Belgian hares	.13 @ 14c
Jack rabbits	\$.25 @ 3.50

BUTTER.

July 1, being a legal holiday, the Exchange was closed, and this week's report closes with Monday's quotations. The price of butter declined a cent and a half from Saturday's quotation on Monday. The receipts in the San Francisco market during the past week were about 15 per cent greater than the previous week. Approximately a third of last week's receipts went into cold storage. At the present time there are 1,618,269 pounds in local storage. There are no official figures available for comparison with the amount in storage locally last year at this time, but in the four principal centers of the East the records show an increase of butter in storage of approximately 100 per cent over the previous year.

Extras	52 1/2	52 1/2	53	51 1/2	
Prime firsts					None
Firsts	50	50	50	50	

EGGS.

Extra eggs were a half-cent lower this week and pullets declined two cents from last week's close. There has been no official report of shipment of eggs outside the State during the week. The receipts have been steady, with an inclination to fall off. With hot weather coming in the valleys it is expected that production will show a decline. From this viewpoint it would appear that eggs were more likely to advance than to go lower.

Extras	49	49 1/2	49 1/2	49 1/2	
Firsts					Nominal
Ex. pullets	42	43	43	41	

CHEESE.

Trading in cheese was about normal this week, with a fair demand reported. Y. A. closed a half-cent up. Fancy flats advanced a half-cent during the week but did not hold this figure at the close. The records show 970,725 pounds of cheese in the local cold storage.

Fancy California flats, per lb.	.28 1/4c
do, Firsts	.27c
California Y. A., fancy	.31 1/2c
Oregon Y. A.	.33 1/4c
Oregon Triplets	.34c
Monterey cheese	.22 1/2 @ 24c

FRESH FRUITS.

The market is quiet and shows the effect of the holidays and also of the efforts of many people in helping San Francisco go dry. Cherries are getting near the end of their season, and the prices are stiffening in consequence. The Imperial cantaloupe season is also approaching a close and prices have advanced. Berries were somewhat weaker and a material reduction was made in the price of blackberries. Figs continue to decline in price and are now at their lowest. Grapes are beginning to come in. Malagas sold at \$2 to \$2.50 per Los Angeles lug, and seeders at \$2.50 to \$3 per box of 25 pounds.

California apples	\$3.00 @ 4.00
Northwest apples	3.00 @ 4.00
Peaches	.40 @ .75
Apricots	\$1.00 @ 1.50
Plums	1.25 @ 1.75
Figs	.50 @ .65c
Strawberries, chest	\$1.00 @ 1.40
Raspberries	12.00 @ 14.00
Loganberries	7.00 @ 10.00
Blackberries	7.00 @ 9.00
Currents, chest	10.00 @ 13.00
Gooseberries	.8 @ 10c

Cherries—	
Royal Anne	.10 @ 12c
Black, bulk	.10 @ 15c
White, bulk	.6 @ 8c
Cantaloupe, Standards	\$2.50 @ 3.00
do, Ponies	2.25 @ 2.75
do, flats	1.25 @ 1.50
Watermelon, lb	.2 @ 2 1/4c

CITRUS FRUITS.

Oranges and grapefruit were slightly lower this week, but there was no change in lemons, which continue to be in excellent demand. Oranges, Valencia \$3.50 @ 5.00
Lemons, fancy \$6.50 @ 7.00
do, choice 5.50 @ 6.50
do, standard 4.50 @ 5.50
Lemonettes 3.50 @ 4.50
Grapefruit 3.50 @ 4.25

DRIED FRUITS.

Prunes jumped from a half to two cents this week, and pears advanced a cent. Buying continues to be steady and some of the growers are inclined to hold out for still higher prices. This attitude is generally discouraged, and it is believed that prices have about reached the limit, especially for domestic consumption, and it is doubtful if the export trade will continue to pay any more increases in price.

Apples	.17 1/4 @ 18c
Pears	.18 @ 20c
Peaches	.14 1/2 @ 15c
Apricots	.23 @ 25c
Prunes	.13 @ 15c
Figs, Adriatic	.14 @ 18c
do, Calimyrna	.15 @ 20c

RICE.

Rice generally is very firm. With practically no paddy available it is reported that as high as \$7 has been bid in some instances. Fancy Japanese has sold as high as \$12 during the past week, but if these prices had brought out any considerable amount there is no doubt that they would have receded at once.

HONEY.

None of the present crop of honey is coming into this market and the local market may be said to be wholly inactive. The quotations below are those established by the Honey Association, but it cannot be learned

that any San Francisco dealer is buying at these figures.

Water White, Orange Blossom.....18c
White to Water White, sage (Subject to production).....17c
Light Amber Mountain (Sage-Buckwheat) 14c
Light Amber Alfalfa.....11c

LOS ANGELES.

Los Angeles, June 30, 1919.

BUTTER.

This market shows a further decline in price since last week. Price advanced 1c on the 27th and on the 30th dropped to 55c. Receipts are lighter than for sometime but demand continues good. Receipts for the week, 325,300 lbs.

California extra creamery.....55c
do, prime first.....53c
do, first.....52c

EGGS.

The egg market advanced again since reported last week. Receipts are lighter but the demand is holding up well. Receipts for the week, 1,350 cases.

We quote:

Fresh ranch, extra.....51c
do, case count.....50c
do, pullets.....44c

FRUIT

Cherries in fair demand and quoted higher. Raspberries and Loganberries reported lower and selling very well. Plums slow sale. Receipts continue good.

We quote from growers:

Cherries, lb.....13@16c
Gooseberries, lb.....10@11c
Apricots, lb.....3@5c
Strawberries—
30 basket crates, fancy.....\$4.00@4.50

do, No. 1.....20.00@22.00
do, Standard.....18.00@19.00

Special Deciduous Market Report

(Written for Pacific Rural Press by J. L. Nagle.)

Sacramento, July 1, 1919.

The settlement of the New York teamsters' strike forestalled what otherwise might have resulted in heavy losses to the fruit interests of California.

A few shipments of Bartlett Pears have been made from the Sacramento River and we look for the heavy movement to commence next week. The quality is exceptionally good, and we anticipate a firm demand throughout the season. The canners are very active, but we believe there will be practically as many Bartletts shipped East this year as there were last year.

Texas and Oklahoma Peaches not only are arriving in larger quantity, but the condition of this fruit is weak, which has a tendency to lower the market.

The plum market remains steady and as the crop is short, we believe that there will be a firm demand for this variety, for the balance of the season.

Shipments of Thompson Seedless Grapes are now moving from the Imperial Valley, and if the quality is good and the berries have the required sugar content, we anticipate an exceptionally strong market.

Averages for the week:

NEW YORK—Tartarian Cherries, \$1.80; Bings, \$2.57; Royal Anne Cherries, \$2.67; Republicans, \$2.30; Formosa Plums, \$3.36; Beauty, \$3.11; do, lugs, \$4.00; Climax, \$3.35; Clyman, \$2.37; Comet Pears, H-B, \$3.05; Peach Apricots, \$2.45; Royal Apricots, \$2.29; do, lugs, \$2.75; Moorpark, \$2.10.

CHICAGO—Formosa Plums, \$2.50; Climax, \$2.20; Santa Rosa, \$2.40; Shiro, \$1.95; Burbank, \$2.07; Tragedy, \$2.69; Clyman, \$1.59; Beauty, \$2.09; Botan, \$1.25; June, \$1.85; Royal Apricots, \$2.18; Peach Apricots, \$1.55; Triumph Peaches, \$1.27; Alexanders, \$1.06; Republican Cherries, \$1.65; Bings, \$2.14; Royal Annes, \$2.35; Wilder Pears, H-B, \$2.80.

BOSTON—Beauty Plums, \$2.80; Clyman, \$1.96; Formosa, \$3.20; Climax, \$2.66; Santa Rosa, \$3.15; Burbank, \$2.05; Shiro, \$1.95; Red June, \$1.65; Tragedy, \$3.60; Maynard, \$2.65; Alexander Peaches, \$1.24; Royal Apricots, \$1.73; do, lugs, \$2.25; Moorpark, \$1.37; French Apricots, \$2.30; Oregon Cherries, \$2.38; do, lugs, \$2.95; Lamberts, \$2.25; Tartarians, \$2.37; Royal Annes, \$2.56; Republicans, \$2.42; Bings, \$2.68.

do, 250 to 300.....18c
do, 300 to 400.....17½c

Los Angeles, July 1, 1919.

CATTLE.

This market still lower since reported a week ago. The offerings are liberal and the market continues dull.

Per cwt. f. o. b. Los Angeles:

Beef, steers, 1000@1100 lbs. \$9.00@10.50
Prime cows and heifers.....7.50@8.50
Good cows and heifers.....7.00@7.50
Canners.....5.00@5.50

HOGS.

No change noted in this market since last week. The demand is light and prices steady.

Per cwt. f. o. b. Los Angeles:

Heavy average 275 to 350 lbs \$15.50@16.50
Heavy average 225 to 275 lbs 16.50@17.50
Light.....17.50@18.00
Rough docked 20 lbs. piggy sows 40 per cent.

SHEEP.

All quotations the same as last week. Prices are steady and the demand reported fairly good.

Prime wethers.....\$ 8.50@ 9.50
Prime ewes.....8.00@ 8.50
Yearlings.....8.50@ 9.50
Lambs.....12.50@13.50

PORTLAND LIVE STOCK

Portland, Ore., June 30, 1919.

CATTLE—Lower: receipts, 1931. Steers, best, \$10@10.50; good to choice, \$9@10; medium to good, \$8.50@9; fair to good, \$7.75@8.25; common to fair, \$7@7.50; good to choice cows and heifers, \$8@8.50; medium to good, \$7½@7.75; fair to medium, \$4.50@5.50; canners, \$3@4; bulls, \$5@7.50; calves, \$9@13.

A BIG VOLUME

Last week's issue completed the 47th volume of the Pacific Rural Press, which has seemed to us to be the best of any of its predecessors. We think the contents of the paper during those six months were more valuable as well as more newsy than ever before, and the subscribers evidently agree, as never before have we received so many new unsolicited subscriptions, or had so few discontinuances. Certainly the volume was larger—it contained a total of 984 pages—160 more pages than the largest previous volume. In point of business carried, it was also a record breaker. During the six months we printed 2203 columns of paid advertising as against 1929 columns for the same time by our nearest competitor. During the past six months this journal contained 984 pages, and its nearest competitor printed a total of 822 pages. The Pacific Rural Press is California's oldest, largest, and best farm journal.

We ask the continued patience of those anxiously awaiting the new edition of "California Fruits." Prof. Wickson is devoting all of his time these days to editing the Rural Press and revising the next edition of his book. Preparations are now about complete to reprint the eighth edition of "California Fruits," which we hope to have ready by September 15th.

HOGS—Higher, record prices equalled and further rise looked for. Receipts, 1806. Prime mixed, \$20.25@20.75; medium, \$19.50@20; rough heavies, \$18.75@19.25; pigs, \$18@18.50.

SHEEP—Steady, receipts 254. Prime lambs, \$11.50@13.50; fair to medium, \$9@10; yearlings, \$6@9; wethers, \$7@8.50; ewes, \$6@8.

EASTERN.

Chicago, June 30, 1919.

HOGS—Receipts, 56,000; estimated tomorrow 37,000; closed strong, but 15c to 25c lower than Saturday. Bulk, \$20.00@21.35; heavyweight, \$20.85@21.25; medium weight, \$20.50@21.40; light weight, \$20.60@21.40; light light, \$18.75@21.00; heavy packing sows, smooth, \$20.00@20.60; packing sows, rough, \$19.00@19.85; pigs, \$17.50@18.75.

CATTLE—Receipts, 22,000; estimated tomorrow, 13,000; weak. Beef steers, medium and heavyweight, choice and prime, \$14.50@15.50; medium and good, \$12.35@14.60; common, \$11@12.40; light weight, good and choice, \$13.40@15; common and medium, \$10@13.50. Butcher cattle, steers, \$7.75@13.50; cows, \$7.40½@12.25; canners and cutters \$6@7; veal calves light and handy weight, \$17.25@18.25; feeder steers, \$9.25½@12.75; stocker steers, \$8@12.

SHEEP—Receipts, 22,000; estimated tomorrow, 13,000; unsettled; lambs, 84 pounds down, \$15@17.50; culls and common \$8.50@14.50; yearling wethers, \$10.25@14; ewes, medium, good and choice, \$6.50@8.75; culls and common, \$2.50@6.

\$125,000,000 FRUIT CONCERN.

The organization of the American Fruit Growers Inc., is announced at Washington, D. C.—a \$125,000,000 corporation for the growing and distribution of fruit. Chas. J. Brand, Chief of the Bureau of Markets of the Dept. of Agriculture has resigned to head the new concern. The company has already bought fruit growing properties in Wenatchee and Yakima Valleys of Washington, in the Corona citrus belt and the Lodi grape region of California; the apple regions of the Appalachians and in Southern Illinois; the peach regions of Arkansas and some of the citrus sections of Florida.

COTTON FORECAST AT 10,986,000 BALES.

At Washington, July 1, Cotton production this year was forecast at 10,986,000 equivalent of Agriculture, basing its estimate on the June 25 condition of the growing crop, which was 70.0 per cent of a normal, and an area of 3,960,000 acres under cultivation on that date.

The acreage and condition on June 25 for California was 169,000 and 99.

HOGS SELL AT HIGHEST KNOWN PRICE.

At Chicago, July 1st, hogs sold for \$21.75 per hundred weight. The previous top record was last year \$19.40. The strength in the hog market was ascribed chiefly to export demand for packing house products. Before the United States entered the great war \$10.25 was the acme for hogs in July.

Classified Advertisements

WANTED—Married dairyman; experienced in feeding, testing, calf-raising, use of milking machines, gas engines, etc. Sunnybrook Ranch, Willits, Calif.

WANTED—Married ranch foreman, experienced in deciduous orchards and general farming. Give references. E. D. Farrow, West Oak St., Visalia.

COUNTRY LANDS.

\$35,000—85 acres, 50 yards from school; county road on two sides. 10 room house (hot and cold water), 3 wells, windmill and tank, new gas engine and pump; barn, chicken and brooder houses; 2 horses, 1 cow, 350 chickens; 300 fruit boxes, 200 trays; complete set of implements to run place, including 4 wagons, \$250 power spray pump, cider press, etc.; garage and work shop. Average income \$5,000 per annum. Will guarantee \$7,000 crop this year. 2 miles from Windsor station between Santa Rosa and Healdsburg, Sonoma county. 30 acres prunes, of which 18 acres bearing, balance 3 to 5 years; 1 acre peaches; 10 acres apples; 2 acres pears; 14 acres resistant vines; plenty of berries, beans, corn, potatoes, etc. About 30 acres of this is deep, rich bottom land with plenty of water to irrigate, if necessary. Mortgage, \$12,000 5%, can remain. Umben, Kerner & Eisert, 20 Montgomery St., San Francisco.

334-acre State Road.
Middle West Farm, \$5000.
Splendid 10-room residence, steam heat, improvements, house alone estimated worth \$7000, large barns, etc., near bustling railroad town and only 8 miles large city. Productive loam tillage, stream-watered 50-cow pasture, wood, timber, apple orchard. Borders beautiful river, motor bus passes door. To settle now, low price \$5000 gets all; only \$1500 down, easy terms. Details page 78 Catalogue bargains 1919 States, copy free. STROUT FARM AGENCY, 831 A. F., N. Y. Life Bldg., Kansas City.

\$16,000.00—80 acres on Honey Lake Valley, Lassen county. All under cultivation. Alfalfa seed, hay, and grain; under good irrigation system. Good improvements. 2 miles from postoffice and bank. School, 1½ mile; high school, 15 miles; S. P. depot, 3 miles. Daily trains. A good buy. Cash only. Have other business prospects. Write to Box 280, Standish, Lassen Co., Cal.

FOR SALE—10 acres of fine land, containing a well-equipped chicken hatchery. Good house and improvements. 7 acres in young prune trees. For particulars, inquire of Box 693, Hollister.

ELLIOTT-BRANT RANCHO
 Breeders of Registered Guernsey Cattle,
 D. O. Brant, Manager Dairy Dept.
 Owensmouth, Cal., Oct. 22, 1918.
EMPIRE CREAM SEPARATOR COMPANY,
 Denver, Colorado.

Gentlemen: We have been using our "Empire" Milker for five months and you may be interested in the results we have had with it.

It has been a great aid to the labor problem during these war times when all labor and especially hand milkers are very unreliable. All our cows are registered and half the milking herd are on official test. Being milked three times a day, which practice we have found gives us about a 20 per cent increase in production. Two men with three single units milk 50 cows three times a day and 20 more cows twice a day, weigh their milk and record it and take care of their machine with great ease. Two men could not do this amount of milking and stick at it long, by hand.

But there is something more than just the amount of work they can do with the machines, it takes away their work easier and more pleasant. It takes away their "I've got you where I want you" attitude and it removes that constant worry that all cow owners experience—the fear of being left in the lurch, for any one of a number of men about the dairy can operate the machines on a minute's notice. The same man is a better man with the machine.

If the machine is carefully washed each time it is used and the pail sterilized in steam and the rubber parts kept in chlorinated water, milk with very low bacteria count is produced and it contains much less stable dirt.

As for production, we have found that heifers milking for the first time, take readily to the machine and there is some evidence that they do even better than they would by hand, probably because they do not have to go through a change in the style of milking and because short teats do not matter. Heavy producers take to the machine with less drop in their production than other cows that are not producing heavily. Our cows took very readily to the machine on the whole but some were slow. The machines will operate satisfactorily if the man operating them will make them.

(Signed) D. O. BRANT.

"A Great Aid to the Labor Problem"

—so says D. O. Brant, manager of the Dairy Department of the Elliott-Brant Rancho, the well-known breeders of Registered Guernsey Cattle (see letter on right). Their 70 cows are handled by two men, and 50 of these 70 cows are milked three times a day instead of twice! It simply couldn't be done regularly by two men by hand milking.

Again, the Elliott-Brant people, in contest with winners from the National Dairy Show, were awarded the highest score ever given any milk or cream in this country at the recent milk test conducted by Government Officials at the Liberty Fair at Los Angeles, Cal. The Empire Milking Machine is without question a big help in the production of high-grade milk, since contact with stable air and dust is eliminated—the milk flows directly from the teats to the air-proof milker pails. Decide now to get better, cleaner milk and to cut the cost of producing it. Write for our catalog No. 45 or see the nearest Empire dealer.

The above is just one out of hundreds of letters endorsing the EMPIRE MILKING MACHINE

The EMPIRE Double Unit Milking Machine.
 Also in Single Units.

California State Lib 71-23

Wanted--More Milk-Fed Americans.

Written for Pacific Rural Press by R. H. Whitten.

OO LONG HAVE WE CLASSED MILK as a beverage, butter as a lubricant, cheese as a condiment, and ice cream as a confection. It is time for the public to understand the value of the dairy cow and learn to think of her as a producer of real foods of the most vital importance.

That was the Big Idea expressed at the first annual meeting of the California Dairy Council, held in San Francisco last Tuesday and Wednesday. The Council was organized several months ago and the veteran creamery man and dairy farmer, Sam H. Greene, was made manager. Since then Mr. Greene has been quietly conducting a membership campaign, and the movement has received such enthusiastic support that the time for putting across the Big Idea has arrived.

So an interesting program was prepared for this meeting, and the speakers included Dean Thos. F. Hunt of the College of Agriculture; Prof. H. E. Van Norman of the University Farm; Dr. Wm. C. Hassler, San Francisco Health Officer; Wm. T. Boyce of the U. S. Department of Labor; Senator E. S. Rigdon, Hon. Frank J. Cummings, and other authorities closely connected with various phases of the dairy industry.

For it must be understood that this Council is not an organization of dairymen alone. Included among its active members are purebred breeders, commercial dairymen, manufacturers of butter, cheese, ice cream and condensed milk, retail distributors, dealers of dairy

produce, machinery and equipment, millers and bankers. And among the associate members are educators, health officers, officials of women's clubs, civic bodies, labor organizations, and retail food distributors. For are not all of these individuals interested in dairy products somewhere along the line from producer to consumer?

The Council is not a producing, manufacturing, or selling organization. Its work is purely educational and legislative. It does not compete with any existing organizations, but instead includes all of them in its membership and works for the good of all. Its work is conducted along three main lines: first, educating the public to the food value of dairy products and increasing their consumption; second, helping the dairyman to increase production, reduce expenses and enlarge his profits; third, providing a common meeting ground, or forum, where all the different interests dependent upon the dairy cow or benefited by the use of her products may meet together, air their grievances and adjust their differences.

A Nation-Wide Movement.

This is not a new, untried scheme. The California Dairy Council is affil-

iated with the National Dairy Council, which was organized in Chicago November 5, 1915. There are a large number of State councils and most excellent work has already been done by many of them. In Des Moines, at end of the first week of an advertising campaign, the dairies reported increases of from 7 to 20 per cent in the amount of milk sold, and the consumption of cottage cheese increased over 500 per cent. In Minneapolis the campaign was carried right to the schools, and 50,000 children were shown the relative comparisons of dairy products and other foods. The parents' and teachers' associations were included; exhibits were placed in department store windows; posters were hung in conspicuous places, and educational films were shown in 125 moving-picture houses. In Milwaukee a practical comparison was made of children receiving plenty of milk and those having very little or none, and the former were found to be in much

better physical and mental condition. In Detroit a campaign increased the consumption of milk 20 per cent and buttermilk 50 per cent. In Seattle a "Dairy Day" was held, which resulted in an increased consumption of dairy products, and later on the school authorities arranged to supply milk to pupils who needed it. Wonderful results followed. Restless pupils became quiet; there was increased attention to their studies; and at the clinics it developed that they were building up physically.

The Start in California.

At the recent meeting of the California Dairy Council plans

for the coming months were outlined, and very soon a campaign will be started similar to those which have proved so successful in other States. Capital will be made of the knowledge that has recently been brought to light by Dr. E. V. McCollum and others regarding the food value of milk, and it will be persistently kept before the public through all available channels of publicity. Dr. McCollum has found that dairy products contain a vitamine which is absolutely necessary to the proper maintenance of human life, and that persons when deprived of it become weak, torpid and prone to disease. He has found, too, that milk is one of the best all-around foods for adults as well as children.

The movement to increase the consumption of dairy products has begun and the work will be done, just as successfully as it was done by the citrus people in increasing the per capita consumption of oranges 71 per cent in ten years with only a 21 per cent increase in population. When the plans outlined at the recent conference are put through the value of dairy products will be so raised in the estimation of the people that they will consume them liberally, and will pay a price which will give the dairymen a sufficient margin of profit.

The cow is a most wonderful laboratory. She takes the grasses of the pasture and the roughage of the field and converts them into a most perfect food for man. In that food there is a mysterious something which scientists have found essential to the highest health of the human race, and which can be found nowhere else. Men have sought the fabled Fountain of Youth for centuries. The nearest approach to it is the udder of the cow. Without her products children languish, the vigor of the adult declines, and the vitality of the human race runs low.—Frank O. Lowden, Governor of Illinois.

EDITORIAL.

EDITORIAL PRIVILEGE.

We desire to inform our readers briefly of the work of a facile liar, who is now infesting the California countryside in the interest of a rival journal. We are informed by several subscribers that this slick slanderer is manifesting particular interest in our personal career and freely sharing with the public his ideas of our achievements. Sometimes he merely mournfully pictured us as being now retired to well-earned seclusion, while a bunch of play-writers has been secured by the publisher to keep this journal going. Sometimes—

"The big round tears

Coursed one another down his innocent nose
In piteous chase."

—as he reported us dead and sobbed some comfort from the retention of our name at the head of the editorial columns as a fitting decoration of our tomb! These and other slanders concerning the re-issue of our horticultural books are being circulated by this glib calumniator to rob this journal of its good name and to divert from it the increasing patronage and support which are now naturally flowing to it as the recognition of nearly half a century of service in the promotion of California farmers and farming interests. It is very coarse lying, because it is common experience that an institution like the Pacific Rural Press will continue and will grow in popularity because of the value of the work it is doing and no misrepresentation can prevail against it. So far as our personal connection with this work is concerned, it is very silly lying, because everyone knows that the onward course of an efficient public journal is not dependent upon the limitations of any individual. Still, as this freak falsifier seems to think that he can get away with some swag by lying about this writer, we desire to state frankly that we have never before done as much work for these columns as we are doing now, nor have we ever had such keen delight and satisfaction in doing it. And while, of course, we know no more than any other man knows, how soon we may have use for a monument and an inscription, the prospect clearly is that we shall be gaily carrying on with this popular endeavor long after the moral pervert who is slandering us enters into his rest in some county jail. We claim the privilege of asking our readers to take note of his performances and help protect the people from being imposed upon by them.

E. J. Wickson

THE PREENING OF THE PRUNE.

AS WE glided along the tessellated aisle of our favorite cafeteria the other morning and were just beginning to wireless to our willing heart the glad welcome which suffused the faces of the dispensing damsels behind the rows of overflowing trenchers, we happened to catch the burning gaze of the particularly queenly wielder of the mush-ladle—which, of course, caused our glance to fall modestly and enquiringly. As our vision sank from the conflagration aforesaid, we started with a thrill as our new line of sight pierced this price-card:

PRUNES, 10 CENTS

And there they surely were: five stewed prunes of the 60-70 variety nearly submerged in a sea of gory goo, offered to the public at this exalted rate, while saucers of apple-sauce and other pomological slumgullions were priced at 6 cents, and whole bananas, halves of orange and grapefruit, and slices of pineapple were also available at the lower figure! Our delight in our attractive environment was forgotten: all our senses and our discriminating judgment ceased to act as we stood in wrapt adoration of the exalted prune! Here was an organism, once held common and lowly, pinnacled above all the fruity host! Here were five small plums such as grow in our backyard and are easily cured in the sun on the roof of our henhouse, out-valuing all the other fruits—even those which come from beyond the seas and have braved all Maskewian terrors in their approach. It seemed beyond credence that the prune, after serving so long as the symbol of dietary monotony and ineptitude, that nice but rather naughty Mary Pickford, when impersonating a foundling in an orphanage could only describe her life as "just one darn long prune," should have attained such cafeterial queenship of all the fruits. And yet, so it was: the day of the prune has dawned, or, as we may say, the prune has turned!

THE USES OF ADVERSITY.

"Sweet are the uses of adversity," sang the Bard of Avon—and obviously thus they should be when adversity strikes a cured prune, which is often more than one-half sugar. But sweeter far than the millions of pounds of saccharine substances which the depression of prune prices made widely available for the nourishment and medication of the world, were the uses of adversity which made prune producers conscious of the fact that they had attained to the achievement of a great industry, and that it was up to them to be more than pickers, prickers, dippers and spreaders of plums with which packers and jobbers waxed wealthy while they themselves, though actual producers of the wealth, fared worse than hirelings. It was adversity indeed and it required more than two decades of consecutive, though not well-connected, co-operative efforts to escape from the clouds of it. However, the day of fair returns to producers dawned upon the crop of 1915, through the efforts of the Prune Growers' Committee, and full day followed in the achievements of the Prune and Apricot Growers' Association. In this way the uses of adversity became sweet—for it was the very hardness of the yoke of commercial bondage which nerved the prune producers to throw it off. And it happened to have been done just at the most opportune moment, for through the work of the Association the upward course of prices, which war demands caused, yielded its net returns to the growers of prunes and not to the gamblers therein. It would be difficult to over-draw the hardships which the war would have brought to producers had it not been for their co-operative organization. In 1915 it saved them from a slump which dealers declared the exclusion from the European markets would inevitably occasion. In the three following years producers would probably have netted only pitifully because between the increasing cost of labor and supplies and the unyielding pressure of the packers to secure the crop, the growers would have gone through three crop years as limp overalls emerge from the mangle of a steam laundry—with gaping fundaments and pockets full of buttons. Quite in contrast has been the joyous, whole-seated prune-grower since he learned to do his own selling as well as producing. The whole aspect of the Santa Clara valley has taken on new colors—as, perhaps, the map of Europe will assume them under the beneficent application of the league of nations covenant! The producers are learning to defend themselves against autocratic rule from both below and above. New light and life are to be discerned all through the countryside. It is confidently believed that if the observers on Mt. Hamilton will train their instruments downward they will discover many more shooting stars on the floor of the valley below, as the headlights of the prosperous prune growers flash their beams through the tree-bordered, rural highways, than they can

describ in the midnight skies above them. And if the astronomers above will listen as well as look they will also become aware that the tinkle of the tin-lizzies, in which the growers fly from the movie-palaces of San Jose to their orchard homes, actually fills the whole valley with melody more cheering and humanly comprehensible than the music of the spheres. "Sweet are the uses of adversity"—but one must learn how to use it!

WHAT ADVERSITY DID FOR PRUNES.

Prune growers were at the bottom of their adversity in 1900. The more prunes a man had on his trees the worse off he was because he was tempted to pay out money to gather and cure them, which he never could recover. We remember listening to a man who had done it and we tried to change the current of his gloom by asking if he could not do better with the large sizes at least. "Oh, yes," he said, "I like the large sizes a little better. In this delightful fall weather I am sleeping out in the yard and I keep a box of large prunes near the head of my cot. The cats bother me some with their moonlight sonatas and I can throw a big prune straighter than a small one. Yes, on the whole, the big ones do a little better for me."

It was a slough of adversity, and yet—have you ever studied a mudhole at a point where a newly cut roadway has hit upon a little spring: how the traffic churns the dirt into a bog which all moving things skirt around if possible. Have you noticed how there will seem to be a little thrill in the water at some point, and perhaps a few bubbles rising to the surface? And have you watched until there came at that point a clearing in the the water through which you could see the spring discharging now and then its pure contents and constantly widening its sphere of influence until if no disturbance intervenes, the mudhole becomes a crystal pond? It was adversity which sent the plow-point into the natural channel through which a little trickle of water was pushing along beneath the surface. It was a use of adversity which sweetened the pond and disclosed an opportunity for later work to lead the water to serve some beneficent wayside purpose.

It was the adversity of 1900 which pointed out the way to the prosperity beginning with the achievement by the Prune Growers' Committee of 1915. It was not a revelation of purpose or of method; they were born to the small local co-operations which preceded the disaster of nineteen years ago. It was not a demonstration of success, for the outcome of the effort of 1900 was at the time a calamity and was followed by a decade and a half of discouragement and depression. The adversity of that year was crushing, but the last uses of it were sweet.

THE PERILS OF PROSPERITY.

So far as we can now remember, no poet has ever found any candy in the uses of prosperity. Both poets and preachers seem to regard them as dangers and menaces to the soul—even though they do describe them sometimes as possible joys to the mind and body of a man. Prosperity seems to have about the same relations to prunes. When there are so many prunes in sight and so few orders for them that packers do not think it worth while to call a grower by his front name, the growers go off by themselves and do something for themselves. When there are few prunes visible and many orders for them, the packers go after them with racing super-sixes and the growers, who the previous year denounced all packers as land-pirates, are apt to be swinging on their gates as they approach, with fingertips pointing to their lips—like merry maidens waiting to be wooed. Such are the perils of prosperity. Growers who fore-sware the packers when prices pinched are apt to forget their oaths and signatures when buyers offer them fractions above whatever price their association shall fix and allow themselves to be tempted to break their agreements and to be led captive as Timothy describes it, like "silly women laden with sins, led away with divers lusts."

Such are the weaknesses of mankind that adversity draws ordinary men of similar sufferings and necessities together and prosperity spreads them apart—even though it was united action born of

adversity which created the prosperity. It is not that way with deep-thinking, resolute men, for when they unite to secure prosperity for themselves the attainment of it binds them more closely together—until the courts are invoked to unscramble them. All our co-operative marketing associations have in some form or other encountered the disintegrating tendency of their own successes. This is because all co-operations include many people who do not think or see deeply, and therefore do not discern that the currents of trade may be under-cutting the abutments on the prosperity bank of the very bridge which carried them over to it. Fortunately, this weakness of the flesh has not been able to undermine the spirit of our great agricultural co-operations so that disaster has befallen them, but such weakness has always limited their operations and successes, and resolute effort has always been necessary to safeguard their own victories and to prevent the irresolute from yielding to temptations which, if freely indulged in, would plunge their whole outfits into the stream of disorganization and cause their industries to cantilever again from the adversity side.

THE PRUNE MUST REACH NEW OBJECTIVES.

The California prune interest is great, productive and widespread throughout the State. The beautiful Santa Clara valley, in which it was first domiciled and which now supplies more than half its production, will not be in the future so preponderatingly its habitation and warehouse—if prune-growers maintain the mastery of its trade as they have during the last five years. In fact the prune industry promises to encompass all the valleys of the State, both coast and interior, and to be larger and more wide-spread than any other fruit specialty of California. It can successfully use lands which many other fruits refuse and at the same time profitably use lands which delight most of them. It has advantages over most other fruits in greater ease and economy in the protection and promotion of the tree and in the gathering and preparation of its product, and it has wider scope and opportunity in the marketing thereof. It has only one rival in the ambition to world-recognition as a staple food—and that is the raisin, which can claim no such breadth of adaptation to local producing conditions of soil and climate. It is therefore in a glorious pomological and industrial sense that it may ere long appear to the outside world that California is "just one darn long prune"!

For the attainment of these objectives it is indispensable that the State at large consider the prune as its own affair, and lend its full influence to the promotion of its production and the prosperity of its producers and the prevention of the perils which that very prosperity seems to invite. We recently cited, in the columns devoted to the fruit interests, the fact that the directors of the Prune and Apricot Growers' Association had announced that to continue its successful work and to enforce its option to handle the crops of 1920 and 1921, it must be entrusted with a greater proportion of those coming crops than it now has signed up. This does not mean that its support is actually less than it has been. The courts will render that impossible. But it will be relatively less; that is, it will have a less percentage of the whole crop because so large an acreage of trees too young to be signed up in 1917, is coming into bearing. The planting of prunes has been very large during the last few years; planters have fairly looted the nurseries of prune trees. Trees which will be bearing during the two years following 1919 should be signed up this year. New growers should understand that the fact that they are now glad that they have such trees rests directly upon the other fact that packers are now the servants of the industry, as they should be, and not masters of it. Old growers who have unsigned trees coming on and may think it will be fun to have the fruit from such trees to gamble with, while the Association sees to it that the wheel is flung fairly, should realize that such gambling is an industrial crime, because indulgence in it may turn them back to throwing the packers' loaded dice on a curing tray—just as they did in the days of their adversity. It has been the for-

tunate experience of other California co-operative selling that each time they have renewed contracts they have covered a greater percentage of the product. This is what the Prune Association should be enabled to do through new and extended memberships. Prune-selling is not likely to be always as joyful as it has been during the last two years and only competent growers' control of increasing amounts of coming crops can make it as joyful as it can be. There will be plenty of time for thought and discussion of this matter, but when the Association announces what increased acreage it will require to be signed up before it will proceed to take up its two years' option following this year's crop, every grower ought to be ready to exercise his judgment on the proposition. The crowd is getting too large to be covered by the old umbrella. If a good stiff-ribbed canopy is not provided by larger co-operation it is quite possible that in the driving storms, which must be reasonably expected, a good many growers may awaken to find their coat-tails wet!

QUERIES AND REPLIES

By the Editor.
Inquirer Must Give Full Name and Address.

Wrong at the Root.

To the Editor: I have a Santa Rosa Beauty plums three years old. The plums are beginning to ripen. I noticed the leaves beginning to wilt and I dug down around the roots and found they are diseased. I am sending you a twig. Please tell me what the trouble is and what can I do for it?—Novato.

The twigs only show that they have not been properly supplied with sap to make good growth and that the foliage is now wilting and the fruit shriveling for the same reason. The trouble has probably existed since the tree was planted, for last year's growth was slim and scant and this year's has only poor leaves and failing fruit. Something in the soil is wrong and has been for some time. It may be that there is too much saline matter or that standing water in the winter has caused root rot, although the soil may now be too dry. It looks either as though the soil is inhospitable to fruit trees or the root upon which the tree was worked in the nursery is not adapted to conditions which perhaps other roots might endure.

Currant Troubles.

To the Editor: I am sending some leaves and currants to see if you can tell me what to do for them. They are infested with a small green bug that takes them every year.—E. V. S., Merrillville.

The small green bug which you mention is an aphid or plant louse. It can be killed by spraying as soon as you see the first of them early in the spring—using soap and tobacco wash with a sprayer which can be shot against the under sides of the leaves. The treatment must be repeated to kill later hatchings in a week or ten days. Your leaves show also mildew, which is checked by sulphuring as soon as seen. The berries show the work of the currant fruit-fly which lays eggs in the fruit which hatch into grubs feeding inside the berry. This is a very hard pest to overcome. These flies rise from the ground where they emerge from pupae which remain in the soil through the winter. The pupae are destroyed or exposed by cultivation. To dig up the ground several times during the winter or early spring and allow the fowls to work it over will largely reduce the numbers of flies and their injury to the fruit.

Blemishes on Rose Leaves.

To the Editor: I am enclosing leaves taken from my rose bushes. Can you advise me what this blight is and what to do for it? I have tried sulphur but without results.—A. M. R., Chico.

The leaves show signs of mildew, which causes discolorations of grayish hues over considerable areas of the leaf. This trouble seems, however, to have been checked by your sulphuring or by the increasing heat and dryness of the summer air. There are also black blemishes on other leaves which are quite definite but of irregular outline. The two occurrences have no clear relation to each other. These black blemishes affect but one side of the leaf and do not penetrate the tissue so as to affect the other side at all. They are not recognizable as signs of any fungus blight or insect at-

WHAT ARE YOU DOING?

We have a number of men who are doing excellent work in our circulation department, looking after our renewals and securing new subscribers. They enjoy the work and are making good money.

We can use a few more men, and if you are not satisfied with your present work and feel that you can earn more money, perhaps we have just what you are looking for. Anyway, it won't do any harm to investigate.

So if you have an automobile and are free to travel; if you are not afraid of hard work, and believe that you can successfully present our paper to the people, write us about yourself and we will give you full particulars.

tack, and are probably only local and negligible though they have a very threatening appearance. Keep the bushes well watered and manured so they can make plenty of other leaves to serve growth purposes.

Figs, Peaches and Peas.

To the Editor: I am thinking about setting out either peach or figs the coming season and would like to have your opinion, and how far trees should be apart. I would like to raise peas for seed between the trees. What is the best variety to use, the proper time to plant, and how? This place can be irrigated.—A. F. K., Ripon.

We would not plant fig trees nearer than 32 feet, and unless we were very sure whether we wanted peaches or figs we would be tempted to plant both at 20 feet distances—alternating the rows both ways so that we could take out the peaches later and have the figs at 40 feet. The common field pea will do well if planted in the fall as soon as the soil is deeply wet. Plant in drills 2½ feet apart for horse cultivation. If you wish to try garden peas for seed get a contract with a wholesale seed dealer and plant the kind he wishes to buy.

A Mole in a Berry Row.

To the Editor: Is there any method of getting rid of moles at the roots of raspberries? They seem to travel from one end of the row to the other and go back again, as I only have one row, and every time I look the same line is there.—H. F. G., Gardena.

You can get that mole if you will take time and think hard enough—for a man has a larger brain than a mole. You can wait and watch until you see the ground rising as he goes along and throw him out with a spade, or you can buy a mole-trap, press down his gallery gently and set the trap carefully so next time he comes along and lifts up the ground which you pressed down he will set off the trap and get a prod in his back. Or you can spade up the ground along the row deeply and fine the soil loosely so that it will keep falling in on him and he will get tired of trying to make a tunnel in which worms and grubs will gather. A mole does not make a tunnel to get to plants and places as a gopher does. He is setting a trap of his own to catch grubs and does not like to be digging all the time. He does not hurt your plants intentionally. He may lift them up or he may cut off the roots to get the right of way for his tunnel, but he may pay for that by saving other plants from ground insects which he is hunting for. Still, he does dry out plants by allowing too much air to get at the under-soil through his tunnels, and no one likes to see his piles of tailings rising among one's plants or on one's lawn, because it looks like shiftless gardening. But the mole is not easy to get rid of. He knows a few things better than you do, unless you learn them by close watching and hard thinking. When you learn to know them as well as he does, and learn a few other things which he does not know, you have you chance to beat him. A man can do that if he has time and patience enough—for a man has a larger brain than a mole. Besides, the mole is blind! Will you stand it to be robbed of your peace of mind by a blind bur-

Departmental Work in Fruit Growing

(Written for Pacific Rural Press by John J. Fox.)

Order and method are the foundation of success in armies and in any business undertaking, big or little. Without it the small and apparently unimportant details are overlooked, and it is the small details that count. They are like the particles of sand in a concrete block, unimportant taken singly, but in the aggregate they knit the whole mass together and carry the load. Without them the cement would crumble and disintegrate.

The details on a large fruit ranch, such as the Limoneira in Ventura County, which we visited recently, are innumerable and the whole enterprise is run in departments with accredited heads—whether they be actual foremen or leading workmen or specialists. All are responsible to one head who, in turn, is responsible to the company.

The Largest Bearing Lemon Orchard.

The Limoneira Ranch has the largest bearing plantation of lemons in the world—850 acres, half Lisbons

Fertilization of Citrus.

We saw many carloads of baled bean straw bordering the orchards, ready to be carted out and applied as a dressing. J. D. Cuthbertson, the superintendent, said that years when the bean straw has been spoiled by rain it can be bought for from \$3 to \$4 a ton and up to \$10. Manure is laid down at the ranch at \$4 a ton and is applied at the rate of ten tons per year per acre. A cover crop is raised in addition to this. Mr. Cuthbertson said, "I am of opinion that the effect of all this organic matter incorporated with the soil is as beneficial to its physical as to its mechanical condition and plant food value, or, in other words, it assists the trees by providing the best sanitary and assimilating conditions while at the same time it is more responsive to the cultural work of tools. With regard to cover crops, I know that if they are left too late, so as to harden the texture, it frequently retards the spring growth and shows in

A small part of one of the Mexican villages on the Limoneira Ranch. Some of these groups meander along beneath the trees along the bank of a creek.

and half Eurekas, sold under brands that have been in use for 20 years. The soil is a deep, sandy loam with enough clay in it to give good capillarity, but friable and easy to work. It is high in nitrogen and is kept supplied with humus by the application of manure and bean straw and the growing of cover crops. We noticed one young plantation of alternate oranges and lemons with beans planted between the rows. Two years ago the interplanting yielded two tons of beans to the acre and the soil is improved. For irrigation is very regular and the soil moisture kept at as equable a point as possible.

the paler color of the foliage. But leguminous cover crops are most important. I cannot lay too much stress on that."

Nitrogenous Manures.

"We put five pounds of blood to the tree this year on mature trees in addition to the cover crops. With regard to nitrate of soda or sulphate of ammonia two or three pounds to the tree is enough at any one application—we found that out. We gave this block a heavy dose one year and it resulted not only in paling of the foliage but a dying back of the twigs. You can see here how I handled the trees (cutting back) and we have them in good shape again. By giving them no more they gradually came back to their present healthy condition."

Irrigation.

The drainage here is practically perfect and the soil sufficiently fine to retain its moisture satisfactorily. It takes about ten miner's inches a year and the water is applied at intervals of from five to six weeks throughout the season. There is any quantity of water, part from their own watershed, the Sespe and Little Santa Clara Creeks. The gravity system and furrows are used, for the grading was perfected before planting. Tractors and heavy tools do the main of the heavy work in the bottom, and are supplemented with mule teams. An irrigation boss superintends.

Special Work. 230 Acres of Walnuts.

A trained entomologist is kept here to observe and deal with any orchard pests as they appear. He orders the spraying, fumigation and dusting when needed and supervises the operations. He also has a very up-to-date insectary for the breeding of beneficial predatory insects and conducts their distribution in the orchards wherever needed—a responsible department of which he has entire charge. A tree surgeon is also kept

AMERICAN BEAUTY DUST SPRAYERS

To Kill Red Spider

Dust your trees lightly, but thoroughly, with fine dry sulphur; do this four times, with five or six days between dustings. The cost is negligible—less than five cents per tree, and you will save crop losses, and conserve the vigor and vitality of your trees.

Tomato Worm, Flea Beetle, Etc

Dust with Lead Arsenate or Paris Green.

Aphis

Dust with Nicotine Sulphur mixture.

THE HARDIE Fruit Ladders

The superiority of our ladders is based on the solid foundation of right design. HARDIE LADDERS are made of spruce. The war has demonstrated that no lumber can be compared with Oregon spruce in both strength and light weight.

Our manufacturing facilities enable us to make a uniformly good product. Dealers who handle the HARDIE LADDER capture the bulk of the trade. There is a reason. The weight is about 3 lbs. per ft. Price 50c per ft. The Hardie Booklet on request.

BRANCH OF

The Hardie Manufacturing Co.,

Office: 1023 Leighton Ave.,

Los Angeles, Cal.

Held by a Grip of Steel!

Where is the weakest point in every ladder—it's the point where each step is fastened to the stile but that's where the

SECURITY LADDER

is strongest! Each step-end is held to stile by a light steel cuff-bracket which forever eliminates all wobble, and makes the SECURITY strongest where other ladders are WEAKEST!

See your dealer's name in Pacific Rural Press of May 24, page 798. If your town is not listed there we will ship to you freight prepaid on approval two or more ladders at following prices: 8-ft., \$5.00; 10-ft., \$6.00; 12-ft., \$7.20. Pay after you examine and approve shipment.

Please state for what purpose you use the sulphur, quantity needed, and date of shipment preferred.

TELEPHONE KEARNY 871.

tanks are established on an adjacent hill. The oil cars are unloaded into a concrete tank at the railroad siding below (for the S. P. R. R. serves) and thence it is pumped through a mile and a half of pipe to these two big reservoirs. It gravitates back through these delivery pipes to distributing points. These are placed 1,000 feet apart to serve the whole area and the oil is piped to these standards with regulating gates.

Packing and Shipping.

The large packing establishment needed by this ranch was in full swing when we were there. They were shipping three carloads of lemons a day and hope to ship up to one carload to the acre from the whole acreage.

The Labor Department.

The great central group of buildings comprise, in addition to the packing and curing houses, stables, warehouses, office buildings, bungalows and so forth, two large dormitories for the unmarried white men. One contains 36 rooms and another 48, together with baths, washrooms, modern toilets, club rooms, etc. A separate dining room is attached to each place separate from the dormitories. A large amount of Mexican labor has always been employed here. They indeed belong to the soil and are good workers. There are several groups of houses arranged in picturesque colonies in different parts of the ranch, the largest group containing 35 cottages. There are about 170 Mexican laborers' cottages in all and each one has a lot about 40x100 (but varying in size to suit the family), so that they can raise their own garden truck. Each man thus has his own home and privacy yet the companionship that the Latins crave. A neat school stands at a convenient point to accommodate the children. So that it will be seen that the comfort and well-being of all employes is given due thought and consideration. For harmony and contentment are essential to the smooth running of any undertaking. There is no room for the chronic belly-acher or the yawning sun-watcher. It is a pity our new quarantine law could not be extended to exclude this class of insect along with the other pests.

CARNEROS APPLE GROWERS' ASSOCIATION FORMED.

(Written for Pacific Rural Press by C. F. Honeywell.)

The apple growers of Carneros Valley, southwest of Napa, have recently formed a new association for the drying and marketing of their product. N. F. Patterson, the owner of a sizable orchard in this district, is taking the initiative in the perfecting of this association and is constructing a new type of artificial drier on his place, financed by and for the use of the association members. Some 350 acres of bearing apple land are so far included in the new co-operative movement, which comprises most of the apple orchards of that district.

The new drier is a single story building with the floor some six feet above the orchard level. In the center of the building a reinforced concrete pit has been built, six feet deep, four feet wide and ten feet long. Lining this pit are pipes connected to a hot-air furnace established beneath the floor at one end of the pit. Tray racks, lowered and elevated by chains and pulleys hanging from the rafters, lower the loaded trays into the pit. A sulphur box is conveniently located at one end of the drier. The pit, running at full capacity, can accommodate 188 yard square trays at one time. The fruit can be properly dried by leaving it in the pit from five to six hours.

The association has already disposed of its entire crop of Gravensteins to be sold green, at \$2.50 for four-tier boxes, \$2.35 for four and a half tier and \$25 per ton for wind-falls. The apple association of the Sonoma Valley has refused the highest offer made to them of \$2.25 for four and four and a half tier boxes, deciding to ship directly for Eastern consumption, having been guaranteed a 9-day delivery by the railroads.

Anderson Combination Dipper Perforator, Grader And Spreader

Send for Catalog of Packers' and Dryers' Machinery.

PATD. JUNE 6, 1903-OCU. 1905-SEPT. 1906.

A practical machine that the prune growers of Santa Clara Valley (where it is made) and other prune-growing sections have learned to recognize as the standard machine of its kind. It embodies every possible advantage—and does the work perfectly in every way. Durable and substantial in construction.

Wiring Prune Trees to Hold the Crop

(Written for Pacific Rural Press by D. L. Kieffer.)

A. E. Burge of Oakville, Napa County, has for the last two years depended upon a system of permanent wiring of his prune trees to support the fruit-laden branches instead of using scantling props for the purpose. His orchard is one of the show orchards of Napa Valley today, and last year he took 175 tons off 35 acres of seven-year-old trees. Mr. Butler, Napa County Horticultural Commissioner, says the crop in this orchard is 100% this year. Some trees will go 400 pounds or better. This orchard is proving the practicability and advantages of this much-argued system to the prune men of this region. Mr. Burge has 1400 eight-year-old trees on 35 acres wired from branch to branch, using number 14 galvanized iron wire and galvanized staples to anchor the wires to the branches instead of screw-eyes, which he has found do not hold so well and also weaken the branches.

Use Great Care in Wiring.

Good judgment must be used in placing the wires at the center of load on each main branch. The best time to wire is just before the trees lose their natural shape and begin to sag, so that the constant growth of the tree while bearing the load will be toward strengthening it in its normal shape. This point most often is found to be when the tree has on it about one-third of its final load. Great care must be taken to catch the trees just at this point and to avoid binding them too closely, or to allow so much sag that the crotches will strain. Care must also be taken to place the anchorages high on the branches and to divide the load. The trees in this orchard were wired in their sixth year. As they grow larger the wires must be cut every three or four years and an additional section spliced in to allow for the corresponding increase of distance between branches. Also additional wires must be placed when the load on new branches demands it. Only galvanized wiring is used in the tree. In the two years the wires in this orchard have been exposed to the weather, not a spot of rust has been found on them. In other districts where the periods of fog are greater than here, rust will make this system impracticable.

Only one out of every fifty trees needs to be partly propped in addition to the wiring, either because the tree is not of proper conformation to permit wiring fully, or the small branches are too numerous to be properly wired, or because the crotch of some branch is very weak. In such cases one or two props are usually sufficient to hold up these troublesome branches. It has been found impracticable to plant tall posts beside the hole of the tree and support the limbs by wires from it. The unequal pull from various directions so loosens the post that it will lean and allow the heaviest branches to sag beyond the breaking point.

Wiring Cheaper than Propping.

This wiring method is much cheaper than propping and has the advantage of being permanent. Three men can cover four acres a day with 71 six-year prune trees per acre. Paying a man \$5 a day and with wire and

staples 9½ cents a pound—about 5 cents per tree—it costs \$7.50 an acre to wire thoroughly. Ten-foot scantling props of 1x3 at 2 cents a board foot will cost 5 cents apiece and it takes 6 or 7 per tree in this orchard. Not counting the yearly labor costs, it amounts to nearly \$20 per acre to use props. Once the orchard is well wired it is no longer necessary for some one to walk through it once every day to replace props. In this region the wind is continually blowing them down.

HORTICULTURAL JOTTINGS.

Italy's area under vines in 1919 is estimated at 10,724,000 acres.

Prunes in Butte county are sizing up after considerable June drop in some orchards.

The first shipment of Turlock cantaloupes was made the first of July. Shipping is now general from this section.

The Sebastopol (Sonoma county) apple crop is estimated at 750 cars for this season, of which two-thirds will be Gravensteins.

Newell C. Lucas of Ceres (Stanislaus county) has sold the crop on his nine-acre fig orchard for \$3600 on the trees—a cash transaction.

In the Ontario-Cucamonga district, buyers are said to be offering \$30 a ton for wine grapes on the cars as against \$25 paid for the same grapes last year.

The Watsonville district expects to create a new record with her apple crop this year. Such spirited buying of entire crops has never been equalled.

"This year's pears are the cleanest and best quality I have ever seen so far as I can remember," said a pear buyer today. Scabby or wormy fruit is the exception.

George Mead of Chico has an estimated crop of 7000 pounds of nuts on five hundred six-year-old almonds trees. The almond crop in this section is looking full.

Boxes and shook are not likely to be any cheaper and may still soar. Many of the associations are buying at wholesale for their members and furnishing it to them at cost.

California's crop of peaches is estimated to exceed the record crop of 1917 by 10 per cent. About 12 per cent will probably be shipped fresh and the rest goes to the canneries and driers.

The demand for early peaches has strengthened again, with the appearance of Hale's Earlys. Considering the season's yield and the increased acreage in early peaches, the crop has done well. It has to be handled carefully and sold promptly.

In 1918 the strawberry crop of California was estimated at 12,656,600 quarts, of which 54 per cent was used for local consumption, home markets and nearby cities. About 31 per cent was used for the manufacture of preserved products and 15 per cent for distant shipments.

AGRICULTURAL NOTES.

The second sugar beet failure is reported from Stanislaus county, being due this year to the leaf hopper.

The engineering force at the Durham State colony is completing their work of putting the farmsteads into producing condition.

Steps to prevent settlement in the Sacramento and San Joaquin valleys by Japanese, Hindus, and other Orientals, and to preserve the land for settlement by persons of the Caucasian race, are being taken by the Fourteen Counties Association.

The equivalent of practically 11,000,000 bales of cotton, averaging 500 pounds per bale, is the estimate of the U. S. crop made by the Department of Agriculture July 1, basing their figures on a 70 per cent condition June 25 of the crop which occupies 33,960,000 acres.

Here and There in the Fruit Business

[Written for Pacific Rural Press.]

Japanese Berry Growers Sued.

The Sacramento Berry Growers' Association have brought action against six Japanese berry growers in six different suits to compel them to abide by their contracts as members and recompense the association for all berries they have sold to outside parties. Their contract does not end till 1920, and provides \$1 a crate indemnity to the organization for all sold outside its sphere. Each defendant is said to have so disposed of 350 crates. An accounting will be demanded.

Ripe Cherries Brought Good Prices.

In regard to ripe fruit carrying and keeping better than unripe fruit, H. G. Keesling of Mountain View said that many years ago he shipped dead-ripe cherries to the New York market in the face of repeated remonstrance from the shipping firm who handled them. Two shipments to which particular exception were taken because of their dead-ripe condition, brought the highest prices obtained that year. Experiments have been and are being carried out by the Pomological Department of the University of California on the maturing of fruit in storage and transportation.

Soil Moisture Studies.

What tree needs the most air in the soil? This question is answered by Dr. J. C. Whitten of the University of California in a recent talk with the growers. "The cherry needs the most air in the soil and the pear can do with the least air. If the soil becomes excessively laden with water round a cherry tree's roots, in a very short time the feeding roots turn yellow, become inactive and soon cease to function entirely and decay. On the other hand the cherry suffers from inadequate moisture more quickly and to a greater extent than other trees. For this reason, irrigations must be more frequent and less in volume to conserve the equable soil moisture condition best fitted to the tree's well

being. A pear tree can stand having the ground saturated, provided there is ordinary drainage and still not suffer.

Prohibition Helps Fruit Consumption.

Prohibition is going to be a good thing for table grape growers, in the opinion of V. D. Ely, an eastern representative of fruit buyers. It will mean a big demand for anything running to sugar. For a man who has been used to alcoholic liquor takes sugar when he cannot get the spirit. Buyers consider that green fruit men are asking prices that are unreasonable. But the thing is they are selling the fruit without effort because of insistent demand, and it is not unusual to seek for all the market affords. As one grower said, "We are not here for our health—we have plenty of that."

Standardization of Apples.

It is said in the trade and by officials of the Bureau of Markets that California is behind in the matter of standardization. It has not yet been carried far enough—Oregon and Washington are ahead of us in thoroughness only we don't realize it. Our legislators passed the standardization law but withheld the means to carry it out by trained men. This is why California apples do not occupy as high a place in the trade as some other sections of the country having standardization. It has not yet been universal. In the scramble for trade we must run as fast as the other fellow or be content to pick up what is left.

Grape Growers Ask Demobilization.

The grape growers of the State have sent a dispatch to President Wilson requesting the issuance of a proclamation of demobilization in order that the 1919 crop of wine grapes may be saved. The crop is estimated at a value of \$12,000,000. E. M. Sheehan, Secretary of the State Viticultural Commission, says that no market exists for the sale of dried wine grapes and customs duties prohibit the profitable export of dried wine grapes to Mexico. No one has yet attempted to make grape syrup in a commercial way. The Viticultural Commission ceases as such on July 21, and its activities will become a department of the new State Board of Agriculture under the consolidation law.

A Pioneer in Grape Improvement.

One of the earliest attempts at improvement of grapes by selection on a commercial scale was carried out by Mrs. Dr. Sherman (nee Eschelman) in the San Joaquin Valley about 22 years ago, according to A. C. Kuhn of San Jose. She had three acres of Emperor grapes and, in order to select the best wood for propagating she took a man around with her and put a dab of white paint on the heaviest producing vines. The following year she went over the vineyard again at harvest time and put on a dab of red paint. Then from those vines which carried both colors the cuttings were selected for the planting of the most productive vineyard in that section.

The Fruit Growers of California, Inc.

We recently called on President R. P. Van Orden of Mountain View (Santa Clara County), to find out the extent of the proposed activities of this new fresh fruit marketing organization and when it would be ready to do business. He told us that this year's work would be chiefly confined to organization and the signing up of membership. The full details of the work have not yet been defined. The new organization intends to deal with the fresh cots as the market demands. For instance, he said that this year he was offered \$100 a ton for his apricots and sold them after giving due notice to the Prune and Apricot Growers' Association, according to the terms of his contract. It

paid better to sell green at this price than to dry them. This fresh fruit organization now organized and incorporated is "purely co-operative," he said, and was in no way intended to compete with any other co-opera-

tive organization of a similar character. All its existing members are also members of the Prune and Apricot Growers' Association, from which body they will be accorded active support.

plant the King of Cover-Crops!

Germain's MELILOTUS INDICA

99³⁵/₁₀₀ % PURE!

Take no chances. The best is always the cheapest in the end.

Why run the risk of getting a bumper crop of weeds? Why gamble with low-germination seed?

Every experienced orchardist knows the value of Melilotus Indica as a cover crop--no need to dwell on that fact. All you need to know is that you are getting the best seed your money can buy.

The reputation of the Southwest's oldest and largest seed house stands solidly back of "Germain's 99-35 100 per cent. Pure."

Suggestive Agricultural Tips

(Written for Pacific Rural Press.)

Black Aphis and Horse Beans.

Black aphis on horsebeans often ruin the crop. They were controlled by Ed. Weeks and F. C. McCormick, one of whom had thirty acres of horsebeans near Pescadero last season. They gave the bugs a strong dose of one pint blackleaf 40 per 100 gallons of water and four pounds of soap. This was applied to the vines with three vermored nozzles, spraying from the top and both sides at once. The horsebeans yielded 40 sacks per acre and sold at \$5.60 per hundredweight. One Japanese in this territory is said to have sold \$14,000 worth of horsebeans from 45 acres. [This is fine, but we are not advising readers to plunge into horsebeans until they are sure of a market. They can be sold green in the pods or dried and threshed. In the latter case, horsebeans have the disagreeable reputation of being particularly weevilly.—Ed.]

Fraudulent Sweet Corn Packing.

Fraudulent packing of sacks of green sweet corn in Alameda county is getting some growers into trouble. The system is to insert a stove pipe in the sack and pack good corn around it. Inferior ears are dumped into the stovepipe, which is then withdrawn and good corn packed over the top of the bunco core. Prosecution is likely to follow such practices.

San Joaquin Cotton Prices.

The Egyptian long staple cotton grown in the San Joaquin Valley in 1918 has been purchased by the California Products Company of Fresno. This purchase covers the cotton pool at Fresno and also the one at Bakersfield. Prices received by growers were as follows: Extra grade, 1½ in., 46½c; choice grade, 1½ in., 46c;

standard grade, 45c; medium grade, 42c; mixed grade, 42c.

How Should We Measure Water?

There is an abominable labyrinth of expressions by which water measurements are given and which require a mathematical education along with a handbook for reference in converting one expression into the equivalents as expressed the other way. A miner's inch day, a second foot of water, an acre foot of water, and a thousand gallons per minute—of what relation are they? How do I know how many acre inches my pump will furnish at 1000 gallons per minute or running 50 miners' inches. Why shouldn't we first have a legally defined uniform expression of measurement and as fast as practicable work over our commercial expressions to conform. A bill introduced in the last Legislature to standardize water measurement by second-feet died a strangling death in the Senate. It may be that the standard unit should be acre-feet, which everybody understands. Meters are already in use which indicate and record their measurements in acre-feet or fractions thereof. We ought to get back of such a movement in the next Legislature.

Farmers' Mutual Fire Insurance.

Nearly 2000 farmers' mutual fire insurance companies in the United States have a total of \$6,000,000,000 of insurance now in force. The average membership is about 1532 and more than four-fifths of the companies allow each member one vote only, regardless of the amount of insurance he carries. Bulletin 786 of the U. S. Department of Agriculture points out several advantages that would accrue to such companies if they were more uniform in their systems of organization.

Our Grain Dockage Handicap--Beat It

(Written for Pacific Rural Press.)

The problem of getting pay for dockage in wheat is peculiar to California, writes President Geo. H. Sawyer of the Stanislaus Farm Bureau, because we handle grain in sacks. The grain has to be bulked before being cleaned, as our combined harvesters do not have adequate facilities to separate the barley and oats from wheat, and sack them separately. To bulk the grain for cleaning and to resack it for shipment is a great waste of scarce, high-priced labor. Therefore, it is not cleaned until it is bulked at the mills preparatory to grinding.

"All wheat must be cleaned before it is milled. This is an expense in the operation of making flour which is charged against all flour and paid for in the price paid by the consumer. Now to ask the producer of the wheat to pay for the cleaning and also charge it to the consumer is an outrage."

Mr. Sawyer was arguing for the U. S. Grain Corporation to pay 1½ cents per pound for all valuable dockage found in wheat. The Grain Corpora-

tion proposes to allow to producers all that the latter can get for the dockage but deducting whatever the cleaning costs. As it is estimated that the cleaning would not be repaid unless five per cent of the gross weight is valuable dockage, there is not likely to be much return to the growers for dockage. It is believed that this year's wheat crop will not show over five per cent average dockage even considering that a great deal of wheat is mixed with volunteer barley. Therefore farmers cannot expect to sell their dockage after cleaning at the mills for enough to net them anything. Meanwhile, if they have 5 per cent of dockage, they will directly or indirectly have paid freight and hauling costs on 100 pounds of dead loss for every ton of wheat they sell.

Save that 100 pounds for yourself and do not pay the freight on it. Get a grain cleaner and use it on your own farm. While you are emptying the sacks and refilling them, or writing out checks to pay other men for this work, meditate on the saving you could make if you were handling the grain in bulk without sacks!

YIELDS INCREASED BY LETTING ROOTS TO THE SUBSOIL.

Rice growing reduces alkali and adds to the humus, but it does not exhaust the soil as so many people seem to believe, according to Manager J. G. Beekler of the Dodge Land Co. in Butte county. But it does tend to form under the top soil a hard layer which does not permit water or roots to penetrate deeply. This is no serious handicap to the use of such land for grain as shown by the extra big crop of Early Baart wheat grown on three-year rice land, as pictured elsewhere. Mr. Beekler opened the subsoil to moisture, air, and roots by breaking up that hard layer with a Killefer tractor chisel. Another implement of the same kind resulted in a good crop of grain for Barnard Bros. of Los Angeles county, where they used it; while on the balance of the ranch their grain grew about six inches tall and burned up. In San Diego county, C. M. Pilgrim had twelve acres from which he cut about three tons of hay per year. He subsoiled this eighteen inches deep with a tractor subsoiler and the first season produced nineteen tons of hay with a rainfall of only eight inches. There are thousands of acres of grain land in California that are practically non-productive because rainfall is not conserved. Thorough subsoiling or deep chiseling would make much of this yield well above the cost of the extra labor and interest on investment.

KILLEFER
QUALITY

Tractor Chisel

Catalog No. 60

Now is the time to commence deep chiseling and subsoiling. Do it in time to prepare the ground thoroughly to receive the benefit of the winter rains. Break away from the old habit or mistaken idea of scratching the ground and expecting to harvest a crop.

Deep chiseling is becoming recognized by the successful rancher as the best means of breaking land in order to be reasonably sure of obtaining a fair return for labor and material expended. Our Tractor Chisel is largely used by the beet and bean growers and will open the ground to a depth of from ten to fourteen inches, aerating the soil and allowing the water and air to penetrate below the plow sole. The frame made in the form of an "A" is ¾ inch by 6 inch high grade steel. The standards, ten in number, are made from special steel and the ¾ inch by 6 inch. Axles 3 inches. Width of frame 8 feet. Total weight, 4300 pounds.

Five Standard Subsoilers

Catalog No. 33

K
KILLEFER
EFFICIENCY

By the use of our Subsoilers, a great many ranchers have been able to increase their yield from 20 to 50 per cent. YOU CAN DO THE SAME.

Land that has been abandoned as non-productive has been made to produce good crops after subsoiling has been resorted to. Write to us, tell us your troubles and soil conditions. We have published a book on "Deep Tillage vs. Old Method," and it shows what has been accomplished by the use of our Chisels and Subsoilers, and we want you to have one of them for it may help you solve the problem of your land and enable you to produce more and better crops. It is yours for the asking.

We make subsoilers with one, two, three and five standards, suitable for tractors from the smaller to the larger ones. We also make the three and five standard Subsoilers with an automatic lift and will furnish you with cuts and description upon application.

OXNARD SUGAR COMPANY LABOR.

(Written for Pacific Rural Press.)

The Oxnard Sugar Company in Ventura county has been making a special study of conditions that should be to the greater comfort and contentment of their "help." This large factory employs some 800 hands during the sugar season in the factory, while there are 600 to 700 men in the fields. Apart from the factory hands who live in the town, there are 15 attractive modern bungalows for the office force. In addition, there is a small settlement of adobe houses for the Mexican field laborers, built to suit their gregarious tastes and customs. There are 48 adobe buildings set out in streets with water and sanitary arrangements installed. Each building accommodates two families, each within its own domain. The Mexicans themselves make the adobe bricks and the cost of these double houses when built was approximately \$400 each.

Care of Labor.

R. Beck, the assistant manager, spoke of the high economic importance of adequate housing and comfort for the help. He said that even last year any man that could take care of his labor satisfactorily had no trouble in obtaining all the hands needed. Those who were not prepared with living quarters and boarding facilities were the men who were short of help and embarrassed at harvest time. He suggested that it would be a good plan if two or three small farmers who did not need a man all the time, could build a community cottage for the accommodation of one family, who could help them in turn. The firm is now building outlying houses for labor in different parts of their large estate, so that the men won't have so far to go to work, and can attend to their own gardens. Also in this way they hope to get individual men to take small sections of the land to farm on contract and thus eliminate the large contractors. Small, comfortable, individual quarters will help to do this. Lime from the sugar works is distributed gratis to men farming the company's lands for local use.

Rotation of Crops.

Rotation of crops is invariably practised—beets and beans being grown alternately. On light land beans are grown for two or even three years in succession and then beets for one year only. On strong land one year of beans is enough to keep the land in condition for a beet crop. Beet by-products and bean straw are put through the silo, fed and returned to the land. One of the farmers built a beet-top silo.

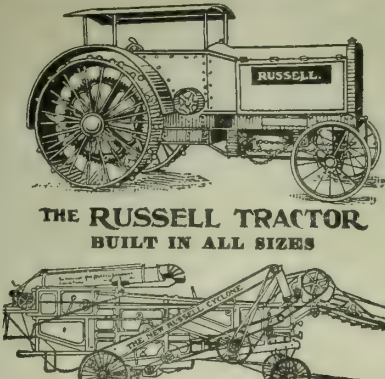

Commercial fertilizers have been tried, but rotation of crops is found better for keeping up soil fertility—that and a supply of humus, which is the chief thing wanted.

The requirements of labor and the demands for the improvement of soil fertility are two fundamentals that receive first consideration from the Oxnard Sugar Co.

OFFICIAL DECLARATION OF LAND VALUES.

The Railroad Commission, in a decision recently handed down authorizing the San Benito Land and Water Company to increase its rates for service, declares that the increase in land values from \$60 an acre as grain land to from \$800 to \$1500 an acre as bearing orchard land, is directly attributable to the irrigation work of the San Benito Land and Water Company. It tells the ranchers "that present conditions cannot continue without wrecking the company and causing large losses to themselves." It suggests the formation of an irrigation district so that the expense of the system will be equitably distributed among all irrigators and land-owners who may benefit from it when they desire.

Wine grapes are being bought for cash, offers of ten cents a pound being not uncommon, according to the Turlock Tribune. Dried black wine grapes are supposed to be bought for the purpose of domestic wine-making.

Stock Raising in Western Canada

is as profitable as Grain Growing

In Western Canada Grain Growing is a profit maker. Raising Cattle, Sheep and Hogs brings certain success. It's easy to prosper where you can raise 20 to 45 bu. of wheat to the acre and buy on easy terms.

Land at \$15 to \$30 Per Acre
— Good Grazing Land at Much Less.

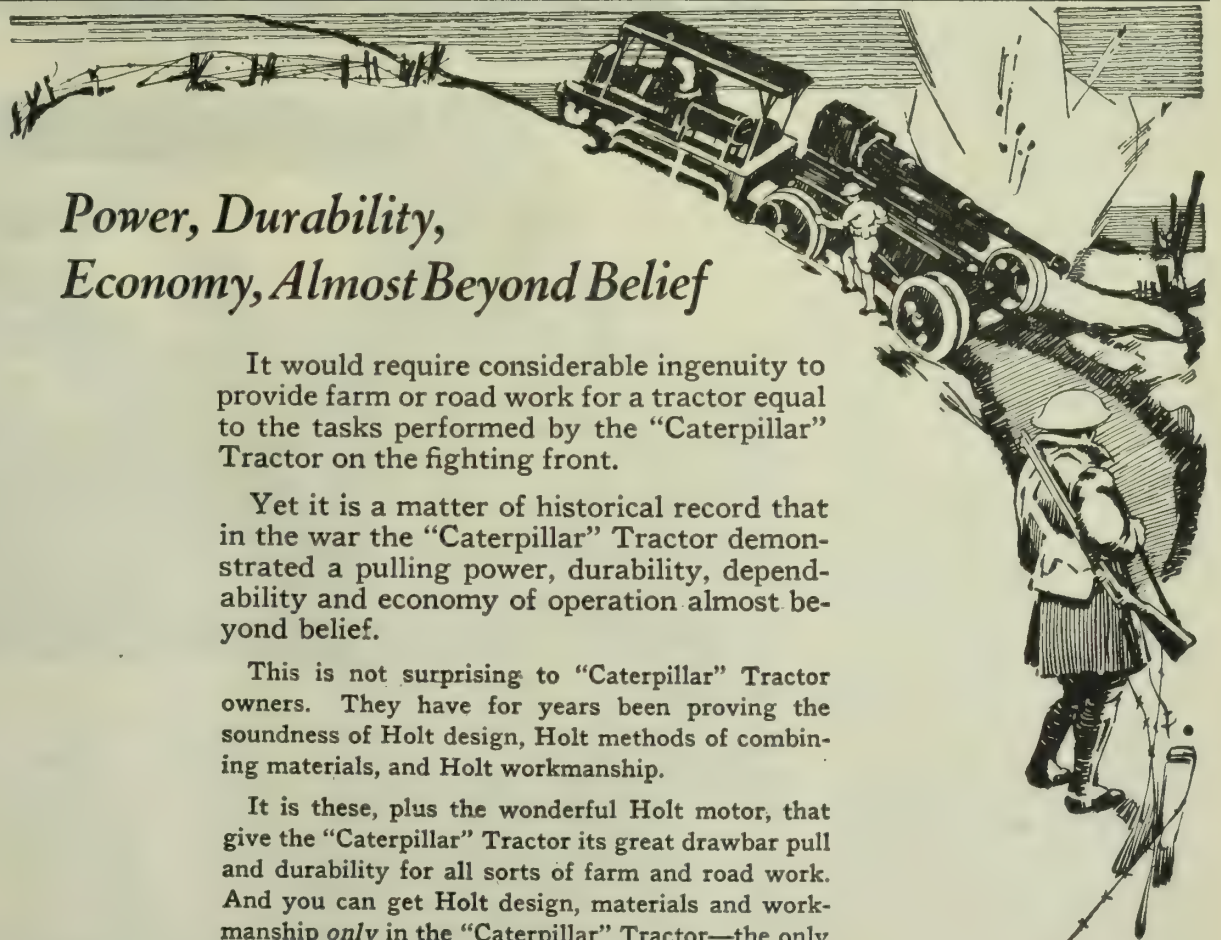

Railway and Land Co's. are offering unusual inducements to home-seekers to settle in Western Canada and enjoy her prosperity. Loans made for the purchase of stock or other farming requirements can be had at low interest.

The Governments of the Dominion and Provinces of Manitoba, Saskatchewan and Alberta extend every encouragement to the farmer and ranchman.

You can obtain excellent land at low prices on easy terms, and get high prices for your grain, cattle, sheep and hogs—low taxes (none on improvements), good markets and shipping facilities, free schools, churches, splendid climate and sure crops.

For illustrated literature, maps, description of lands for sale in Manitoba, Saskatchewan and Alberta, reduced railroad rates, etc., apply to Superintendent of Immigration, Ottawa, Canada, or

Power, Durability, Economy, Almost Beyond Belief

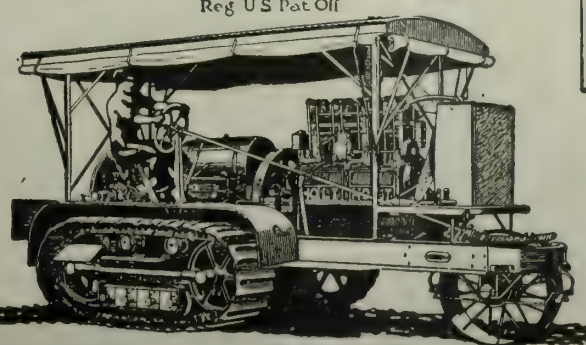

It would require considerable ingenuity to provide farm or road work for a tractor equal to the tasks performed by the "Caterpillar" Tractor on the fighting front.

Yet it is a matter of historical record that in the war the "Caterpillar" Tractor demonstrated a pulling power, durability, dependability and economy of operation almost beyond belief.

This is not surprising to "Caterpillar" Tractor owners. They have for years been proving the soundness of Holt design, Holt methods of combining materials, and Holt workmanship.

It is these, plus the wonderful Holt motor, that give the "Caterpillar" Tractor its great drawbar pull and durability for all sorts of farm and road work. And you can get Holt design, materials and workmanship only in the "Caterpillar" Tractor—the only tractor of the track-type used by the Allies in the great war—chosen and proved by severe and prolonged tests.

Get your "Caterpillar" Tractor now. Send for Catalog 403.

Farm Owners' and Operators' Nat'l Assn.

(Written for Pacific Rural Press.)

FRUIT RANCH GETS PLENTY OF HELP.

Seven thousand dollars in one month was paid last year to Y. M. C. A. boys for picking fruit on the ranch of Losse Bros. in Santa Clara county. A hundred and fifty boys were employed at 35 cents per hour. Messrs. Losse liked them so well that they offered the same wages this year. The boys liked the work so well that they grabbed the chance and agreed to come. Other farmers, however, liked the idea so well that they offered the boys higher pay, and Mr. Losse simply agreed to meet whatever scale may generally be in effect. Such a condition is a pocketbook argument for organized action on the part of farmers, not only to standardize wages, but also to take measures to secure enough help during harvest so that such wages could be maintained without loss of crops by individual ranchers. Such an organization is already active in California, including Santa Clara Valley—the Farm Owners' and Operators' National Association.

The boys were not cared for in a haphazard way, nor were they treated as bums. In fact, they are housed and fed separately from the rest of the ranch help. As the Losse Bros. have sold part of their ranch and will have only 700 or 800 tons of apricots, besides pears, peaches, and plums, to pick this year, they plan to have only 125 boys. But absolutely new quarters are being built at a cost of \$1,000, using lumber from Camp Fremont. The big mess hall has screened sides. Boilers and kitchen are at one end, and behind the boilers is a cement floored room with several shower baths, which will supply hot water any time. This water, with waste

from kitchen and from toilets goes into a new septic tank just built. Sleeping quarters for the boys consist of a mammoth lattice-work building boarded up high enough to insure privacy, but open enough to give the boys all the good air they need—almost like camping out. Regular ranch workers are housed in a big building with baths and all sanitary conveniences and a separate room for each man upstairs over the mess hall. Ten or twelve Chinese who do the pruning, etc., have their own separate bunkhouse with good accommodations. Janitors will keep the place clean.

The Y. M. C. A. boys furnish their own cook, food, and bedding, but Mr. Losse furnishes cots and mattresses. They are divided into small gangs for the fruit picking, and are under

proper Y. M. C. A. supervision. Certain boys are detailed in rotation to make beds, clean the place, etc. They have their good times after work.

Wage Scale for Canneries.

Ralph P. Merritt was appointed by Governor Stephens to consider the wage demands of employes of California canneries and packing houses at

the suggestion of the operators of these plants that a regulator be employed to consider these demands. They agreed to abide by any decision made by the Governor's representative and to establish any wage scale he considers necessary. The wage scale is to hold from July 1, 1919, to January 1, 1920.

PREMIER BURNER THE STANDARD

The Scientific World has acclaimed THE PREMIER the Standard by which all Burners are Gauged—a Burner is either as good as the Premier, or it isn't.

Time has proven the Premier, absolutely dependable. There can be only one best, of any similar article. You can have your own Gas Plant—

The Premier makes this possible. You can save a substantial portion of your fuel expense—

The Premier makes this positive. Makes a Clean Gas from Kerosene (Common Coal Oil) Descriptive Circular Sent upon Request.

Complete outfits—\$12.50 and up, according to requirements.

225 MARKET STREET,

SAN FRANCISCO, CALIF.

TRADE MARK K-W High Tension MAGNETOS Fire Any Kind of Fuel and Get Maximum Power Out of Every Drop Used

Some Plowing Job This!

It takes a lot of Reserve Power to pull two 24 inch bottoms through stiff sod land like this and turn clean furrows ten inches deep.

This Reserve Power is only available when the fuel is fired by the hottest spark known, such as that delivered by a K-W High Tension Magneto.

This K-W equipped Holt tractor pictured here makes easy work of jobs like this, because the K-W Magneto gives the hottest known spark, timed accurately. This intense spark fires the mixture rapidly, thus releasing the energy contained in the fuel in the shortest possible time and delivering maximum power to the piston.

Owners of K-W equipped tractors are also able to fire leaner mixtures and use cheaper grades of fuel and still develop full power from their engines. As a result they materially reduce their plowing cost per acre.

But of even greater importance than this fuel saving and reserve power is the Reliability of K-W Magnetos. This known reliability is

only natural because K-W Magnetos are built for tractor service and made their reputation for reliability on tractors. Two manufacturers have used K-W Magnetos as standard equipment for over 9 years; 18 for over 5 years; as many more for from one to 5 years.

Time is the Only Test of Reliability.

Make sure the tractor you buy is K-W equipped. Write for a list of K-W equipped tractors and free booklet, "Plow This Additional Acreage Without Fuel Cost."

THE K-W IGNITION CO.
2889 CHESTER AVE. CLEVELAND, OHIO, U.S.A.

IMPROVE YOUR OWN VEGETABLE SEED.

It is already time for us to think of the vegetable seed we are to use next year. If we save it ourselves, we know the quality of the vegetable it comes from. A few suggestions from a paper read by Prof. S. S. Rogers at the Riverside Fruit Growers' Convention, are timely now.

Good seed true to type mean larger yields of high quality crops. It may therefore be readily understood that the initial cost of the seed is negligible as compared to high germination and trueness to type.

Improvement of seed is accomplished in two major ways—hybridizing followed by selection and selection alone. The hybridizing requires almost unlimited capital in money or persistence, or both, and many years. It must be left to specialists like Luther Burbank. But anyone can begin improvement of seed at once by selecting the plants bearing most desirable crops and having the most desirable characteristics of the plant itself. Selection may be for higher yields, better quality, earliness, uniformity, etc.

The most important consideration is to have a definite ideal to select toward. This ought to conform to market demands. The same person will have to carry it on from year to year, and a written description of the ideal in detail will be necessary in order finally to arrive at that ideal. The closest approximation to the ideal must be selected each year, provided not too much deterioration is found in other desirable characteristics. Frequently several plants will be about equally near the ideal. In this case, selection from them may well be made for other characteristics. Thus the ideal type will sooner or later be found approximately and will become fixed enough to depend upon for seed.

Selection should not be made for individual fruits, such as tomatoes or melons, etc., according to Prof. Rogers, but should be made for the character of the entire crop on the vine. In selecting for earliness, do not choose only the first-maturing fruit, but choose the vine which matures its whole crop first, if that crop is of the type desired.

COTTON ACREAGE AND CONDITION.

The 1919 cotton acreage in the U. S. is nearly nine per cent less than in 1918; and the acreage in California is 12½ per cent less than in 1918, according to a report based on July 1 conditions and issued by Field Agent E. E. Kaufman of the U. S. Bureau of Crop Estimates. Of the estimated 33,960,000 acres growing cotton in U. S., California has about 169,000, of which about 142,000 are in Imperial Valley. The decrease in Southern U. S. is largely due to concerted action of planters for that purpose, and partly due to unfavorable conditions at planting time. California conditions July 1 were highly satisfactory, being estimated at 99 per cent of normal as against 70 per cent for the U. S. The 173,000 acres which were picked in California last year yielded 97,700 bales as against an estimated 114,000 bales to be picked this season if no unfavorable conditions shall arise. On the other hand, the yield for U. S. seems likely to decrease by more than a million bales, having been close to 12,000,000 bales last year. The Blythe district in Riverside county has increased its cotton acreage by more than 5000, and has a prospective crop of 18,000 bales. The San Joaquin valley had about 2500 acres last year, half of which was picked, yielding about 500 bales. This year about 8000 acres were planted, of which about 5000 are in Fresno county. The prospective San Joaquin valley crop is about 3000 bales.

ADAPT FARMING TO TRACTORS.

(Written for Pacific Rural Press.)

Many failures with tractors have been due to the attempt to give them identically the same work and the same working conditions that horses would have. A general realization that the tractor has opened new possibilities in economical farming is being followed by the realization that the limit of such possibilities cannot be reached by our old methods. Farmers who are willing to change their methods and adapt them to the particular nature of tractors are opening new fields of opportunity. Some have found that a change in distance between rows of beans, beets, etc., permits use of tractor planters, cultivators, and harvesters where they couldn't be used with rows as ordinarily planted. Fields and headlands and fences have been laid out for horses in a way that is wasteful when tractors are used and thus make tractors less economical. To study such features of tractor farming, President F. H. Poss of the California Tractor and Implement Association recommended at its last meeting that a "Standardization Committee" be appointed with power to make detailed recommendations for changes in farm operations which will add greatly to the economy of tractor farming.

CALIFORNIA GRAIN FORECAST.

Grain crops as forecasted July 12 on the basis of July 1 by J. E. Rickard of the U. S. Crop Reporting Service for California show the following: Wheat, 13,914,000 bushels, based on a condition of 83 per cent normal as against 73 per cent last year and 80 per cent for a ten-year average; barley, 31,546,000 bushels on 82 per cent condition as against 75 per cent last year and 86 for a ten-year average; oats, 5,542,000 with 84 per cent normal condition as against 79 percent last year and 84 per cent ten-year average; rice, 8,680,000 bushels on 140,000 acres this year with a condition of 94 per cent normal as against 90 per cent last year on 108,000 acres (102,000 were harvested); white potatoes, 12,250,000 bushels on 91,000 acres with a condition of 88 per cent normal. Acreage last year was 93,000.

SMALLER BEAN CROP IN STATE.

The acreage planted to beans in California this year is 415,000 compared to 597,000 in 1918, according to crop report issued today by E. E. Kaufman, Field Agent, Bureau Crop Estimates. Southern California shows decrease in acreage of about 15 per cent, and north

of Tehachapi there is a decrease of fully 45 per cent.

The condition of beans of all varieties is only 75 per cent of a normal compared to 90 last year and a 10-year average of 91.

A condition of 75 per cent forecasts a probable production of 5,602,000 bushels of beans for the 1919 crop.

The Lima bean crop alone shows a condition of only 59 compared to 94 last year and 91 in 1917. Deficiency of soil moisture at planting time and afterward besides a fungus disease causing more or less wilt is the direct cause of this poor condition of Limas.

The premium list for the 1919 California State Fair, August 30 to September 9 inclusive, has been enlarged considerably this year, for all divisions except the one for exhibits of beverages. The wine premium list has disappeared and prizes offered this year are for cider, soda water and mineral water principally. Approximately \$45,000 in cash prizes have been offered in addition to trophies and ribbons to be awarded in various divisions.

Mechanical Power on the Farm

Users of tractors, engines, pumping plants, motor trucks, automobiles, electric motors, and other mechanical farm power are invited to make this department an exchange of their experiences and troubles.

TRAILERS AUTOMATICALLY STEERED.

The first trailers put on the market were not much of a success when traveling at motor-car speeds. They wobbled so much that they were dangerous to other machines on the same road, and were especially dangerous to themselves on narrow mountain roads. They required too much power for economy, because, whenever the car pulling them made ever so slight a turn, the trailer did not follow the tracks but had to make new tracks of its own.

Recent improvements in trailers have eliminated these defects by providing steering devices which make the trailer follow steadily in the tracks already made, according to H. L. Mason of the Los Angeles Trailer Co.

In designing an automatic steering device, several features had to be considered. A trailer is sure to encounter bumps in the road. Its springs are intended to minimize the shock of such bumps. Therefore the steering device must not prevent free up and down movement of the axle and wheels. For this reason, the drawbar must not be hitched to the axle and should not be used as a steering gear. Neither should it be rigidly

attached to the steering gear. But manifestly the steering gear, to be automatic, must be regulated either by the drawbar or by another attachment to the motor car or truck. The latter scheme has not, so far as we know, been worked out satisfactorily, but the Los Angeles Trailer Company has hitched its drawbar directly to the frame of the trailer and designed a flexible connection between the drawbar and the parallel rod in front of the axle which works the automobile-type steering of the wheels. On top of the center of the parallel rod is a triangular steel bracket. A vertical pin turns in ball bearings in the apex of the triangle and in the center of its base. The triangle is properly braced, for the strain of steering comes on the pin. A flat steel arm has a hole near one end to fit over a pin fixed on the trailer frame over the front axle. Another hole in the arm fits over the pin in the triangular bracket on the parallel rod. The arm projects forward several inches and is joined by a knuckle joint to a bar which projects still farther forward and is joined at its forward end by a knuckle joint to two short, heavy steel bars hanging vertically from the drawbar. The knuckle joints permit plenty of play up and down, but none sidewise.

When the motor car turns the trailer drawbar, it exerts leverage on the pin and the triangular bracket and the parallel rod sidewise, thus automatically turning the wheels.

NEW POWER LIFT PLOW ATTACHMENT.

A new attachment on Knapp tractor disk plows attracted considerable attention at the Sacramento demonstration. They are all equipped with power lift, which was designed on the basis of the original Knapp plows so it can be installed on any of them. By the new attachment, the power lift is never in action except when actually raising or lowering the plows. An eccentric trip disengages the chain from the ratchet which runs it to raise or lower the plows as soon as that is accomplished. Depth of plowing is regulated by a hand wheel which operates a worm gear.

LITTLE TRACTOR MOVES HOUSE.

We have before us the picture of a little Cletrac tractor pulling a five-room house through the streets of Chula Vista and 2½ miles into the country. The house was jacked up so that timbers supported on broad roller wheels were put under it. The tractor hitched to the house looks utterly unable to move it, but it not only hauled the house over the roads, but ended up by pulling it over plowed ground to the center of an alfalfa field, where it is now used as a tenant house.

THE SELF-OILING WINDMILL

has become so popular in its first four years that thousands have been called for to replace, on their old towers, other makes of mills, and to replace, at small cost, the gearing of the earlier Aermotors, making them self-oiling. Its enclosed motor keeps in the oil and keeps out dust and rain. The Splash Oiling System constantly floods every bearing with oil, preventing wear and enabling the mill to pump in the lightest breeze. The oil supply is renewed once a year. Double Gears are used, each carrying half the load. We make Gasoline Engines, Pumps, Tanks, Water Supply Goods and Steel Frame Saws. Write AERMOTOR CO., 2500 Twelfth St., Chicago

The Transmission of Power

A Transmission Belt that will give continual and satisfactory service will pay for itself in one season by eliminating costly shutdowns, etc. If you can depend upon it you are relieved of all worry. Don't peg along with a makeshift belt. You are losing money every day.

TEST SPECIAL BELTING

You never need worry when there's a TEST SPECIAL on the job. Always running. No breaks or shutdowns.

Test Special is made of long fibre cotton and high grade vulcanized rubber. Its plies will not separate, even when subjected to the most severe abuse. The TEST SPECIAL is guaranteed to give longer and better service than any other rubber belt made. Investigate it now.

Fill Out Coupon—Mail It Now

Let us take care of your belt problems. Our engineers will advise you without charge. If you are having difficulty with the belt you are now using, write to us and we will tell you how to make the proper adjustments.

Fill out and mail this coupon for samples and complete information about TEST SPECIAL BELTING.

NEW THRESHER ON MARKET.

The Twin City All-Steel Thresher is a late addition to the power farming machinery line of the Minneapolis Steel and Machinery Co. Features of the machine are triple tandem chafers, giving a total separating area of 84 square feet in the 22-42 machine; an auxiliary cylinder which re-threshes unthreshed heads and tailings and delivers them not back into the straw, but direct to the grain pan for cleaning; a special feeder controlled by a Pickering governor to regulate the volume of grain fed to the cylinder; a special spreading cylinder with skew blades, which spread the grain to the full width and take maximum amount of grain without danger of choking; fishbacks and lifting fingers on the straw racks increase the speed of straw as it passes rearward and give no chance for bunching; sieves adjustable to various-sized mesh in a minute so that no changing of sieves is necessary; all bearings outside may be oiled while the machine is in motion.

TRUCKS SAVE MILK IN SOUTHERN CALIFORNIA.

Complaining that milk shipped from their ranch via the railroad arrived in Los Angeles in a bad condition and was therefore forced on the market as sour cream, R. S. Smith and George Wiegand put on a motor truck, and, according to a petition filed with the Railroad Commission, solved the milk shipping problem. They ask for a permit to continue in the motor truck business, declaring that the demands of the other ranchers for general service will justify the maintenance of a truck line. In support of their contention, they cite the fact that they are now using four trucks hauling milk under contract. Their proposed route is between Los Angeles and San Jacinto, Temecula, via Riverside.

MOTOR TRUCKS RAISED MILK PROFITS.

Dairymen of the San Jacinto-Temecula districts in Riverside county have been enabled to get increased prices for their milk in the Los Angeles markets by reason of a commercial motor truck route and the transportation rates have been attractive to the dairy men, according to announcement of the State Railroad Commission in granting the truck operators further privileges in handling other products.

FARMERS WILL HAVE THEIR "DRIVE."

Harvest activities by the farmers are so general at the present time that the Farm Owners' and Operators' Association is not for the moment centering its activities on the solicitation of memberships in the field. Instead, it is shaping its plans for an unusually active drive through a dozen or more counties as soon as the farmers have finished their harvest work.

At the offices of the State Organization Committee in Stockton a letter census is being made of sentiment in the different counties. Lists are being compiled, forms adopted, routes mapped out, and a definite plan evolved for a strongly organized drive just as soon as the State Board gives the word.

Most farmers, especially those who are grain raisers, are too busy to attend meetings at present, but by scores and hundreds they are pledged to personal co-operation as soon as the big drive begins. The work of organization is to go forward in several counties at the same time. Local leadership is to be aided by the presence of some of the best-known farmers in the State. In the mail received at the State office there are continuous pledges of personal service. From Kings to Sutter and from Santa Cruz to Ventura there will be under way in a few weeks a drive that will complete the organization of the strongest State Association ever formed by the agricultural interests.

The area under olive trees in Italy is estimated at 5,683,000 acres, the same as in 1918.

The
New
12-20
RUMELY
OILPULL
TRACTOR

Cheapest in Cost per Year of Service

On what basis are you going to buy *your* tractor—by the dollar of cost or by the years of service?

Advance-Rumely is one tractor manufacturer who insists upon putting quality first. By quality we mean rugged, dependable construction, surplus power, real fuel economy and all around service.

In building the new 12-20 OilPull, Advance-Rumely refused to put out a cheap, lightly constructed tractor. We know and you know that durability can't be combined with cheap, light construction. And if a tractor won't "stand the gaff" nothing else about it counts for much.

We have embodied the proved OilPull ruggedness and substantial construction in this small, light weight 12-20. And by light weight we mean *right* weight—the proper weight to give long lasting, year after year, dependable service.

Like all OilPull tractors, the 12-20 is backed by a *written guarantee* to burn successfully all grades of kerosene under all conditions, at all loads to its full rated brake horsepower.

And just as Advance-Rumely guarantees its OilPull tractor as a cheap fuel burner, it insists upon giving the purchaser a surplus of power. The 12-20 rating is based upon only 80 per cent of its maximum power efficiency—a 20 per cent overload capacity when you need it. This means further insurance of long life—a tractor that will be doing the same good work five years hence as in its first season.

The 12-20 is oil-cooled—no evaporation and the radiator can't freeze. The circulating system is always open and oil preserves the metal parts. The OilPull cooling system keeps the motor at the right temperature at all loads—the harder the OilPull works, the cooler it runs.

On the 12-20 the belt pulley is on the right hand side—up within full view of the operator. The 12-20 can be lined up with a belt machine, backed into the belt and the belt started and stopped from the platform. The belt pulley is driven direct off the crankshaft—no loss of power.

The 12-20 OilPull will pull three 14-inch bottoms under ordinary conditions and a proportionate number of disc plows. It will operate a 22-inch thresher fully equipped and economically handle all other power jobs, drawbar or belt.

To safeguard the customer's best interests Advance-Rumely maintains 27 branch offices and warehouses, each equipped to give immediate service in machinery, parts and expert help.

The wise farmer will buy a tractor by the year—not by the dollar. Just as the OilPull will plow an acre at lower cost than any tractor built, its cost measured in years of service makes it the cheapest tractor obtainable.

Ask for the catalog describing the new 12-20.

ADVANCE-RUMELY THRESHER CO., Inc.

La Porte, Indiana

San Francisco, Cal.,
17-19 Main St.

Fuel—Guaranteed to burn kerosene successfully under all conditions.

Cooling—Oil cooled—no evaporation—non-freezing.

Motor—Heavy duty, 2 cylinder 6 in. x 8 in.—560 R. P. M.

Crankshaft—Built to U. S. naval specifications.

Frame—Hot riveted steel members—no bends—no splices.

Transmission—Cut steel gears—enclosed and running in oil.

Bearings—Hyatt roller bearings in transmission and rear axle.

Governor—Fly ball throttling type—automatic speed regulation.

Belt Pulley—19 inch diameter—running directly off crankshaft—no intermediate gears.

Lubrication—Force feed and splash.

Speeds—Two forward—one reverse.

Drawbar—Adjustable spring drawbar.

PROTECT YOUR CROPS WITH MINIMUM COST

When lack of moisture and warm weather threaten crops, irrigation will protect you from loss.

The irrigation equipment that will give you the most service is a PELTON irrigation plant—an interchangeable PELTON pump driven by any kind of engine, motor or tractor available.

Later, this pump may be permanently installed, direct connected to an electric motor, with minimum cost, and will give more water per horsepower.

PELTON dealers make quick delivery.

Livestock and Dairy Notes

Livestock breeders all over the state are invited to send on postal cards, notes regarding their sales. State and County Fair intentions, new stock, etc.

LIVESTOCK SALES DATES.

July 16—Tulare County Duroc-Jersey Breeders' Association, Tulare. Second consignment sale of 60 head.
August 2—Butte City Ranch, Butte City. Shorthorn cattle, Berkshire hogs, Shropshire sheep and Shetland ponies.
August 6—Francis T. Underhill, Santa Barbara. 100 head Hampshire hogs.
August 26—Fresno County Poland-China Breeders' Association, Fresno. Consignment sale of bred sows and gilts.
September 17—John M. Bernstein and W. L. Haag & Son, Hanford. Poland-China bred sow sale.
October 4—H. I. Marsh and Les McCracken, Modesto. Poland-China bred sows and gilts.
October 7—M. & A. L. Bassett, J. A. Crawshaw and F. D. Ross, Hanford. 75 head of Poland-Chinas.
October 16—H. M. Elberg, Roselawn Stock Farms, Woodland. 45 head of Shorthorns.
October 18—Trewitt, Vaughan and Nehls, Hanford. Poland-China bred sows and gilts.
October 29—Tulare County Poland-China Breeders' Association, Tulare. First consignment sale.

The Dairy.

S. J. Lowe of San Luis Obispo has 40 head of registered Shorthorns on his 4,000 acre ranch and runs from 300 to 400 range cattle.

The Holstein cow, Creampot Pontiac Korndyke, owned by Cole & Hicks, Grandville, N. Y., has made a record of 50.70 pounds butter from 795.9 pounds milk, thus displacing Segis Fayne Johanna in the full-age class.

J. W. McLean of San Luis Obispo has a herd of grade Jerseys that averages 6% in butterfat test. Mr. McLean is working for an average daily milk production of 35 pounds. His herd sire is Eminence Golden Chief.

Beef Cattle.

Hereafter hornless Durhams or Shorthorns are to be officially known as polled Shorthorns. This was the decision made at the last meeting of the Polled Durham Breeders' Association.

Register of

MERIT JERSEYS

A limited number of bulls for sale.

FOR LARGE AND ECONOMIC PRODUCTION

Get one of my young Jersey bulls from a high producing dam. They are rich in the blood of Gertie of Glynlyn and Lady Letty Lambert. Occasionally one old enough for service.

A. A. JENKINS, Tulare, Cal.

At the Carpenter & Ross Shorthorn sale at Chicago, June 24, 172 head sold for an average of \$2,200, which is a new world's record for the number sold. The top was the bull Cudham Dreadnaught, who sold for \$19,500. The top female brought \$6,000.

Swine and Swinemens.

F. L. Sandercock of San Luis Obispo is starting a herd of registered Berkshires and has as his herd sire Duke's Natomas Rookwood 4th.

White Triangle Ranch, Santa Margarita, are just beginning to establish a herd of registered Berkshires and have some very good foundation stock.

Judge J. C. Craig, Duroc breeder of Owensmouth, is expecting a boar and 5 sows from the east very shortly. The animals were selected by Fred DeVore and are as good as can be found.

Recent sales by the Ireland Ranch, breeders of Durocs, at Owensmouth, include: One bred gilt to J. B. McGee, Whittier, 1 bred gilt to Bard Estate, Hueneme, and 1 gilt to H. M. Lord, Marion.

The Poland-China breeders of Madera county are considering the forming of a county association according to W. A. Clarke, vice-president of the Farm Bureau, who has the matter in charge. Mr. Clarke says that he is pretty sure of 25 members.

F. M. Johnson of Napa has sold his entire herd of 40 registered Durocs to Harvey M. Berglund, Dixon, which added to his already good herd gives Mr. Berglund one of the largest and best herds in the West. Mr. Johnson will go back to Nebraska in the fall and bring out a carload of the best Durocs he can find.

Sheep.

The University Farm at Lincoln, Neb., has purchased 160 head of California lambs to eat up the green feed that otherwise would go to waste about the campus. They must have a good opinion of California stock back there.

The National Sheep and Wool Bureau is starting a campaign for a "pure goods" law that will compel marking of all fabrics so as to show whether they contain only "virgin wool" or "shoddy." It is claimed that what people have been buying for all wool is a mixture in two-thirds of the cases.

Miscellaneous Livestock.

A Placer County Farm Bureau Fair will be held at Roseville August 25-28. A livestock show will be one of the chief features.

A county fair will be held at Balboa Park, San Diego, during the last four days of September. Premiums amounting to \$1,500 will be offered. The fair will be under the auspices of the farm bureau.

SAN FRANCISCO SHOW WILL BE A HUMMER.

Yes, the wheels of progress are now moving rapidly and plans are taking shape which will make the San Francisco Livestock Show the big event of the season. Prof. Gordon H. True, who will be manager, has opened offices in the Lachman Building and is right on the job. He promises to have the premium list out soon. There will be classes for all kinds of livestock, and the premiums will be liberal. The show will open Nov. 1 and continue to Nov. 8.

Breeders will be delighted to learn that the directors expect to secure the California Building at the Panama-Pacific Exposition grounds. This is only one of many big moves that will be made by the board of directors, which consists of many of San Francisco's leading men, with W. T. Sesnon as president. Mr. Sesnon is putting his whole heart and soul into the work, and with the affairs of the Show in such capable hands its success is assured.

Too Valuable to Waste

THE PART a cream separator plays in the success of a dairy farmer is becoming more and more important. With butterfat worth about fifteen times as much as wheat and twenty times as much as shelled corn, it is too valuable to waste a particle.

Primrose and Lily cream separators are designed to save all

the cream. They guard against those daily losses which in themselves might seem trifling, but when summed up, amount to a big loss.

One of the vital differences between the Primrose and Lily and other cream separators, is that in the former there is no obstacle in the path of the cream as it leaves the bowl. They are the only separators with two wide open cream outlets.

Another difference, every bearing is oiled automatically, and the oil is forced through every bearing. You may forget, but the machine never does. Used oil is automatically drained off.

Prompt and efficient service is always at hand to make any adjustment, repair or replacement needed. See the nearest local dealer, or write us for complete information.

Tulare Sales Pavilion Ready

(Written for Pacific Rural Press.)

Months ago the farsighted breeders of Tulare County saw the important position that the section was bound to hold as a breeding center, and realized the need of a suitable place for holding public sales. The Tulare County Livestock Association put the matter up to the Tulare city people, and the result is that they now have a whole block of ground on the highway south of the city, enclosed by a 7-foot tight

cement washing floor in the center of each row of cattle stalls. Water is piped to all pens and stalls.

The grounds and buildings represent an investment of \$8500, but this is only the beginning. It is planned to erect another building double the size of the Sales Pavilion for exhibition purposes at fair times, and the enterprising people of the community are boosting for a fall fair.

The first sale in the new pavilion

One of the two hog barns adjoining the new Sales Pavilion at Tulare.

board fence. A Sales Pavilion 60 feet square has been erected; there are two hog barns, each with 15 pens of various sizes; there are two rows of 40 double cattle stalls.

All buildings have been erected with the idea of permanency. They are well built, and there are cement foundations wherever necessary. The hog barns have cement floors and tight partitions between pens. There is a

will be held July 16, when the Tulare County Duroc-Jersey Breeders' Association will hold a consignment sale of bred sows and gilts. The tops from the leading herds in the county will be offered. They represent the best blood lines of the breed, and have been bred to some of the most noted boars on the coast. With a free lunch and drinks at noon, the new Sales Pavilion will be dedicated in a big way.

Cattlemen Want Stockyards

(Written for Pacific Rural Press by R. H. Whitten.)

About the middle of last November the Sierra Vista Vineyard Company of Minurn, began feeding two carloads of grade Hereford and Short-horn steers—all by registered bulls—and gave them all the chopped alfalfa hay they would eat, together with about 8 pounds of barley each per day.

When the steers were ready for market they would have brought the top price of 20½ cents at Chicago, but locally the manager, D. B. Harris, was offered only 13 cents with a 3 per cent shrinkage, making a difference of about \$90 per head, or \$4500 on the two carloads. Mr. Harris

spent \$75 a head on the steers to put them in prime marketing condition, yet he was offered only ½ cent above the price paid for half-fat grass steers. He says that had he fed the steers hay alone for 60 days and then carried them on grass until about the first of June he could have contracted them for shipment East at 12½ cents and made money, instead of losing, as he was obliged to in selling at 13 cents after feeding the steers on high-priced grain. In other words, Mr. Harris was penalized for doing the things that every breeder should be encouraged to do—breeding up and feeding for quality beef.

We asked several cattlemen their opinion on this subject and quite a number recommended better breeding. J. H. Cazier & Sons of Wells, Nevada, White & Terry of Sacramento, L. N. Pabst of Cedarville, and W. S. & W. K. Humbert of Phoenix, Arizona, stated that they thought the passage of a law requiring the use of purebred bulls on the range would go a long way toward solving the problem. "With better breeding stock we would have heavier and better beef, matured earlier and at less cost to produce," says Mr. Humbert. Yes, that's so, and purebred bulls ought to be universally used. But it is not enough to make additional profit from

having the cattle mature earlier. There should be further profit because of the quality of the meat. It isn't very satisfactory to market steers yielding a higher quality of meat, a greater proportion of valuable cuts, and a smaller proportion of offal, and receive the price of common stuff.

Mr. Harris says that there is no competition between the large packers in California today, and that unless the cattlemen organize for marketing purposes they must expect to pay tribute to these companies. The packers say that there is no market in this State for high-quality beef, and they throw the blame on the consumers. If they are right, what's the reason for this state of affairs? Why should Californians be satisfied with a poorer grade of meat than consumers in other sections of the country demand? Do they need to be educated to the superior qualities of heavy beef? If so, perhaps it would be a good thing for the packers to use for this purpose a little of that money they are using for advertising to put themselves right with the producers and consumers.

J. A. Bunting, of Mission San Jose, recommends that cattlemen build and operate their own packing houses so that they will not be such lambs for the big packers. Mr. Harris makes a suggestion somewhat along the same line, which is that cattlemen should organize so that when the California market cannot take their stock they will be prepared to slaughter, refrigerate and ship to whatever market is the best. Perhaps this will be the ultimate solution, but it would be a mammoth undertaking, requiring lots of time, effort and money, and something of less magnitude must be done to better the situation before such a plan can be put into operation.

Stockyards owned by cattlemen—that's what most of the stock men want. Ormondale Company of Redwood City, E. A. Noyes & Son of Sutter, H. H. Gable of Esparto, H. M. Barngrover of Santa Clara, Pacheco Cattle Company of Hollister, H. L. & E. H. Murphy of Perkins, and dozens of others are strong for co-operative stockyards.

Either directly or indirectly, stockyards would solve most of the marketing problems. As stated unofficially by E. E. Nicolls of the U. S. Bureau of Markets at San Francisco, stockyards would provide an open market, competitive buying, a uniform system of grading, reliable market quotations, stabilization of live-stock loans, and development of feeder trade. And aren't those the improvements most needed?

CALIFORNIA HOLSTEIN BREEDERS STAND HIGH.

The official prize list published by the Holstein-Friesian Association shows the following amounts won by the California breeders for the season 1918-1919: A. W. Morris & Sons, Woodland, \$324; Bridgford Company, Knightsen, \$275.50; Palo Alto Stock Farm, Palo Alto, \$168.50; McAlister & Son, Chino, \$126.50; W. J. Higdon, Tulare, \$125.70; M. H. Tichenor, Palo Alto, \$113.50; A. J. Stalder, Riverside, \$97; E. E. Freeman, Modesto, \$90.25; J. H. Harlan Co., Woodland, \$78.50; Gotshall & Magruder, Ripon, \$65.50; F. W. Kiesel, Sacramento, \$58.50; Anita M. Baldwin, Santa Anita, \$48.50; J. J. Jeffries, Burbank, \$36; State Hospital, Napa, \$33.50; A. M. Bibens, Modesto, \$22.50; J. W. Benoit, Modesto, \$19.50; E. J. Weldon, Sacramento, \$19; G. A. Smith, Corcoran, \$18.25; K. W. Abbott, Ripon, \$18.25; Dean Beeman, Woodland, \$10; R. L. Holmes, Modesto, \$7.50; Los Angeles County Farm, Hondo, \$6.50. California stands fifth in the number of breeders receiving prize money, and A. W. Morris & Sons have appeared among the first twelve breeders in the United States every year for five years.

C. A. Miller of Ripon has sold a registered Holstein cow to Martin Edwards of the same place, who is just starting in the pure-bred business. Mr. Edwards has also purchased three cows from W. F. Miller, Ripon.

Rubbing Elbows with Other Breeders

(Written for Pacific Rural Press by Thos. F. McConnell.)

Berglund's Big Ones.

A gilt that weighs 512 pounds at one year old is some baby hog, and of course she is a Duroc, or Harvey M. Berglund of Dixon wouldn't have her. This bouncer was sired by Johnson's Defender, and besides being a great animal herself, has a wonderful litter of pigs.

Hogs can't help but grow for Harvey though, as he is always on the job giving them his personal attention. When the writer called he was busy cleaning out the pens and then sprinkled them thoroughly with air-slaked lime, which made them both clean and sanitary.

Mr. Berglund believes in the big type and his herd header, California Orion King, weighed 756 pounds at 2 years, after being used on 40 sows.

BOOK ON DOG DISEASES And How to Feed

Mailed free to any address by the Author

H. CLAY GLOVER CO., Inc.,
118 West 31st Street, New York

This boar not only is big, but has large bone and excellent conformation. There are very few animals that are his equal.

Haag's Hogs Make Good.

It is gratifying to observe the methods of a breeder whose chief object is to have his stock make good in the hands of purchasers. Many breeders will feed their animals to the limit and turn them over to purchasers without a word as to how they have been fed or how they should be fed. Often the result is that the animals go backward and the new owners become disgusted with pure-breeds.

But W. L. Haag, who with his son conducts the Lendorris Ranch at Hanford, believes in accustoming his hogs to common feed, such as are used on the average California farm, so that when the hogs go to new homes they will thrive. He feeds barley and milo, some middlings and very little milk. By doing this he figures that if a hog is placed on a milk ration after passing into other hands it will do well, but if no milk is fed it will not fall off.

Mr. Haag also has made a close study of the best age to breed a gilt and has come to the conclusion that the best results are obtained when a gilt is bred at from 10 months to a year old. The sows will be bigger, litters larger, and the pigs bigger and stronger. Pigs are generally weaned at from 10 weeks to 3 months, but often they wean themselves, as creepers are provided and they learn to eat at an early age. Sows that are good breeders are kept as long as productive, but if not prolific they are sold to the butcher and are not allowed to get into the hands of other breeders. The boar pigs are culled very closely and only the tops are sold for breeding purposes.

The senior herd sire, Long Jumbo, never looked better than at present. He is a strong, active fellow; very deep, has a wonderful back, and shows lots of character and quality. He will be a strong bidder for high honors if shown this fall.

Too much cannot be said in favor of the junior herd sire, Lendorris Liberty Bond. His sire is the great boar Liberty Bond, owned back in Missouri, and in the last mid-winter sale sows bred to him and Liberator made an average of \$823. An offer of \$10,000 cash was refused for him. The Haag boar seems the exact duplicate of his illustrious daddy and promises to make a great name for himself here on the coast. Sixteen of the fall gilts which will be offered at the coming Bernstein-Haag sale will be bred to him.

The 22 brood sows which make up the female side of this excellent herd are about as fine as will be found anywhere. One sow, Lorraine B, has farrowed 22 pigs during the past year and raised 21. Then there are eight yearling sows that are almost a show in themselves. They were sired by Young Jumbo and King's Big Bone Leader. Mr. Haag and his son have built up this herd by close personal attention to both breeding and feeding. Mr. Haag is very modest and claims that he is only a fruit man, but if so there ought to be more fruit men raising hogs.

Bennett Has Some Bouncer.

W. V. Bennett of Nord is a great believer in the big type Duroc-Jersey breed of swine, and he has some animals of supreme merit to back his belief. Mr. Bennett made a trip east in search of something in the swine line to better his herd, and brought back a sow sired by Barker's Premier Giant that comes near being the best anywhere. She is a sow of great size, large full ham and strong bone—an ideal brood sow.

Mr. Bennett has four other younger sows that are great types and if the State Fair was in session today he would be very apt to "bring home more bacon" than he took with him.

Alfalfa for Draft Horses.

N. W. Thompson of Patterson is a great believer in first quality alfalfa

hay as a feed for draft horses at all times. For stallions, either in active service or otherwise, it cannot be beaten. Supplemented with a little rolled barley, when animals are getting hard service, or fed alone, no deleterious effects have ever been observed by Mr. Thompson who is feeding it regularly, and has been for a term of years. There never has been any trouble with colic or kidney troubles among his stallions, and he has quite a number of young Percherons and Belgians that show in most excellent condition and are getting nothing but straight alfalfa hay. A light roan Belgian stallion, Waussux, 3 years old, and weighing over 2,000 pounds, is in excellent flesh—firm and hard, with a beautiful coat—and has not had anything but alfalfa for 90 days.

Two colts that were brought in from the range in October and fed alfalfa with a light grain ration, gained on an average 110 and 120 pounds per month respectively for 4 months, and kept in the best of condition. Mr. Thompson has no use for medicines or veterinarians. He thinks alfalfa, salt and pure clean water provide all the treatment necessary.

Lehman Likes Milking Machines.

The question is often asked, "Are milking machines a success?" The answers are many and varied. J. F. Lehman of Lodi has been operating one of the popular makes for over five years, and as he is a successful dairyman the very fact that he has continued the use of the machine method of milking for this period is a very convincing affirmative answer. To achieve this success with the machine method has meant close attention to detail and watchfulness, but there has been no injury to the cows or falling off in the milk flow; otherwise a careful dairyman like Mr. Lehman would not continue the use of the machine.

Mr. Lehman milks from 25 to 30 high-grade Holstein cows and at present he and his 12-year-old son do the milking more quickly, easily and profitably than they could by hand.

DAIRY COUNCIL ELECTS OFFICERS.

If the achievements of an organization can be estimated in advance according to the caliber of the men in its directorate, then the California Dairy Council should accomplish wonders during the coming year, for it is doubtful if a stronger body of men was ever gotten together than the new directors elected at the annual meeting in San Francisco last Wednesday. They represent all of the different branches of the dairy industry, and each man is a recognized leader in his line.

The new board is made up as follows—Breeder: A. W. Morris, Woodland; G. M. Brown, Burr Farms, Los Angeles; W. H. Saylor, San Francisco. Producers: Hon. F. J. Cummings, Ferndale; John Denman, Petaluma; Ed. H. Webster, El Centro. Milk Distributors: D. M. Dorman, Crescent Creamery, Los Angeles; C. A. Fieweger, Walnut Grove Creamery, Oakland; E. A. Green, Liberty Dairy, San Francisco. Butter Manufacturers: Geo. E. Platt, L. A. Creamery, Los Angeles; W. B. Hopkins, Petaluma Co-operative Creamery, Petaluma; C. E. Gray, California Central Creameries, San Francisco. Cheese Manufacturers: C. C. Lester, Gilroy. Ice Cream Manufacturers: F. S. Calkins, All Ice Cream Co., Los Angeles; F. H. Ames, National Ice Cream Co., San Francisco. Condensed Milk Manufacturers: H. W. Low, Hughson Condensed Milk Co., Hughson. Bankers: H. D. Swengel, Bank of Arcata, Arcata. Dairy Produce Dealers: J. T. Frietas, Pres. San Francisco Wholesale Dairy Produce Exchange. Dairy Machinery and Equipment: J. N. Gilman, De Laval Dairy Supply Co., San Francisco. At large: H. E. Van Norman, Dean University Farm School, Davis; R. H. Whitten, Livestock Editor Pacific Rural Press, San Francisco.

The directors at a later meeting elected Hon. F. J. Cummings of Ferndale president, Geo. E. Platt of the Los Angeles Creamery, Los Angeles, vice-president, and Sam H. Greene of San Francisco secretary-manager.

Suppose you were managing Swift & Company

Knowledge of the American appetite is one of the requisites of the manager's job.

Suppose you are the manager. You know that more meat is eaten in cold weather. A cold snap begins suddenly, butcher shops enjoy a thriving trade and call for meat. The rush of orders uses up your stocks. Competition among buyers sends the price up.

The next winter, when you are expecting the usual good demand along comes the influenza epidemic and people stop eating meat, leaving a big lot of perishable food on hand!

What would you have done then, if you had been managing Swift & Company? Of course you would have had to reduce prices to get rid of the meat—and taken a loss.

Demand is the queerest thing in the world.

No one ever has put his finger on it. Weather, fashion, business, all control men's appetites, and they buy what they want to eat.

These touches and flurries in different parts of the country cause the price to bob up and down like a cork and bait pulled by an excited fish.

After operating Swift & Company you would see how the public appetite for meat controls the price of live and dressed beef. You would find that the packer doesn't like these fluctuations any better than you do, and that he is powerless to stop them.

You would also find that he has to use the keenest judgment and the best of management to get his profit of a fraction of a cent per pound.

Swift & Company, U. S. A.

Founded 1868

A nation-wide organization owned by more than 25,000 shareholders

THE EXTRA PROFIT FROM PURE-BRED STOCK.

It is surprising how many beginners in the poultry business select a location with great care, and plan their buildings and equipment with as much concern as though they were erecting a lifelong home, yet when it comes to the selection of stock they place quality second to quantity and try to get as many birds as possible for their money. They spend lavishly on buildings and equipment and put what is left into stock, yet the quality of stock has ten times more to do with success than the manner of housing.

It is the height of folly to begin with cheap stock, on the theory that it can gradually be improved. It is the tendency of all kinds of livestock to retrograde in breeding, and while an experienced breeder of high-class stock can make each succeeding generation show advancement, this is a hard enough task for the beginner when he has birds of real quality. To do it with birds of an unknown ancestry is a hopeless task, and the idea that it can be done is a delusion that has sent many well-meaning poultry raisers upon the rocks of failure.

I don't mean that a beginner should merely be particular to have all birds

while the latter are simply bred for utility purposes. Their way of putting it is that all standard-bred birds are pure bred, but not all pure-breds are standard bred.

But I take exception to this statement, for barring the exceptional case which proves the rule, every breeder is inclined toward the standard. To illustrate: You start in the poultry business and decide to aim for heavy egg production, so you purchase utility stock. But in selecting the birds you are mighty particular to pick out the best looking ones, and this is your first step toward the standard, for the fancy points are simply those that please the eye.

Then when you get the birds home you take pride in showing them to your friends, and you delight in pointing out certain ones that look particularly good. Second step toward the fancy end.

Then, when you mate up your breeding pens, even though you have trapped and have selected only heavy layers for breeders, you pick out the best looking birds and put them in pen No. 1, put next best in pen No. 2, and so on. And you charge more for eggs from pen No. 1 than those from pen No. 5, even though the hens may not have any better egg-laying records. Another inclination toward standard breeding.

A utility bird is one that answers every practical purpose, and certainly one practical purpose is to please the eye. For if you don't like the looks of your birds you can't love them; without love you will never give them proper care; and without proper care they will never pay for their keep, no matter how well they have been bred for business qualities.

Consequently, as every breeder should—and actually does, either consciously or unconsciously—breed toward the standard, there is no need of these two terms, and I use pure-bred to include birds pure in blood and bred for both show and heavy laying qualities.

Furthermore, the egg-laying contests have proved that the bird of the best show type makes the best layer. At one of the Missouri contests the heavy producing hens of all breeds were put in one group, and the low producing ones in another, and all were scored by a licensed judge. The hens of the first group, which averaged 222 eggs per year, scored 89 1/4 per cent, even though cut heavily on weight, because of the effects of their heavy laying. Those of the second group, with an average of only 101 eggs per year, scored only 62 1/2 per cent. Something to think about if you are starting in the poultry business. It is highly important that you get the right foundation stock, for your success will depend more upon it than upon any other factor.

Just figure it out. Suppose you can buy a utility pen of one male and eight females for \$25, but will have to pay \$75 for a pen of high-class pure-breds. Suppose you hatch for only four months of the year. You will get about 480 eggs, 400 of which will be good enough to use for hatching. Suppose you get only a 50 per cent hatch—200 chicks—and, allowing for losses and culling, you get only 150 mature birds.

The veteran poultry breeder, I. K. Felch, collected data to prove that the difference between pure-bred and common stock averages \$5.75 per bird, but let's be very conservative and put the figure at \$2.50. As you have 150 birds, this means that if they are pure-breds they will be worth \$375 more than if they are common stock. I won't continue to show what the difference will be in the second and third years. This increase of \$375 in profit for one year on an investment of \$50 is enough to convince any man who has enough brains to make a success of the poultry business that it will pay him to start with high-class, pure-bred stock.

It costs no more to raise pure-

breds than it does to raise common stock. In fact, it actually costs less, for statistics show that they produce more eggs per hen per year at a less cost of feed per egg. Furthermore, the eggs are more uniform in size, shape and color, thus commanding the highest market price.

Pure-breds are more hardy and less susceptible to disease, so risk and loss are reduced to the minimum. They are more prepotent; their eggs more fertile; there are fewer weak germs, and more eggs hatch. The chicks are more vigorous; they grow more rapidly, mature more quickly, and begin laying earlier. Pure-breds breed more true to type; consequently, there is less culling, and there are a larger number of birds that may be sold at fancy prices.

So, if you are thinking of taking up poultry raising, plan to buy the best foundation stock obtainable.

Poultry Breeders' Directory

DON'T BE TOO LATE BOOKING fall chicks, reduced. Get ready for high-priced broiler, roaster holiday trade. Seven varieties clearing customers \$5.00 yearly. 200-290 egg strain. Chicks every week in year. 70,000 capacity hatcheries supplying chicks. All booked some weeks. **HUNDREDS LAYING PULLETS**, breeding hens, roosters, reduced July, August. The good qualities of a purebred bird like this one become fixed characteristics, and they are transmitted to the offspring with reasonable certainty.

in a pen of the same color and general shape—apparently of the same breed. I give every right-minded person credit for having enough brains to know that nothing can ever be accomplished with a dung-hill flock—with birds of every conceivable color and shape. But there are many to whom all birds of the same general appearance are of equal value.

Yet what a difference in real worth there may be in birds that appear the same to the casual observer! Take two White Rocks, for example—one raised by a breeder who understands proper mating and has line-bred for many generations, and the other raised by an amateur who has simply put "fine specimens" together. Even though they are equally good in type, color and fine points, and lay equally well, the first will be almost worth her weight in gold as a breeder, while the second will be of practically no value. Why? Because the first hen has her good points bred in her, and, if properly mated, can be depended upon to transmit them to her offspring, while the second got her good points by chance and there can be no certainty about the quality of her descendants.

Fowls should be grouped under three classifications: Mongrels, grades and pure-breds. Mongrels are the result of indiscriminate mingling of different breeds—birds of every conceivable color, size and shape. Grades are birds carrying enough of the blood of a certain breed to give them the general color, shape and characteristics of the breed. Pure-breds are the result of years of selective breeding of one particular breed, without the mixing of blood of any other breed.

Some persons make another classification—standard-bred birds. Their distinction between standard-bred and pure-bred fowls is that the former are selected and bred for fancy points

THE HOME CIRCLE

HIS DOG.

I surely sniff excitement in the air—
Perhaps he's coming home! If I
could know!
But up and down the street, and
everywhere
I've watched about a hundred years
or so;
Yet somehow I expect him, any day
With shouts and cheers, as when he
marched away.
And when I hear that whistle! and
you see
A streak of dog, in frenzied hap-
piness—
You'll understand! He'll pat my head
and say:
"Hello, old Pal! you missed me
some, I guess!"
I leap to kiss his hand—and then—
oh, boy—
I wonder if a dog can die of joy?
—Laura Simmons in "Life."

USES OF A FIRELESS COOKER.

How many of our readers realize the advantages of a fireless cooker? Not only the saving of fuel, but the added comfort to the housewife and the greater leisure for other things, are factors to be considered in the economy of the home.

For foods that require long, slow cooking, or where one's personal attention is not necessary, the fireless cooker is invaluable. Particularly pot roasts and the cheaper cuts of meat will be found most tender and delicious, retaining the natural flavor, and are more delicate to the discerning palate when cooked the fireless way. Breakfast cereals, grits, rice, etc., are far more delicate and possess a "nutty" taste when cooked overnight by the fireless. These foods, above all others, cannot be hastily prepared for the table; and the housewife who will rise in the wee sma' hours to start the oatmeal cooking an hour, or so before time to begin the regular breakfast is indeed a rara avis. In fact, it "isn't done," you know. This is where the cooker is of such inestimable value; it cooks while you are doing something else,—either taking the extra forty winks before beginning the day's duties, or busied about other details of house-keeping.

Foods may be roasted, baked, steamed, stewed and boiled in the cooker. The classes of food best adapted to the cooker are cereals, soups, meats, vegetables, dried fruits, steamed breads and puddings. A good plan is to prepare the vegetables the evening before, and then start them cooking on the stove while getting breakfast. When they get to boiling "hard," place them in the fireless cooker with the lid of the container firmly fastened down, as well as the lid of the cooker itself.

The recipes for dishes to be prepared in the fireless cooker differ somewhat from those for foods cooked in the ordinary way, chiefly in the amount of water or other liquids

called for. Less liquid should be put into the food to be prepared in an ordinary fireless cooker, since there is no chance for water to evaporate. The cook must be guided largely by experience in deciding how long the food should be heated before being put into the cooker and how long it should be allowed to remain there.

After a bit of practice, a whole dinner can be prepared and put into the cooker, and the housewife's responsibility concerning the dinner are at an end until it is time to serve the meal on the table. Stirring, basting, turning and watching the dinner are all unnecessary, and there need be no fear of a burned or overdone meal. Indeed, one may go away for the day, shopping or visiting, with the greatest assurance that when she returns home in the evening, there will be a well-cooked, wholesome, hot meal ready for the family to sit down to.

The added comfort of a cool house in the summer time, which is made possible by the use of a fireless cooker, is another of its many advantages, and is a big factor to be taken into consideration when one realizes that a cool house, particularly the kitchen, lessens fatigue and a waste of nervous energy, thus contributing to the better physical being and comfort of the cook, as well as the greater comfort of the entire household. This certainly is not possible with a coal or wood stove.—Z. D. H.

A COVER FOR THE REFRIGERATOR TOP.

The handiest place to set bottles, dishes and other food containers as they are being taken out of the refrigerator is, of course, on top of the refrigerator.

The result is always disastrous to the finish of the top because the articles placed thereon are moist and tend to spot and destroy the varnish.

Every woman knows that a milk bottle left for sometime on a refrigerator top is likely to leave a circular mark where the varnish has become discolored by moisture. The same effect results from various similar causes.

At almost any large department store a piece of good-looking leather substitute or of rubber-coated cloth can be bought with which the refrigerator top can be covered. Either of these materials is perfectly waterproof and will protect the refrigerator top and preserve its original beauty.

Leather substitutes can be had in almost any color and in beautiful leathery grains, so that a cover of this kind is really an ornament to the kitchen or pantry or wherever the refrigerator may be.

FIG FANCIES.

(By permission of the J. C. Forkner Fig Gardens, Fresno.)

Easy Enough Jam.—Six pounds of purple figs (fresh), peeled and cut in half; two pounds of sugar. Cook until thick and seal hot.

Fig Jelly.—Slice the fresh figs into the preserving kettle, covering bottom of kettle with cold water. Add slices of unpeeled lemon, one lemon to one and one-half pints of uncooked figs. Place on back of stove to cook slowly an hour; then strain and boil for fifteen or twenty minutes (according to the state of the syrup), adding three-fourths quantity of sugar to that of the fruit.

Bennett Spices.—One-half gallon of medium-sized Smyrna (Calimyrna) figs; make a syrup of vinegar, one cup to three cups of sugar; add spices of a mixed variety as desired; boil this and drop in the figs whole; let boil gently for a few minutes; then let remain in syrup twenty-four hours; repeat and seal.

Germes which grow in food and cause illness, grow very rapidly, and are de-

stroyed by being well cooked. Warming up is not enough.

Replace Your Old-fashioned Plumbing Fixtures

The added convenience of modern plumbing fixtures will more than compensate you for the slight cost involved in replacing them for your present fixtures.

The attractive designs of Pacific Plumbing Fixtures will make you proud of your bathrooms. Pacific Plumbing Fixtures are guaranteed forever against any defects in workmanship or materials, and although their quality is higher, cost no more than any other reputable brand.

DREADNAUGHT

BLAZING AWAY IN COST-DEFENCE!

"EXTRA DRY"

Dry Gas means more heat—more for your money. That is what the little square gas chamber on a Dreadnaught does. The gas is first lifted straight up—compelled to travel farther, hesitate in the drying chamber on account of the smallness of the gas hole, then shoot to complete combustion on top of the base. It is the dryness of the gas that makes possible the smallness of the hole.

Thus the simple little square block does wonders—it makes perfect that which would otherwise be imperfect, for wet gas is an unfinished product, expensive and trouble making.

"Best by Test" is the watchword of Dreadnaught construction and it costs no more to have the best. You can apply the Burner to any stove, cut down expense and labor, have the cleanest of gas fires and forever eliminate all fuel problems. Let us tell you more—write for circular. All questions promptly answered.

Market Comment

Hops Break Recent Records.

A contract was closed at Salem, Ore., last week for 300 bales of 1919 hops at 50 cents a pound. The sale was for export account. Sonoma county hop growers are holding their crop at around the same figure.

Likes Our Apples but Not the Price.

It is reported that Europe balks at paying 21 cents for California's dried apples. As there is practically no carry-over and a strong domestic demand for this article, it looks as though Europe must pay the price or face a fruit famine.

Ban on Wine Not Feared.

Prohibition has no present terrors for the wine grape growers. Around Lodi buyers are freely offering \$25 a ton for black grapes, without reference to prohibition legislation now enacted or pending.

The Butter Market.

Trading in butter locally has been rather quiet the past week, and stocks on hand show some accumulation. There has been a further decline in the important markets of the East, and general weakness prevails. There is little speculative buying.

Barley Futures Strong.

Thirty-eight hundred tons of barley were sold at \$3.06 per hundred-weight in one day this week on the San Francisco Grain Exchange for December delivery. The buyers evidently believe barley will go above that figure in December or thereafter.

Dried Fruit to the Fore.

Following are this week's quotations on dried fruits at New York. Reads like an iridescent dream: Evaporated apples—steady; Western, 20¢@22¢; prunes—California, 9¢@32¢; apricots—choice, 30¢; extra choice, 32¢; fancy, 35¢; Peaches—Standard, 23¢; choice, 24¢; fancy, 26¢; raisins—loose Muscatels, 13½¢@14¢; choice to fancy seeded, 12½¢@16¢; seedless, 15¢@22¢.

Modern Maud Mullers.

Girls are being paid as high as \$4 a day for work in the harvest fields in the Elko (Nev.) district this season. Last year they were paid as high as \$3.50. One farmer employs five girls. They do all kinds of work in the fields except stacking and do it well. But while the public applauds this generous rate of pay for our girls, they scowl repellingly when asked to recognize this payment in meeting advanced prices.

Blackeyes, 4½ Cents.

The price of blackeye beans was opened last week at 4½ cents a pound by the directors of the pool formed to handle the crop near Santa Ana. The 4½-cent price is relied on to stabilize the market. California Small Whites have weakened at shipping points to \$6.25-\$6.40. California Limas are still holding at \$9.00 per cwt. at shipping points and were steady also in consuming markets at \$9.00-\$9.50.

Hog Prices Higher and Still Climbing.

A new record price was established at Chicago this week when hogs sold at \$22.80, and at the same time packers predicted that the price would go to \$23. The important fact in this connection is that prices have not gone up because of a hog shortage, but, in the face of very heavy receipts, the demand has been greater than the supply. Practically all doubts as to the probable future of the pork market have been dispelled since the return from abroad of Thos. E. Wilson, the Chicago packer. "The thing that impressed me most," he says, "was the fact that there is an enormous shortage of fats. Everywhere we went this was evident, and it is the principal reason why Europe is so interested in our hog market." "Argentina is selling beef to Europe cheaper than the quotations in the United States," says Mr. Wilson, "but America has no competition in the export of hog products, and I believe that Europe needs such quantities of hog products, especially fats, that she will be forced to buy heavily from us for some years."

THE MARKET REPORTS

Figures Given Are Independent and Reliable.
Prices Quoted as Paid to Producers.

SAN FRANCISCO.

Sau Francisco, July 9, 1919.

WHEAT.

Little demand for California wheat this week lowered the price to \$3.67½ and \$3.75. There is very little early Baart and its price is nominally unchanged.

Per bushel—	
No. 1 hard	\$2.20
No. 2	2.17
No. 3	2.13
No. 1 soft	2.18
No. 2	2.15
No. 3	2.11
Club or Sonora, No. 1	2.18
do, No. 2	2.13
do, No. 3	2.09
Re-cleaned, per cwt.—	
California	\$3.67½ @ 3.75
Early Baart	\$4.15 @ 4.20

BARLEY.

The shipments abroad are rapidly taking care of the barley of the State and the grain continues to gain strength, although the local demand shows no increase.

Feed	\$3.00 @ 3.05
Shipping	\$3.10 @ 3.15

OATS.

The price of oats is governed entirely by the price of barley in the absence of any particular demand. As barley users turn to oats for a substitute the latter grain shows an advance in quotations.

Red feed, per cwt.	\$2.70 @ 2.75
Red for seed	Nominal
Black for seed	Nominal
Re-cleaned Red or Black for seed	Nominal

CORN.

Corn continues to be quiet, with a fair demand at previous quotations.

California	\$3.30 @ 3.50
Egyptian, choice	Nominal
Milo	Nominal

HAY.

The holidays the latter part of last week temporarily held up receipts of hay in this city, and it might be said that there was practically no market at all this week. A few buyers secured some hay for immediate needs, but otherwise the market was quiet.

No. 1 Wheat, per ton	\$15.00 @ 17.00
No. 2 Wheat, per ton	12.00 @ 14.00
Choice Tame Oat, per ton	15.00 @ 17.00
Wild Oat, per ton	10.00 @ 12.00
Barley Hay, per ton	\$11.00 @ 13.00
Alfalfa, per ton	14.00 @ 16.00
do, new, 1st cutting	
Stock Hay, per ton	9.00 @ 11.00
Barley Straw, per bale	.50 @ .80

FEEDSTUFFS.

Feedstuffs follow the hay market to a certain extent with prices modified by changes in whole grain prices. While the market was quiet this week, quotations on rolled barley and rolled oats were materially advanced in sympathy with the advances in the whole grain. The market is practically bare of middlings, with a falling off in the supplies of shorts.

Bran	\$45.00 @ 46.00
Shorts	48.00 @ 50.00

Special Livestock Market Report

San Francisco, July 9, 1919.

CATTLE—The sharp depression in cattle values has become so acute as to seriously threaten the interests of cattle raisers. There is little activity in the beef cattle market here, owing to the wide divergence of opinion between buyers and sellers. The following shows the decline in the prices of cattle on foot from March 1, 1919, to July 1, 1919, on the Chicago market: Prices of medium and good beef steers on foot exhibit a mean decline of 14 per cent between the dates mentioned. Prices on choice and prime beef steers on foot exhibit a mean decline of 23 per cent. While prices here remain unchanged, the quotations are nominal. Record prices prevail in the calf market.

Steers—	
Grass Steers, No. 1, weighing 950 @ 1100 lbs.	10 @ 10½¢
Grass Steers, No. 1, weighing 1100 @ 1300 lbs.	9½ @ 10¢
Grass Steers, thin	6 @ 7¢
Grass Cows & Heifers, No. 1	8 @ 8½¢
Grass Cows & Heifers, No. 1 8 @ 8½¢	
Grass C & H, 2nd quality	6¾ @ 7¼¢
Grass Cows & Heifers, thin	4 @ 5½¢
Bulls and Stage, good	
do, fair	
do, thin	
Calves, light weight	12½ @ 13¢
do, medium	11½ @ 12¢
do, heavy	10 @ 11¢

SHEEP—The sheep and lamb market is but little disturbed. The consuming demand at the prevailing quotations is fairly active, and the high prices of wool, present and prospective, render the sheep-raiser too independent to force his stock on an unfavorable market.

Lambs, yearling	10 @ 10½¢
do, milk	13 @ 13½¢
Sheep, wethers	9¾ @ 10¢
do, ewes	7½ @ 8¢

HOGS—The record and ultra-record prices registered for hard, grain-fed hogs in the Eastern markets of \$22.70 per cwt. is somewhat of a sensation. Local buyers are somewhat averse to recognizing these rapidly rising values, but have been forced to mark up quotations one cent on all grades.

Cracked corn	72.00 @ 73.00
Roller barley	62.00 @ 63.00
Roller oats	56.00 @ 58.00
Alfalfa meal	33.00 @ 35.00
Cocunut meal	48.00
Oil cake meal	71.00 @ 72.00

POTATOES, ONIONS, ETC.

Potatoes were heavy and somewhat lower this week, the market being adversely affected by the holidays. Onions, however, remained firm at last week's figures. New sweet potatoes are now coming on the market. Bay cucumbers are becoming plentiful. Summer squash from Alameda is also on the market and brings about twice the price of the southern product. Besides the southern tomatoes Merced tomatoes are now coming in. They are of good quality.

String beans	5 @ 6¢
do, Garden	10¢
Peas	7 @ 9¢
Carrots, per sack	\$1.50 @ 1.75
Rhubarb, Strawberry, box	\$1.50 @ 2.00
Cucumbers, hothouse, box of 30	\$1.50 @ 2.00
do, Los Angeles	50 @ 75¢
do, Bay	\$1.00 @ 1.25
Eggplant, box	\$1.50 @ 1.75
Lettuce, per crate	75¢ @ 1.25
Celery, crate	Nominal
Tomatoes, Southern, per crate	.75 @ 1.25
do, Merced	\$1.00 @ 1.25
Sprouts	.50 @ 60¢
Summer squash	\$1.00 @ 1.25
do, Alameda	\$1.00 @ 1.25
Green Corn, Alameda, sack	\$4.00 @ 4.50

Potatoes—	
Oregon	2.25 @ 2.50
Idaho	\$2.10 @ 2.35
Garnets, new on street	\$2.25 @ 3.25
Other new on street	\$2.75 @ 3.25
Sweets, new, lb.	6 @ 7¢

Onions, Warehouse Stock—	
Australian Browns	Nominal
Onions, new red	\$3.50 @ 4.00
yellow	\$3.75 @ 4.25
Green Alameda	\$1.50 @ 1.75
Garlic	.15 @ 16¢

BEANS.

The demand for blackeyes continued this week and some demand for large whites was added to it. The bean men are anxiously watching the bean bag market, which is showing unusual strength. Prices for large bean bags advanced from 14 to 15 cents this week, and the small bags advanced from 11½ to 12½. Bagging material is said to be scarce, and may go higher.

Bayos, per cwt.	\$5.90 @ 6.10
Blackeyes	\$4.25 @ 4.50
Cranberry beans	5.75 @ 6.00
Limas (south, re-cleaned)	\$9.00
Pinks	\$5.50 @ 5.75
Mexican Reds	4.50 @ 5.00
Tepary beans	2.50 @ 2.75
Garbanzos	11.75 @ 12.00
Large whites	\$5.85 @ 6.00
Small whites	6.75 @ 6.90

POULTRY.

While the poultry dealers remained open on last Saturday, the holiday the previous day took the vim out of the market and but little was done. This week the market opens up somewhat stronger, although there are but

few changes in prices. Small broilers show an advance, as do Belgian hares, while young roosters and jack rabbits are off in their quotations. While the rest of the list is unchanged it is expected that there may be slight advances in several descriptions in the near future. This gives a tone of strength to the entire market.

Turkeys, live, young spring, lb.	Nominal
Broilers, 1½ lbs. and under	33 @ 34¢
do, 1½ to 2 lbs.	32 @ 34¢
Fryers, 2 to 3 lbs.	35 @ 38¢
Hens, extra, per lb. colored	10 @ 32¢
do, Leghorn	10 @ 28¢
Smooth young roosters, per lb. (3 lbs. and over)	22 @ 45¢
Old roosters, colored per lb.	22 @ 23¢
Geese, young, per lb.	20 @ 25¢
do, old, per lb.	20 @ 25¢
Squabs, per lb.	30 @ 48¢
Ducks, young	25¢
do, old, per lb.	25¢
Belgian hares	13 @ 15¢
Jack rabbits	\$1.50 @ 3.00

BUTTER.

The local exchange remained closed over Friday and Saturday last week and this week opened up with a decline of 1½ cents for extras. Yesterday showed a gain of a cent but today the market again touched 51½ for extras. The receipts at San Francisco have been normal for the past week.

	Thurs	Fri	Sat	Sun	Tu	Wed
Extras	53		51½	52½	51½	51½
Prime firsts						None
Firsts	49½		48½	48½	48½	48½

EGGS.

The local receipts of eggs taking the average of the holiday arrivals were just about normal. However extras have shown a certain amount of weakness, and while the close was strong on Wednesday, the price was at a lower figure than for any day during the previous week. On the other hand, extra pullets showed good strength and close at the highest price for the two weeks. The warm weather sent more eggs into storage during the past week than would normally have gone to the ice houses, but even at that the amount in storage is less at this time than a year by nearly 12,500 cases.

	Thurs	Fri	Sat	Sun	Tu	Wed
Extras	47		47½	48	48	48
Firsts						Nominal
Ex. pullets	40		41½	43	43	43

CHEESE.

Trading in cheese continues to be light and the only change in quotation is a gain of half a cent in fancy California flats. There have been receipts of cheese from several outside States during the week.

Fancy California flats, per lb.	20¢
do, Firsts	27¢
California Y. A., fancy	31½¢
Oregon Y. A.	31½¢
Oregon Triplets	34¢
Monterey cheese	22½ @ 24¢

FRESH FRUITS.

New Red Astrakhan apples are becoming plentiful, selling at 75 cents to \$1.25 for lug boxes and \$1.50 to \$2 for California boxes. The berry market is firm with slight fluctuations in prices. Cherries are getting more expensive as their season draws to a close. A considerable shipment of cantaloupes has arrived.

California apples	\$3.00 @ 4.00
Northwest apples	3.00 @ 4.00
do, New Red Astrakhan, lugs	75¢ @ 1.25
do, California, boxes	\$1.50 @ 2.00
Peaches	.40 @ .75
Apricots	\$1.00 @ 1.50
Plums	1.25 @ 1.75
Figs	.50 @ 65¢
Strawberries, chest	\$11.00 @ 14.00
Raspberries	\$12.00 @ 15.00
Loganberries	\$8.00 @ 10.00
Blackberries	\$8.00 @ 12.00
Currants, chest	10.00 @ 13.00
Gooseberries	6 @ 8¢
Cherries—	
Royal Anne	10 @ 15¢
Black, bulk	15 @ 18¢
White, bulk	9 @ 14¢
Cantaloupe, Standards	\$2.50 @ 3.00
do, Ponies	2.00 @ 2.50
do, flats	1.00 @ 1.25
Watermelon, lb.	2 @ 2½¢

CITRUS FRUITS.

The entire list is showing great strength, lemons being especially in demand. Some fancy are said to have sold up to \$8. Oranges are 25 cents higher for the fancy, while grapefruit is strong at last week's prices.

Oranges, Valencia	\$3.50 @ 5.25
Lemons, fancy	\$7.00 @ 7.50
do, choice	6.00 @ 7.00
do, standard	5.00 @ 6.00
Lemonettes	4.00 @ 5.00
Grapefruit	3.50 @ 4.25

DRIED FRUITS.

The market for dried fruits continues strong. The apple growers are demanding higher prices for their crop and the dealers have advanced the price a half-cent.

Apples	18 @ 18½¢
Pears	18 @ 20¢
Peaches	14 @ 15¢
Apricots	23 @ 29¢
Prunes	13 @ 15¢
Figs, Adriatic	14 @ 18¢
do, Calimyrna	15 @ 20¢

RICE.

The advances in the price of rice are expected, although this week's quotations for Paddy and 12c for fancy Japan, are the same as last week. When the mills were through milling the undamaged portions of the crop and possession of better grades of rice had passed into the hands of dealers, prices immediately advanced. There has been a great activity on rice at the advanced prices.

HONEY.

Some small lots of sage honey have been shipped to this city and the dealers paid as high as 18 cents for it. The demand at this price, however, is small.

Water White, Orange Blossom	18¢
White to Water White, sage (Subject to production)	18¢
Light Amber Mountain (Sage-Buckwheat)	14¢
Light Amber Alfalfa	11¢

LOS ANGELES.

Los Angeles, July 8, 1919.

BUTTER.

This market is still showing a slight decline. A drop of 1c is noted since last, but reported selling fair. Demand is holding up well. Receipts for the week, 327,700 lbs. California extra creamery 54c
do. extra first 52c
do. first 51c

EGGS.

Case unit drops 1c but other prices remain unchanged since quoted a week ago. The market is active and firm. Receipts for the week, 1411 cases.

We quote:

Fresh ranch, extra 51c
do. case count 49c
do. pullets 44c

POULTRY.

The demand is good for broilers, fryers and heavy hens, and market is quoted higher. Light hens dull and lots coming in. Turkeys and ducks reported slow sale, but unchanged.

Broilers, 1 to 1½ lbs. 25c
Broilers, 1½ to 1¾ lbs. 29c
Fryers, 2 to 3 lbs. 32c
Roosters (soft bone), 3 lbs. and up 30c
Stags and old roosters, per lb. 14c
Turkeys 27@33c
Hens 22@28c
Ducks 23@26c
Geese 25c

FRUITS.

Cherries advance while gooseberries decline in price. Apricots higher. Strawberries quoted cheaper and Loganberries mark sharp advance. Blackberries also higher. Grapes now coming in and quoted on the local markets. There is a good demand for all fruits and receipts are normal.

We quote from growers:

Cherries, lb. 15@25c
Gooseberries, lb. 7@9c
Apricots, lb. 5@6c
Strawberries—
30 basket crates, fancy \$3.50@4.00

BEANS.

This market is still very dull, but all prices remain as quoted last week. Even limas are neglected in movement.

Limas, per cwt. \$8.00
Large white, per cwt. 6.25
Pink, per cwt. 6.50
Small white 6.25
Blackeyes, per cwt. \$3.50@3.75
Tepary, per cwt. \$2.00@2.50

HAY.

All prices in this market unchanged from a week ago. It is dull, but some light activity in alfalfa. Grain hay reported not wanted, but receipts are fairly good.

We quote f. o. b. Los Angeles.
Barley hay, per ton \$18.00@21.00
Oat hay, per ton \$20.00@22.00
Alfalfa, Northern, per ton \$20.00@22.00
Alfalfa, local, per ton \$21.00@23.00
Straw, per ton 9@10.00

ALFALFA GROWERS OF CALIFORNIA, INC.

The following quotations are furnished by the Alfalfa Growers of California, Inc., 525 Central Building, Los Angeles, Cal., for the week ending July 8, f. o. b. cars Los Angeles.
No. 1 Dairy, ton \$26.00
Standard Dairy \$22.00@23.00
Standard Alfalfa 18.00@19.00
Stock Alfalfa \$12.00@16.00

Barley and bean stocks are almost four-fold greater this year than they were a year ago in California. There has been a substantial reduction in the amount of barley in the State, however. On December 1, 1918, there were 7,719,320 centals, compared with 1,632,180 on hand in June 1, 1919. The decrease in the bean holdings were not so great, and there are still more than 2,000,000 sacks of this commodity in California.

Special Deciduous Market Report

(Written for Pacific Rural Press by J. L. Nagle.)

Sacramento, July 8, 1919.

With an unusual pre-holiday demand last week, we anticipated a lower market after the Fourth, but trading continued active on all varieties except peaches, the market on which in nearly every instance was affected by shipments from Georgia, Texas, Oklahoma, and other local home-grown varieties. Eastern fruits, with the exception of late shipments from Georgia, are not arriving in good condition or giving satisfaction, and there has been a noticeable advance in the California peach market during the past few days.

Plums are holding firm, despite heavy receipts. Fruit is arriving in good condition and the quality is exceptional this season.

Cherry and apricot shipments are completed and the sales gradually cleaning up.

Bartlett Pears are moving under heavy supply, the warm weather during the past week having a tendency to advance the crop. The trade seems to be eager for Bartletts, and despite the fact that the shipments will continue heavy for the next three weeks, we look for all markets to remain firm and the Eastern prices will equalize those offered by the canners.

Early Thompsons and Malagas from the Imperial and Coachella Valleys are arriving; in the East and selling at the highest prices in the history of the industry. The market on grapes will, naturally, be affected by increased offerings but regardless of this, we anticipate a very strong demand for Tokays and Malagas throughout the season.

There is some discussion as to the movement of wine grapes and inquiries are numerous, at prices considerably higher than a week ago, for Zinfandels and Missions. A few actual sales have been closed at \$50.00 a ton, but growers

are holding for higher prices, anticipating Congressional action in favor of the manufacture of wine. It is conceded, however, that even if permission to ship wine grapes is granted, but less than half of the crop will be marketed on account of the scarcity of shooks and the inability of the carriers to furnish equipment in view of the heavy demand for refrigerator cars for other varieties.

We cannot see at this time any reason why all markets should not remain firm on practically all varieties, for the balance of the season, and we anticipate an advancing market on peaches, beginning about the 20th of July. On account of the unprecedented demand for canned goods throughout Europe and South America, a large proportion of the California peach crop will be canned by consumers, which will force an active demand, in preference to Eastern peaches. Inquiries in this connection are becoming numerous.

Averages for the week:

NEW YORK: Formosa Plums, \$2.91; Beauty, \$2.14; Climax, \$2.38; Clyman, \$1.70; Tragedy, \$3.12; Burbank, \$2.16; Santa Rosa, \$2.55; Comet Pears, H-B, \$3.60; Wilders, H-B, \$2.37; Lawsons, H-B, \$3.75; Thompson Seedless, \$4.17; Peach Apricots, \$2.45; Royals, \$1.81; do, lugc, \$2.38; Alexander Peaches, 96c.

CHICAGO—Eulatis Peaches 80c; Hales, 80c; Alexanders, 87c; Triumphs, 96c; Thompson Seedless, \$4.60; Royal Apricots, \$2.17; Climax Plums, \$2.07; Beauty, \$1.75; Burbank, \$1.90; Tragedy, \$2.75; Clyman, \$1.59; Santa Rosa, \$2.46; Formosa, \$2.04; Red June, \$1.69; Calif. Blue, \$1.90; Abundance, \$1.57.

BOSTON: Royal Apricots, \$1.34; Triumph Peaches, \$1.00; Alexanders, 95c; Climax Plums, \$2.60; Beauty Plums, \$2.26; Clyman, \$1.72; Formosa, \$3.05; Burbank, \$1.90.

UTILITY TRAILERS

Source of Profichi Figs For Caprification

Written for Pacific Rural Press by John J. Fox.

REMARKABLE CLUSTER OF CAPRI FIGS was brought to our office last week by G. P. Rixford of the U. S. Department of Agriculture from the famous Maslin orchard. The death last week of E. W. Maslin, formerly of Loomis (Placer county) of recent years employed in the San Francisco Custom House, recalls the early controversy about caprification.

In 1885 Dr. Gustav Eisen was the only man in California who recognized the need of caprification of the Smyrna fig. In 1886 Mr. Maslin sent to New York for a box of imported figs of the best quality—Imperials—and the seed from these figs, by arrangement, were sown by the gardener at the State Capitol and raised in a hot-house. In 1887 the young trees from these seeds were set out in orchard form, 25 feet apart, hexagon style, on Mr. Maslin's ranch at Loomis. Of these seedlings, 147 are still alive and 139 are bearing trees.

The Blastophaga Needed

These seedlings turned out, as might naturally be expected with our later knowledge, to be one-half Capri and one-half Smyrna (female type). In 1891 Mr. Maslin's experiments and research being without results, he disposed of the ranch as unprofitable, and for more than ten years the orchard was given no care. Professor Walter T. Swingle sent the Blastophaga to Geo. C. Roeding in 1899 from Algiers, who introduced them into this orchard, sending the profichi full of the insects from his ranch at Fresno. From this time on the Smyrnas bore regularly and there were plenty of Capri figs to colonize and carry over the insects. The orchard was rented for two years by George C. Roeding for this purpose.

Growers of Smyrna Figs Encouraged.

The U. S. Bureau of Plant Industry leased the Maslin orchard in 1908 to place the Capri figs at the disposal of Smyrna fig growers. The orchard has been controlled by the department since that time and each year the figs are distributed to growers who are not provided. Practically all the trees are different in the Maslin orchard, which contains many valuable varieties of the Capri, especially those producing mammas—the overwintering ones. They are furnished by the Department at actual cost of picking, packing and shipping.

Figs Distributed This Year.

This year they have been distributed by G. P. Rixford at a cost of about 60 cents for a box containing from 150-160 figs. These profichi (now distributed) ran up to 2½ inches in diameter and carried a correspondingly large number of insects and good staminate clusters.

Co-operative Orchards.

It will be seen then that the Maslin orchard has played an important part in the Smyrna fig industry of the State. The Department has been

giving away cuttings of the best Capri figs for over ten years—gratis. There are 65 varieties in the Loomis orchard. No varieties have been distributed in the ten years, that failed to carry the overwinter or mammas crop. The department, Mr. Rixford says, has advised growers for years to plant a co-operative orchard of different varieties of Capri figs—from the earliest to the latest—in some frostless section for the reason that the crop is frequently curtailed by frosts. Such an undertaking would give a number of men their annual supply of Caprifying figs at a nominal figure.

The demand for Capri figs this year has been abnormal. Ten dollars a

thousand seemed to be the most reasonable price for good figs; \$12.50 was not uncommon, while early in the season the writer heard one provider mention \$25 a thousand. This seems to be due to these factors: (1) A large acreage of Smyrnas is coming into bearing for which an inadequate supply of Capris have been provided, many owners relying on some mysterious source for a supply when they might become necessary. (2) The phenomenal price of figs has created an extra demand for Capris, so that the Smyrna growers may be supplied with an adequate number beyond all question. (3) Some growers are now Caprifying their Adriatics to see if the quality and weight are not improved thereby.

G. P. Rixford of the Bureau of Plant Industry, and who first introduced the Smyrna fig into the United States, said he had never seen such a large cluster of Capris as the one he showed us—thirteen, and all large figs. He pointed out that the time had come in the new large development of the fig industry when every grower should be interested in providing in some definite way for his own requirements in Caprification. Every grower of Smyrna trees knows his needs perfectly well, but not all of them, especially those whose young orchards are coming into bearing have made anything like adequate provision to meet their requirements. Some men are grafting over a few of their old trees to Capris to do this. To others—especially new men, a Capri is a Capri, and its seasonal qualities are not considered. A commercial

orchard should be provided with Capri trees from the earliest to the latest to obtain the best results.

And the larger the Capri figs are the more insects they contain. We find that a number of people are figuring on Caprification to improve the set or quality of their Adriatic, Kadota and Mission Figs, although these are not at all dependent on it for maturing heavy crops. W. Sam Clarke of Sultana, the well-known Kadota fig grower, caprifies the second crop of Kadotas, which he says produce a dried article second only to the choicest of Smyrnas. Upon the activities of the tiny insect, Blastophaga psenes, the Smyrna fig industry depends; and the Blastophaga in turn is dependent on the Capri crop of mammas and profichi figs. Much remains to be learned about handling and Caprifying figs.

This cluster of Capri figs is remarkable for the number and size of the fruit. Such a number (13) has never been observed before in one cluster on any Capri tree.

EDITORIAL.

CAN THE FARMER STOP THE CLOCK?

It is not much of a job to stop a clock. If it is a clock of the old pendulum variety, it can be done by a very slight shake of the shelf on which it rests, and if it is of the new main-spring kind, which will still keep ticking even if it is kicked around until the face is knocked to pieces, it can be stopped by letting it alone for a few hours or days. And yet although these things are true, one of the uppermost questions in Congress last week was whether forty million farmers can stop a clock, whether it be of the tick-tock or the ticky-tacky variety. As with other things at Washington, it is simply a question of votes—the very same thing which will start or stop the league of nations, is doing the same business for the clock, and the question really is whether the farmers of the United States have votes enough to shake the shelf or to frighten the politicians into letting the clock alone.

WHAT IS THE MATTER WITH THE CLOCK?

We are not surprised that the reader should ask this question, for the legislative monkeying with the clock at Washington has not excited the same interest in California as it has in the states east of the Rocky Mountains. At this moment we cannot remember that any assembly of farmers in this state has been sufficiently offended by turning the clock ahead in March and pushing it back in October to take action on the subject. "Watching the clock" has not been attributed to California farmers, and they have perhaps not been appreciative enough of the immortality of making the clock tell lies for half the year. Some of our handlers of dairy cattle have told us they found it inconvenient and objectionable to arbitrarily disarrange milking and household arrangements so that neither cows nor cooks are allowed to wake and work by the dawn of daylight, even in summer, and that the new arrangement makes them begin work in the dark all the year instead of half of it—which was bad enough in all conscience. Milking an hour earlier in the morning and afternoon for half of the year occasions two arbitrary changes at both ends of the day, disconcerts the bovine complacency at both ends of the cow and upsets the human composure which ministers to, and is ministered, by such complacency. There has not been, so far as we have observed, such wide dissatisfaction with the clock-meddling in this state as at the east where nearly all farms are either largely or partly involved in cow-handling, and where most of the work is done by the dwellers in the household of the farm-owner—and yet probably more discomfort than has been publicly complained of has been experienced. East of the Rocky Mountains, however, there has been outspoken protest against the new order, great pecuniary losses have been cited, and great mental and bodily rebellion has resulted, especially among housewives robbed of their rest-giving morning naps because the clock lied about

the dawn and added a full hour to their working day. Farmers' wives, it is claimed, have lost the roses from their cheeks—the color having mounted to their temples, where the fountains of anger are reputed to be playing. From their point of view the claim is that changing the clock is done for the purpose of giving the farmers another hour of work in order that the city person can have another hour of play!

Nor is the trouble confined to the arbitrary beginning of the long summer day before the sun sets things right for it. To add a morning hour when things in field and orchard are not right for work is no gain when compared with the loss of an hour of an 8-hour schedule by quitting in the afternoon when all conditions are right for carrying-on. From their point of view the title of the enactment: "the daylight-saving law" has been changed in current comments to the "daylight-wasting law."

THE ALARM GOES OFF!

There must be a real issue involved, for otherwise it would not be possible to arouse farming people to such outcry as they have made in all the eastern states. For it is an interesting fact that much as we have complained during the last few months of discord among those claiming to represent farmers at the national capital, there has been one subject upon which they have earnestly and energetically agreed. For instance, the Temple-Builders at their Washington conference in January last, took this action:

Whereas, the farmers of the United States lost thousands and possibly millions of dollars by the daylight-saving law last summer, especially in the harvest and spraying season; therefore be it

Resolved, that the National Board of Farm Organizations hereby petitions the Congress of the United States to repeal the existing law that sets the clock ahead one hour the last of March each year.

And representative of the Temple-Deplorers also favor it, for we have read this:

The secretary of the Farmers' National Council suggested that in view of the changed conditions from last year and the large crops the repeal of the daylight-saving law was in order this year. The manufacturers who are responsible for the enactment of the law are practically asking the farmers to pay their help for one hour's less work each day than is customary—just at the time of the year when farmers suffer most from a short day.

And the National Grange, which apparently is keeping on good terms with both the associations just mentioned, has been making also its own campaign against national clock-mending and announced with much satisfaction under date of May 3:

The effort which The Grange made to secure the repeal of the so-called Daylight-Saving Law, in the closing days of the 65th Congress, is bearing great fruit. Dozens of agricultural papers have taken up the fight, and Senator Arthur Capper of Kansas already has hundreds of thousands of signatures to petitions, and states that he will introduce a repeal bill as his first official act.

And again in its public announcement of July 1, the National Grange sang this paean of victory:

Congress listened to the farmers long enough to do as they asked, and kill the so-called Daylight-Saving Law. This was by a vote of 56 to 6 in the Senate, and 232 to 122 in the House.

It was of course no surprise that when the farmers set off the alarm by sending in hundreds of thousands of voters' names demanding the return to setting clocks by the sun, the congress should do as they were asked by an overwhelming majority. Nor was it surprising that the announcement was made that saving daylight by losing it would disappear henceforward from the Acts of Congress. It was in fact everywhere supposed that the legislative clock which was set up in Washington last year to misrepresent the time of day was stopped because the farmers demanded it.

THE PRESIDENT RE-WINDS THE CLOCK.

But there are wheels within wheels in political clock-work in Washington as in all other political centers. Instead of approving the agricultural appropriation bill, which with the true-time-rider passed congress triumphantly, as cited above, President Wilson vetoed the bill and thus killed the rider. Here we are again, then, with the clock still booked for its summer cir-

cuit which has no truth to the sun's pathway. President Wilson in his veto message said this:

The act to save daylight was intended to place the chief business activities of the country as nearly as might be within the limits of daylight throughout the year. It resulted in very great economies of fuel and in substantial economies of energy, because of the very different effect of work done in daylight and work done by artificial light. It, moreover, served the daily convenience of the many communities of the country in a way which gave all but universal satisfaction, and the overwhelming testimonies of its value which have come to me convince me that I should not be justified in acquiescing in its repeal."

And that, we take it is the epitaph of Solomon Grundy. Some offense is being taken by congressmen who voted largely as the official representatives of the farmers demanded that they should, and they claim that they would two-thirds the measure over the president's veto, but they failed to do so, though they did advertise the claim that they have done their duty to the farming industry. It is more than probable that they have believed all along that the easiest way to kill the farmers' movement for true time was to let George do it, and George has done it because it is politically safer for him to do it than it might be for any senator or representative from the rural districts of the country. All politics consists of wheels within wheels, and no cogs have been slipped in carrying through this urban amendment of the good old summer time to please laboring, commercial and manufacturing voting classes. The farming interests will have to adapt themselves to it.

THE MISFORTUNE OF IT.

We have stated the matter with some detail because it has aroused much feeling among farmers in other parts of the country and all should know the steps by which a movement, which our constituted agricultural representatives at Washington agreed upon, came to naught. On its face it seems to contradict the claim that if farmers will act together they can secure what they desire in governmental policies. It does not, however, appeal to us as significant at all in that way. It seems to us rather unfortunate that any issue was raised upon it. It is not a question of fundamental and wide-reaching importance to farmers nor to farming; in fact it runs counter to fundamental matters as the President claims in vetoing it. It is unquestionably inconvenient and works some hardship to large numbers of farmers, as their claims for return to solar time allege, but the trouble with it is largely adjustable or avoidable by changing some other things which do not affect people generally. There is no insurmountable objection to having rural time true to the sun and city time conventional. We grew up in a rural neighborhood in which things went by solar time and railway trains ran through by New York time, which was 15 minutes faster, and yet no one lost his head or lost a train because of the double standard. It is, of course, more convenient to have standard time, and if cows have to be milked or produce gathered an hour earlier than the sun to make shipments to centers which require service by false local time, it will work hardship, of course, unless local time tables are changed to suit rural possibilities and economies and the towns are compelled to share inconveniences with the country. On the whole it seems to us that this issue over the clock is not of a character to warrant agricultural organizations in making a test-question of it, and that the eastern organizations did so seems to us unfortunate. When agriculture stands for a thing in the national eye, it should be something of fundamental importance which can be shown to be involved in fairness to other classes who are interested as well as farmers. Financial, commercial, labor and other interests, which have their way in national policy and operation, succeed in getting their way because they can point out to other interests that the same measures affect the welfare of several or of all of them. The farmer can do this more broadly and effectively than any other man because his interests really support them all. The farmer or his representatives will never get anything of much account by simply bewailing his own unhappy lot. All that will be credited up to farm-

ers' growling, which is generally conceded to be constitutional privilege of their kind. There are plenty of things which are fundamentally wrong to farming, and upon the correction of which the highest welfare of large fractions of every community depends. It is, therefore, unfortunate that organized farmers should have made so much fuss about the clock and that they were so badly beaten at it also. They should choose a better objective next time.

QUERIES AND REPLIES

By the Editor.

Inquirer Must Give Full Name and Address.

Probably Alkali Trouble.

To the Editor: I am enclosing specimens of vine and fern leaves from my yard. I have fertilized, watered and sulphured twice, still there is no improvement. The Virginia creeper is turning to autumn colors and does not grow. The grape vine grows, but slowly—also the ferns. It should be glad to know the cause of trouble and remedy. All the vines and other plants are not affected. They are all planted in same kind of soil and the vines are not far apart.—M. T. D., Fresno.

There is no specific disease on the leaves which you send. Their browning on the edges and other discolorations, and your description of the behavior of the plants, indicate clearly that the trouble is in the soil. As you have probably watered and fertilized sufficiently, the probability is that the soil has too much alkali for your garden plants. The fact that some plants show injury and some do not may be explained by the two facts: (1) that some plants can stand more alkali than others; (2) that some places may have more alkali than others—though they may be very near together. Getting out the alkali is difficult and expensive, and perhaps you will have to be content with having the plants which do well in the places where they do well.

Cucumbers Going by Nematodes.

To the Editor: I have a lot of nice cucumber vines which have been well cared for and suddenly they commence having dead leaves on them; later the stems become yellow and the plants die. I send a sample of the dead roots—all the rootlets turning to swellings or hard knots. Is there anything I can do at once to save the rest of the plants?—C. H. W., Hemet.

The roots show a complete infestation by nematodes—commonly called "eel-worms." They are too small to be seen without a magnifier and they are ensconced inside the swellings or knots which you describe. There is no way to reach them by treatments: the plants seriously invaded are gone beyond saving. It is not probable that all your plants will fail this year, but you must give up growing vegetables on that particular piece of land. As soon as you get off what you can, dig or plow up the land deeply, raking out and burning all roots you can—leaving the land rough to be dried and heated by the fall sunshine. After the rains come work the land down and put on grain or clean the soil by a full year's bare fallow. These pests must be sun-burned out and starved out before the soil will be safe for vegetables.

About Plum Varieties.

To the Editor: Do shipping plums such as the Formosa, Santa Rosa, Climax, Wickson and other Burbank varieties bear regularly if planted by themselves, or must I plant hardy sorts among them for pollinizing purposes? Has the Italian prune any advantages as a producer over the French or the Imperial? Do you think the above named varieties would do well in the foothill districts near Healdsburg?—P. H. A., Albion.

The Japanese plums you mention do not need association with European or American strains for pollinization. Some of them may be shy when planted each by itself, but they help each other so that it is not necessary to seek pollinizers out of their class. The Climax is especially noted for helping other Japanese varieties in this way. It is, of course, very fortunate that the Japanese varieties serve each other, for the average blooming date of Europeans and Americans is so much later that their service would be doubtful. The Italian or Fellenberg has nowhere in California any advantage over other prunes in bearing: it has in fact been practically abandoned for many years

for shy bearing. As for the commercial desirability of growing shipping plums in the Healdsburg foothills, only local experience in orchard and market can answer that question. Before planting for that purpose you should make careful inquiry among local wise men.

Starting Walnut Orchard.

To the Editor: I have been making enquiries in several counties regarding the best practice of planting out a walnut orchard. The several nurseries advise planting trees grafted on black walnut root. Yet I find the most successful orchards are this where the black seedlings were planted and the tree grafted when five or six years old. Can you give me any light on this subject?—N. J. C., San Francisco.

We doubt if one-tenth of one percent of the trees now making our walnut crop was grown as you describe. There is therefore no proper opportunity for comparison, which in breath and duration would justify your conclusion that such orchards are most successful—unless you desire to substitute a prognostication for a demonstration. The large areas of transplanted seedlings in Southern California do not apply because they have not been in very large proportion grafted. We do not, however, doubt that good trees can be had by grafting or budding seedlings in place, and we would begin it when they are three years old instead of six. Still we prefer starting with grafted trees because the greater cost of starting that way will be more than covered by the cost of field grafting, re-grafting and caring for the growth on the scions, the cost of cultivating trees so long for bearing, the delay in bearing and the intellectual anguish of having in all probability an orchard of trees lacking uniformity in form and development.

Nitrate for Die-back.

To the Editor: This cure for sour sap in trees has been recommended: Make a slit in the bark where not reached by sun and insert a small quantity of nitrate of soda. I wish to ask if it would not be as effective or better to dig it into the soil around the tree. If so, how much would it be safe to use not to injure the tree? We have cherry trees that are 12 years old with dead limbs full of cherries and apple trees two years old that are dying. Of the 160 cherry trees set 12 years ago and reset, we have 40 partly dead ones left.—W. H., Sebastopol.

Slitting-in nitrate for such root-failure as your description indicates is as irrational as it would be to scratch a match on your nose to cure varicose veins in your legs. Your idea that it would be more rational to dig the nitrate into the soil is correct because if the tree has any strength to repair its roots a nitrate-broth where the now active rootlets can reach it would help them to get stronger. You can dig in from one to five pounds to the tree (according to its size), providing you scatter it well and providing also that you put on plenty of water to dissolve and distribute it. But we have no idea that any such tonic will avail anything where growing conditions in the soil are so bad that tree-failure, such as you describe, occurs. The land on which trees fail that way is either too full of water in the winter or too dry in the summer. You probably know which, but of course we do not. For winter standing-water the cure is under drainage; for summer root-failure through drying out, the cure is irrigation. You must X-ray your land with a spade winter and summer to find out which condition you have—and you may have both.

Ungrateful Strawberries.

To the Editor: I have some ever-bearing strawberries. They are prolific bearers, but very imperfect in shape. They came from somewhere in the East, and were said to be very fine. Can you tell me what would improve them? They were new plants in the spring of 1918. I took off runners and bunches of berries, for they bear in bunches. For some time the plants looked fine and bore well until late last October. This spring I had the plants divided and reset, for they were so large. I still pull off the bunches of blossoms to give the plants a chance. I water them well and have them cultivated between rows once a week. What more can I do?—M. E. M., Los Angeles.

Very little has yet been learned by California experience of the new Eastern ever-bearing varieties of strawberries and the probability is that they will not serve any particular purpose here because the varieties we commonly grow are practically in bearing all through the growing season if well

WHY NOT YOU, TOO?

During the last few months several of our readers have taken up our work of attending to renewals and securing new subscriptions. They have done remarkably well—many making more money than they had ever earned before.

We can use a few more ambitious, energetic men. Experience not necessary, as we give you proper training. But you must have an automobile and should be able to devote your entire time to the work. Straight salary; permanent work. Write for particulars and tell us a little about yourself. You'll be glad you investigated this money-making opportunity.

cared for. We cannot definitely tell what is the matter with yours. It may be that they are seedlings, or from a seedling which has the bad habit of bearing imperfect fruits. Many seedlings have to be abandoned because of that defect. As, however, they were commended to you as good in this respect, it is possible that you are pushing the growth of the plants so hard that they cannot settle down to orderly fruiting. We would let them taste mild hardship. Give them less water and stop cultivation for a while; also stop removing fruit stems and stop dividing plants. Let them make as large bunches as they desire and try for all the fruit they can carry, giving only water enough to prevent evident distress, as shown by the foliage. If they do not then bear well-shaped fruits, throw the plants over the fence.

Roses on the Mountains.

To the Editor: I am at an altitude of 5,000 feet and my roses look most miserable. I have killed all of the aphids with tobacco solution, but now something else is wrong with them. The blooms look rusty and fall off before they are fully developed. My ramblers were affected with mildew, but I used sulphur, and they are getting better now. May be it is too high here for roses. I have been a gardener for 30 years, both in this country and in Denmark, and this is the first time that I have had trouble with roses under my care.—J. J., Big Creek.

You are up against natural conditions which, in their relations to rose growing, are little understood. As an experienced rose-grower you have doubtless done everything in the way of culture which any one could do. The trouble probably lies in the ill-adaptation of the varieties you are growing to the natural conditions which determine their behavior. Probably these conditions are incident to your elevation. The roses which are so splendid in California valleys and for a certain elevation in the foothills, do not act as well in the mountains nor on the adjacent high plateaux. It is possible that what are called "hardy classes" of roses in the Eastern States may be the ones upon which we must rely in our mountain districts, and the teas and hybrid teas, which do so well in our valleys and foothills, may have to be kept under glass, as in other wintry parts of the country. But even this surmise has not been demonstrated by fully convincing trial.

If you have a collection including different classes of roses, do you not observe that some do better than others? If there are other persons near you who have been trying to grow roses for some time, cannot you visit them and see if they have varieties which bloom well and get cuttings of them, and at the same time see if they are not of a class of which you can secure better varieties than you succeed in finding in the hands of local growers. It would be of advantage to all who are trying to grow roses at high elevations to have this matter intelligently looked into and the results published. Your training and experience qualify you to do a public service in this way. Meantime what can other readers of the Rural Press who have undertaken to grow roses at 5,000 feet elevation tell us of their experience?

California Weather Record.

The following rainfall and temperature record is furnished the Pacific Rural Press by the United States Department of Agriculture Weather Bureau at San Francisco for the week ending July 15, 1919.

Stations—	Rainfall		Temperature	
	Past Week	Seasonal To Date	Normal To Date	Highest Lowest

Losses from Thrips-Scarred Peaches

(Written for Pacific Rural Press by Jno. J. Fox.)

In the fall of 1915 C. V. Freed, near Newcastle found that the number of peaches showing scars and skin-abrasions was increasing. In the early part of the year many were scarred so badly that they either dropped off or were ruined for packing. He estimates that he has lost \$10,000 worth of fruit in the last few years from

Typical abrasions and scarring of peaches by thrips larvae. The lower right and the center left hand ones will never develop while the others will be spoiled and could never be included in a pack.

this cause. R. B. Sherman of Long Valley has had the same experience, according to Farm Advisor E. O. Amundsen of Placer county, who recently showed us some of these thrips-scarred peaches.

Where They Come From.

On investigation he found this con-

dition generally prevailed along a ditch or fence or wherever weeds were allowed to grow rank and mature. He found the little insect burrowing among the fuzz on the peaches. These he sent to the University to determine their family and they were pronounced to be the larvae of pear thrips. They seemed to breed on miner's lettuce and other weeds. Mr. Amundsen says they have found that these thrips larvae can be controlled by one spraying with the nicotine spray as used on prunes, but that it is better to spray twice for a clean job. That thrips are now suspected as being responsible for scarring on plums and apples is true in several regions. We have mentioned one man having sprayed his apples this year because of the russetting produced. This is a matter which will receive much more attention and closer inspection than it has in the past.

Other Reasons for Scarring.

We do not mean to imply that all scarring or distorting of peaches are due to thrips damage. But it is easy, especially in its earlier stages, to distinguish this injury from the corrugations and irregularities produced by curled leaf fungus, from the gnawing of a worm or from abrasions caused by whipping twigs. The importance of guarding against such injury is obvious.

In the case of freestone peaches, they can be cut. Clings, unless used for canning, will be spoiled for shipping green and many of them entirely too shrunken to use at all, even if they do not drop off. We mentioned in the spring the amount of bud injury that thrips were doing to peaches and plums, as well as prunes and cherries, and the illustration herewith presented will help to impress the importance of the matter on the minds of those growers whose wood and fruit have been affected.

Fruit-Tree Conditions in July

(Written for Pacific Rural Press.)

The condition of trees in the semi-dry, as well as the irrigated sections of Northern California are very different from that of a year ago. Cherry, apricot and plum trees are green and vigorous; peaches, prunes and walnuts are a good color and carrying their loads well as are almonds, excepting where the mites have been bad.

In some prune orchards where the work of the thrips larvae showed up in the spring, a lot of naked twigs or little leaves are still apparent—some dead. In some instances the mites have completed the deadly work on limbs and twigs weakened by thrips. If one had the time or labor, this would be a good time to cut back all weak or moribund growth to sound, healthy tissue. A lot of vitality would be saved to the tree this way and such wood is not so easy to distinguish when the trees are dormant. Nevertheless all prune trees look a lot stronger than they did this time last year; new growth is showing up even on trees that are carrying very heavy loads of fruit.

Almonds show more instances of what our soldier boys call "Lazy Ally" than any other orchards. We have noticed in different sections serious damage to foliage on almond trees from red spider and mites, some even losing leaves and other leaves already a light grey in color. In mentioning this to George P. Weldon of the State Commission of Horticulture yesterday, he said: "Many men

do not realize the gravity of the injury to trees when the foliage is so damaged at this time of year. It is nothing short of disastrous. I believe that one thorough application of sulphur when the pests first begin to show up will control them. The damage is not only to the current year's crop; the vitality of the tree is so impaired as to affect the setting of the next year's crop. Our perennial shortness of supply of almonds may be largely attributed to this fact."

Almonds are injured by the ravages of mites to a greater degree than any other tree, yet there are a larger number of almond growers who see but do not perceive the injury they sustain. It is only fair to state that quite a number of almond producers only have avenues or fence rows of almonds—it is a sort of side-line or pick-up with them. However, each year more men are taking pains because all the big growers are doing it. The smaller men figure that their bigger brethren are not the kind of men to throw away money for nothing. These tiny mites are not by any means insignificant. Collectively they do almost as much damage as an infestation of army worm. Their presence is a dominating factor in the almond industry to the extent that they may be called the boundary line between success and failure to any man whose sole livelihood is the production of almonds—taking a ten year average on selling value of property.

GIVES SULPHUR A LITTLE AIR.

Albert Glazer of Hillsborough near Dry Creek (Sonoma county) came to see us the other day about an evaporator. He thinks that all late ripening sections will have to instal evaporators for prunes in time and for pears in late sections where rain is early. He says that he gets better results in sulphuring his pears by running a two-inch pipe into his sul-

phur container and then out again. When the sulphur house was hermetically sealed he used more sulphur, got poorer results and there was always a clinker of sulphur left. Now, by admitting a little air to the sulphur-box he uses less material, sulphurs twice, every bit of sulphur is consumed, and a whiter pear results. He leaves the fruit in about two hours. Seems to be worth trying out.

WATER ADDS VALUE TO PRUNE CROP.

How can you compute the value added to a prune crop by judicious irrigation? It is, of course, an estimate, but here is a definite estimate by a successful prune grower who has raised prunes without irrigation and only put in an irrigation plant last year.

"I estimate that I have increased the size of my prunes in the old orchard ten points," by irrigation, said Henry Wheatley of Napa county, "and that this will give me 15% increase in weight. The increase in weight and higher base will, at present prices, give me \$4,000 more gross on an 80-ton crop and net \$3,000. For the cost of irrigation (inclusive) was well under \$1,000."

In addition to the increased value of the crop the added vitality to the trees should be considered and this is no small item. For it is difficult to get a real heavy crop and new growth too; that new growth that is essential to the production of sizable prunes. The longer a tree can be made to hold its foliage in the fall, the stronger it starts out in the spring.

Canners are picking up apricots on the San Francisco market (July 11) \$140 a ton as they were unable to contract for enough to fill their requirements. They are taking other fruits like plums, etc., in the same way.

The table grape crop around Lodi looks fine. No injury is apparent from the hot spell and the future never looked more promising as they are now practically safe from scald. Shipping will commence on Tokays about the second week in August.

GERMAIN SEED & PLANT CO.
LOS ANGELES.

THE
CERTIFICATE
OF QUALITY

Germain's PROVEN Melilotus Indica seed costs more per pound because—

- it is proven, tested seed.
 - it has highest percentage of PURITY and GERMINATION.
 - it is recleaned and scarified (Tight outer hull is removed to assist quick and easy germination). This is an expensive process, but results justify the cost.
 - it develops extra long roots which loosen the soil and release valuable growing elements. The surface growth is thick and lush which provides a good mulch when plowed under.
 - it is practically free from weeds. You obtain almost 100 per cent pure seed.
 - it is the KING of Cover Crops.
- Results obtained with Germain's Melilotus Indica seed more than justify the difference in price—and it's RESULTS you are after. Don't wait until last-minute demand causes prices to rise. Order now and obtain lowest possible quotation.

Overland
TRADE MARK REG.

Showing the World What 600,000 Already Knew

OVERLAND Model 90 is a car of practical utility. It rides with luxurious comfort, and is amply powered for steep hills and rough roads. It gives service that you can depend upon under all conditions.

At the same time, Model 90 has the appearance which is a source of satisfaction to its owner.

The dependability of Model 90 is illustrated forcibly by four recent records, made in widely separated parts of the country and under greatly varying conditions.

In Oklahoma, a Model 90 stock car, motor sealed in *high gear*—broke the world's record, making 4370 miles in 7 days and 7 nights of continuous running.

Again on an informal test trip between Oakland and Los Angeles, a Model 90 covered 947 miles in 28 hours and 45 minutes, averaging 24.28 miles per gallon of gasoline in spite of fighting a heavy storm all the way.

In the "Boston-Springfield Dependability Run," a model 90 stock car made 3852 miles in 7 days and 7 nights at an average speed of 25 miles per hour without motor stop.

Then came the new World's record at Harrisburg—702.5 miles a day for 5¼ days without motor stop, sealed *high gear*. Here again a Model 90 stock car demonstrated its staying power.

Such convincing tests are only conspicuous examples of what thousands of Overland owners know their own cars are capable of doing.

Their experience is a safe guide for you in selecting a car.

Here and There in the Fruit Business

[Written for Pacific Rural Press.]

Doubling the Life of Trays and Rinsing Prunes.

Two dressed lath strips at the back of the prune trays instead of only one in the center will actually double the life of the tray without adding noticeably to its weight, according to R. P. Van Orden of Mountain View (Santa Clara Co.). His trays are well built this way with a light dressed sugar pine lathing strip. Between his prune dipper and grader he has built in a rinsing tank with a draper attachment driven from the grader which conveys the rinsed prunes on to the grader. They are said to cure more rapidly after this process in which Mr. Van Orden has eliminated any extra expense beyond installing this home-made tank and draper.

Record Season in Tulare and Fresno.

"Apricot harvest is about half over with us, says Alfred Gunnarson of Kingsburg (June 28), and the crop is better than 100 per cent. Overloaded trees and shortness of water makes for small sizes and a little lower quality, but the tonnage and the market are there. Our ditch water was closed off about June 10, but I don't think that the water shortage will materially decrease the peach or raisin crop. For most own or are installing pumping plants. No mildew has been reported on the grapes yet, and red spiders and mites have not appeared in any great numbers, so there is no doubt that this locality will have the biggest crop of its varied fruits and the best prices in its history."

The California Co-operative Canneries.

New plant at San Jose is nearing completion. It will cover (with cottages and all) 18 acres of ground. They "got a move on" to take care of the cherries for local growers. Cherries dropped to 6 cents, so the C. C. C. rushed some machinery and pay cherry men 8 cents as first payment and as much more as the market affords after deducting overhead and 8 per cent on stock.

This huge cannery will handle 20,000 tons of fresh fruit and tomatoes this year as a starter. It is a stock company with the stock all trusted paying 8 per cent max. They have plenty of money and plenty of trade. The San Jose plant alone will employ from 500 to 1,000 hands. It will be completed in time to start on apricots the first week in July.

The Coast Will Furnish Flower Bulbs.

The quarantine against the importation into this country of all bulbs except tulips, hyacinths, narcissus and lilies went into effect June 1. This is likely to lead to a rapid development in the growing of bulbs and other ornamentals on the coast. Already in the last five years bulbs have risen to a stage of commercial importance in State production, and it has been proved that they can be grown as successfully in California as in Europe. The \$8,000,000 worth of bulbs heretofore imported each year will henceforth be raised on the coast. As to other ornamentals, we have azaleas and rhododendrons growing wild—they belong here as do many other cultivated varieties. The new Quarantine laws will benefit California in more ways than one.

The Nursery Business in '57.

Ethan Allen Chase, the well-known veteran nurseryman, was asked to address the assembly at the Nurserymen's Convention. In rising to the honor he said that he embarked in the nursery business in California as far back as 1857. As a contrast to present scientific methods demanded from nurserymen, Mr. Chase said that at that time there was no recognition of types of bearing qualities of trees propagated. Varieties only were considered. Nurserymen thought it was all right to select buds from the robust trees and those showing the strongest growth, usually an indication that its fruit-bearing quality was lacking. Baldwin apple

was a Baldwin apple and variations were not recognized. Since that day so much had been learned in the nursery business until today only trained men were entrusted to cut bud-wood by responsible nurserymen. The suggestion offered at that meeting for co-operative bud selection of the best types was the culmination of years of thought and observation on the part of practical men. Its adoption must be of incalculable benefit to the fruit industry.

A Precocious Walnut.

F. B. Cunningham of Exeter (Tulare county) has a 6-year-old walnut tree on black standing in an alfalfa patch that is 25 feet high and over a foot in diameter at the butt. It is grafted on California black and has a fine load of nuts on.

Figs Interplanted with Nurse Crop.

H. A. Vaughn, near Merced, has 160 acres planted to figs, interplanted with peaches and apricots, which will pay dividends on the ground they occupy till the figs need more space. He irrigates early in the year—a good, thorough wetting, and then again in July. A power-pumping plant furnishes the water here. Sixty acres of the figs are Calimyrna and the whole orchard looks in the pink of condition now (May 20).

New Prices for Dried Peaches Good.

The California Peach Growers' Association announced that members of the association will reap a harvest of many thousands of dollars this season in excess of last for their crop. General Manager of the Peach Growers' Association announced the prices for export "yellows" as follows: Standard, 15¢; choice 16, fancy, 17¢. The same grades brought for the 1918 season the following opening prices: Standard 12¢, choice 13, fancy 13½. Fifty per cent of each order will consist of practically peeled fruit at 1½ cents per pound higher than the prices given.

BERRY GROWERS SUFFER FROM SUN.

At Sebastopol the continued steady sunshine during the past month culminated in a couple of real "scorchers" on the 11th and 12th of July. The heat has cooked the Loganberries and Mammoths—burnt them up. Only the blacks are left and they are quite badly burnt. They will need cooler weather from now on to get through, according to D. M. Searby of Occidental.

On one ranch of 55 acres of berries—mostly logans and mammoths—only 15 tons had been picked up to Saturday night. About one and a half tons more were left to pick and that ends that. The 75 pickers left Saturday night. Another man picked one-third of a ton to the acre and then quit—all the rest of his berries were burnt up by the sun. These are only two examples of this district, but it is all alike. There have only been two fogs this season.

The silver lining is that many of these growers have good crops of apples growing among the berries and prices are "right." Jonathans and Newtowns are a little light, but Spitzenbergs, Baldwins and Wagners are fine, and Gravensteins—the main crop—will yield 600 carloads in the Sebastopol district. Apples are winners in this section.

THE PRUNE MARKET IN CANADA.

Canada will consume double the amount of dried prunes and apricots next winter she has ever taken before, and if prices are held within reason will continue to buy in increasing quantities, according to a report from the Canadian representative of the California Prune and Apricot Growers' Association. An almost untouched market lies open to our dried fruit men in Canada with the return to peace, he says. The Canadian govern-

ment has removed the 7½% war tax on dried prunes, the two-thirds of a cent a pound pre-war import duty only remaining. An Association representative has been placed in every Canadian city of more than 20,000 inhabitants in the drive for new prune and apricot markets. This will permit direct selling to Canadian buyers instead of through New York and Chicago brokers, thus saving them the half-cent a pound brokerage. Such drives for new business would be impossible for individual growers or packers. Co-operation on the most extensive scale renders such action feasible.

The farmers around Modesto are planning to run a telephone exchange of their own to connect the eight independent lines owned by them. The Farmers' Union of Stanislaus county is back of the movement.

The estimate on the coming olive crop is 66 per cent of normal compared to 75 per cent one year ago and a ten-year average of 84 per cent, according to E. E. Kaufman of the Bureau of Crop Estimates.

Eighty acres of wine grapes at Lodi have been sold at \$62.50 a ton f. o. b., it is announced.

SECURITY KANT-WOBBLE LADDER

FREE INSPECTION

There are a few fruit districts where the SECURITY Ladder is not handled by a dealer. If your dealer is not among the 65 listed in Pacific Rural Press, May 24, page 798, I will ship you two or more ladders, subject to your examination and approval. Prices, 8 ft. \$5.00; 10 ft. \$6.00; 12 ft. \$7.50, freight prepaid.

Carlot shipment of cantaloupes Imperial Valley to July 1 amounted to 6,768 cars this season. Melons were still moving and prices maintained.

MADERA COUNTY HAS FINE PEACHES AND PLUMS.

Recently, we went into "probably the finest peach orchard in Madera county," as Horticultural Commissioner March banks called it. One hundred and forty acres of deep sandy loam belonging to D. B. Harris, President of the Madera Fruit Growers' Association, is really a model of training and management. The peaches are McKeivitt's, McDevitt's and Tuscan's; Lovells, Fosters and Elbertas. They are about 30 acres of plums and some apricots and the rest are peaches. Six and seven years old, but already in their prime. The trees are headed about a foot high, trained on the approved vase shape with fruit wood clear to the ground. The foliage is dark rich green and the trees carry a fair crop of fruit inside and out. The limbs are wired up. The whole orchard is piped for irrigation from highest points, an ample supply being furnished by the pumping plant. Thinning of peaches was going on (third week in May), and more men would have been welcome to thin apricots, but help is scarce.

They have no curled leaf here because no spraying operation is ever omitted. On the plums we noticed a fair crop of Santa Rosas, poor pollenization showing in heavy drop. The Tragedys were poor but the Climax showed a heavy crop, even allowing for a considerable drop.

DRY OR WET SPIDERS?

To the Editor: Kindly allow me space to correct a misunderstanding on the part of Mr. J. L. Sweet, of Arbuckle, as expressed in his article in your issue of June 21st.

It is quite true that sulphur—either wet or dry—will continue to fume for some weeks after application; but, there are fumes and fumes; and, as I attempted to state in my article in your issue of May 31st, the toxic value of the fume is lost after about six days' exposure to the atmosphere. True, the fume remains, but it does not kill the spider. I have seen spiders traveling about, plowing their way through the sulphur, entirely unharmed. I have seen them traveling about on leaves holding the deposit of lime-sulphur, unharmed. Mr. Sweet says "four weeks after application the fumes are strong enough to give his neighbor the asthma." Unfortunately, spiders do not seem to be afflicted with asthma, and cavort around through the fumes quite happily. My four-application dry sulphur system is proving successful for a number of people, killing the spider, preventing the fall attack, and leaving a clean grove for the coming spring, besides cutting the cost.

As to cost, Mr. Sweet says that it requires two men and a boy to spray his 50 acres in five days. Evidently he forgot to mention a team of horses and a gasoline engine as well as a \$300 outfit. I will take my \$18 outfit and give his 50 acres the most thorough treatment they ever had, and do it in three days. If the trees are very large, or spreading, it may take a half day more, but ordinarily three days will do the job.—John S. Davis, Los Angeles.

The acreage of California cotton planted and standing as of July 1, is approximately 169,000, having a condition of 99 per cent normal and indicating a probable production of 114,000 bales, says E. E. Kaufman, field agent in the United States Bureau of Crop Estimates. This is compared with last year's acreage of 192,000, with a production of 97,700 bales. In the San Joaquin valley this year 8,000 acres are planted to cotton, as against 2500 last year.

Short rain and scarcity of fog has reduced the lima bean crop to about one-third what it ought to be according to C. A. Storke, who has a large acreage in Santa Barbara county.

It is reported that wheat from southern Tulare county sold in small lots has brought 40 cents per cental above the Government price.

Even the BEST tire will not give the service it should give if used on BAD roads. Why not put these wasted tire dollars into PERMANENT GOOD ROADS?

Mohawk Mileage Built in by Hand

There's a big difference between any hand-made article and any machine-made product. And there's just that difference between Mohawk tires and other tires.

Mohawks are *hand-made* by the highest priced tire builders in the industry.

The *good* tire today comes from the best material and best workmanship—not from secret methods or special processes.

Actual Value Makes the Tire

The ability to put only *pure* material in a tire—omitting all the "fillers" such as barytes, clay, glue, whiting, lead oxide, reclaimed rubber, rosin. The ability to use an extra ply of *standard weight fabric*—to use *hand* methods only and to pay for the higher priced workmen necessary in *hand* building. These are the things that mean more *actual* value in a tire.

And it is *actual* value that gives better *actual* mileage.

Mohawks are made, either Cord or Fabric, in ribbed and non-skid treads and there's a special Ford size, hand made with an extra ply, too.

QUESTIONS ANSWERED.

To the Editor: What will keep cut worms from eating young grapes? Will oil drawn from a crank case of auto do for mowing machine, if filtered?—Porterville Subscriber.

The University formula to poison cut worms is 25 pounds of brain, one pound of white arsenic, and two quarts of cheap molasses. Mix the arsenic and bran dry, and add the molasses,

which has been diluted with water. Add enough water and mix thoroughly to a dry mash that you can sprinkle under the vine easily. If only a few vines are affected you can tie some cotton batting round the vines or apply tree tanglefoot.

Our "Power" editor says that if you are quite sure the oil is properly filtered it will be all right, but the chances are that it would be safer not to use it on internal bearings

ARCADIAN

Sulphate of Ammonia

Men who applied ARCADIAN Sulphate of Ammonia to their grain are beginning to reap the profits.

ARCADIAN Sulphate of Ammonia is the well-known standard article that has done you good service in your mixed fertilizers for years past. Especially kiln-dried and ground to make it fine and dry. Ammonia 25%. Made in U. S. A. Arcadian is the great American Ammoniate.

A New Era in the Fruit Business

(Written for Pacific Rural Press.)

From time immemorial contracts have been held as absolutely binding, and are still so held.

Sacredness of Contracts.

Contractors engage to build concrete highways for the State. If conditions change, and labor costs soar, the contractor "goes broke." There was one serious case where the contractor lost everything he had in the world—landslides and unforeseen complications doubled the cost; the contractor died, leaving a wife and family. A bill was introduced in the Legislature in 1919 for an appropriation that would cover the loss caused by the landslides. It would have helped the family make a new start. The State of California declined to appropriate a single dollar. "A contract was a contract, and the contractor took his chances of bankruptcy"—"The State could not afford to set a precedent."

But different men do things in different ways, according to their breadth of vision and sense of innate fairness.

A Case of Stress.

In 1916 and 1917 some two-score farmers contracted their pear crops for a term of years to a number of canneries, at a price satisfactory at that time, \$30 to \$35. The war came on and costs doubled—the growers were in distress. A conference was held. The canners said, "All right, the country is at war. It's up to all of us to do what we can to be of mutual helpfulness." "We'll raise you ten dollars a ton." So, in 1918, the grower was saved from bankruptcy.

Now the war is over, and costs of labor are still higher.

IRRIGATION DISTRICT IN CONTRA COSTA COUNTY.

A meeting of landowners, numbering about 100, was held at Concord last Saturday to discuss the feasibility of a plan to irrigate about 25,000 acres in Contra Costa county. The discussion brought out the following facts: land to be irrigated lies around Antioch, Pittsburg, Concord, Walnut Creek and in the Ignacio valley; the water was to be secured from the Sacramento river above Antioch, and a system of canals, reservoirs, pumping plants, etc., sufficient to cover the land with 1½-acre feet of water would cost about \$80 per acre, and the annual cost would be \$11 per acre. A vote taken showed that the majority did not favor the project at this time, though we understand about 10,000 acres around Antioch will at once proceed to form an irrigation district.

PRICES ON THE 1919 RAISIN CROP.

Some raisin growers in the North have heard of high prices paid by competing packers. We have reports of growers receiving 10 cents from independents while the growers' organization has refused to intimate yet what prices will be paid for the 1919 crop. It looks like a flank movement on the part of the "interests" to undermine the association by doing a little ferreting. We have even heard of men enquiring if they could get released from their contract for the season by paying an indemnity of \$40 a ton so as to sell at the price named.

It is certain that the Association will pay growers at least as high as any of the competing companies average. We sent in one rather rambling statement to the California Associated Raisin Co. for elucidation and received the following reply:

"In response to your letter of July 1st, I am giving you the following information as to prices paid growers for Northern Bleached Thompsons by this Company:

	1916 Crop	1917 Crop
Extra Fancy	\$152.65 ton	\$194.67 ton
Fancy	144.01 "	184.14 "
Choice	133.68 "	173.83 "
Soda Dipped	104.27 "	162.01 "

Final settlement will not be made for 1918 crop until next November. We have paid 7½ cents on each grade so far. There will be a further payment, but I cannot say at this time how much it will be.

The growers, through Frank T. Swett of the Cal. Pear Growers' Association asked for a conference. A meeting was held at which six canneries were represented and thirty growers.

Canners Come to the Relief.

The increasing costs were discussed. "All right," said the canners; "we'll go even further than last year. We will advance the price \$20 a ton!"

So the \$30 pear will bring \$50, the \$35 pear \$55, and the \$40 pear an advance of \$17.50 or \$57.50.

It took some nerve and breadth of mind to appropriate \$120,000 as a relief fund, but the canners did it cheerfully and generously.

The growers went home with the feeling that it's a pretty good world to live in, and that all business men are not sordid and grasping, and with deep appreciation of the fact that one of California's greatest industries, the canning of food, is in the hands of men of broad human sympathies, and generous outlook for the good of the industry as a whole.

HAUSER'S ORGANIC FERTILIZERS

HAUSER PACKING CO.
Los Angeles, California

QUICK AND ECONOMICAL TRANSPORTATION

QUICKER hauling of bigger loads is the money-saving problem of the progressive farmer. The Nash Quad, which drives and brakes on all four wheels, is solving this problem for farmers throughout the country. Its ability to travel over bad roads, ploughed ground and stubble fields, loaded to capacity, makes it the logical hauling unit for farmers.

The fact that it drives and brakes on all four wheels enables it to pull these heavy loads over rough ground and stubble fields where ordinary trucks would meet with difficulty.

HORTICULTURAL JOTTINGS

The pruning of apricot trees is in progress in the Vaca Valley (July 10). The foliage is in fine condition.

Shipping of pears began at Acampo July 7. Shipping of pears is now on. Winters is also shipping out figs and peaches.

A few wormy apples are being held up in packed shipments, but only a very few. Those unfit for packing are shipped to the cider and vinegar works marked "juice" apples in loose lugs.

Congress has increased the appropriation to aid the nut industry by \$30,000, and the bill carries also \$20,000 to study the utilization of wine grapes in California following "prohibition."

Wine grapes are being bought in Joaquin county at from \$50 to \$250 per acre on the vine, according to variety and yield, it is stated. A. L. Smith at Lodi sold the grapes from 30 acres for \$8,000.

The Wyandotte (Butte county) Farm Center wants the Department of Agriculture to send an expert to that section in an endeavor to control or eradicate "citrus blast," a generic name for a condition that is self-explanatory.

Placerville (El Dorado county) is reported short of fruit packers. The Board of Education may be asked to allow the schools to remain closed a month longer than usual—up to Sept. 1, to help solve the problem of pickers and packers.

Mrs. R. Day, manager of the Overman's Nursery Company of Spokane, was unanimously elected President of the Pacific Coast Association of Nurserymen at the recent (seventeenth) annual convention. "Overman" is an appropriate name.

The earlier apricot districts are about through with harvesting now and the Santa Clara and Santa Cruz sections are now hard at it. The fruit is of splendid quality and the yield will exceed early estimates. Prices stiffen, though most of the fruit is sold.

"I believe we shall have two tons of almonds from one acre of trees this year," said Professor Warren P. Tufts at the University Farm, last week. We went with him to view the trees and think so too. The I. X. L. and Nonpareils are loaded and all varieties are well furnished.

Peach cutting and drying has already started on Crawfords in the earlier sections. Probably more of this variety will be cut than usual as growers know what they are going to get for them and the high price dried appeals to many more than taking a chance.

A systematic campaign against weeds is being carried out by A. L. Rutherford, Horticultural Commissioner of Stanislaus county. Burning of grass and weed patches in cultivated sections is gaining in favor. More of it was done than usual this year on account of grasshoppers.

Various farmers are concerned over the large amount of labor that will be required on the new highways projects. As labor is scarce now they are wondering already about next year. From present appearances more tractors will be sold this year than ever before and more owners driving them.

A number of young fruit trees in the Wyandotte-Palermo district have been injured by field mice, which gnaw the bark off around the surface of the ground. Earle Mills, the County Horticultural Commissioner, is warning growers to guard their trees against such injury by poisoning and other methods.

The Chino Walnut Growers' Association is a new local organization just formed, to affiliate with the California Walnut Growers' Association. They have now developed a sufficient acreage of bearing trees to warrant the establishment of this unit. The Walnut Fruit Growers' Association of Walnut has offered to handle the nuts at cost this year, pending the erection of a local modern walnut house.

More prunes will be produced in the Santa Clara valley this year than ever before in its history, according to E. N. Richmond, who assisted in Government purchases here last year, and who is a leading authority on prunes. One particular reason he attributes is that a very extensive new acreage is bearing its first crop this year that should have borne last year and the year before but didn't. He puts the Santa Clara Valley yield at not less than 35,000,000 pounds, which may be very materially increased if favorable development conditions hold.

Ashley and Brown of Lodi have bought 5,000 tons of wine grapes at \$25 without any proviso—no strings to the contract, it is understood.

GOLDEN GATE WEED CUTTER
Kills the Weeds and Cultivates the Soil
Greatest weed killer on the market. Cuts them off clean, under the surface, close down to the roots. Besides, it breaks up the ground so thoroughly that one user says he saved \$200 in a single season because after cutting the weeds he did not have to plow. Cuts seven feet or less. Weighs but 230 pounds. Cut adjustable to any depth. Constructed of steel throughout. No other implement like it.
WRITE FOR CIRCULARS which illustrate and describes the Sigurd Weed Cutter and contains letters from many users.

Why We Have the Best Rice Conditions in the World

(Written for Pacific Rural Press by E. E. Hodges.)

"I feel safe in predicting that there will be no country in the world so desirable or so successful for rice-growing as California, when we get into the system of rotating rice with other crops," says S. Christensen, who was a leader in the bunch of men

alkali areas. The rice water either distributes the alkali all through the soil, reducing its proportion to a harmless percentage at any particular place, or dissolves the alkali and drains it off as the irrigation water flows to fields below and finally into the rivers.

manent place for this crop in California agriculture. No individual and no county can solve the problem successfully. Mr. Christensen points out that Sacramento Valley rice growers now would be drowned like rats in a trap if we should get a winter like some of those we have had. Private

Sutter Basin people last winter after two dry winters and a small storm in the third.

A comprehensive survey of the maximum floods of the Sacramento and San Joaquin rivers and their tributaries, together with an effective scheme of reclamation in the lowlands and reservoir flood control in the mountains must be completed before much of the rice land will be safe.

Solution Making Slow Progress.

Our readers are aware that such a scheme has been in progress many years. In reporting a recommendation that Congress approve a bill appropriating \$5,800,000 as the Government's share in a \$33,000,000 project to control Sacramento and Feather river floods, the Rivers and Harbors Committee in 1914 pointed out that "the plans and the report indicate that the project has received the most thorough consideration that engineering skill could bring to bear, and that nothing has been left indefinite that it was possible to make certain." The State Reclamation Board had already at that date been in operation some years and has had charge of the State's part of superintending and carrying out the plan. Not all has run smoothly with the Board and great dissatisfaction has been generated, so that the chief business for which it has existed has lagged while property damage by floods has continued. A great deal of work has been done on the Sacramento river, however, and it remains for valley inhabitants to insist on completion of the project there and in the San Joaquin on an honest, impartial, efficient, and speedy basis. Then it will be up to the counties and individual growers to provide drains to the Sacramento and San Joaquin rivers which will enable them to dry off their fields most speedily for harvest and for rotation of crops.

Early Baart Wheat following Rice and yielding an estimated twelve sacks per acre.

who grew what is claimed to be the first commercial 12 acres of rice in the State and who is now raising 2000 acres in Glenn county in partnership with C. Burmester.

Dry-Kill Water Weeds.

To wet-kill ordinary weeds by a year or two of submersion with a rice crop and then to dry-kill the water weeds with grain or other crops is California's fundamental and distinctive advantage. Rain comes most any time in most rice countries. Mr. Christensen does not worry about his water-grass, and he thinks he can't afford to pay for the common practice of hand-pulling, because he has a cheaper way. Much of his rice is irrigated from pumps anyway, but he has a 400-acre field where gyp corn and cowpeas are growing now because water grass seed came from his neighbors by the millions and so befouled this field in two years that it would have made rice unprofitable.

Other Advantages of Rotation.

Anyway, the land needs aeration after growing rice awhile; though Mr. Christensen mentions one field which produced well in its fifth successive year in rice. On the other hand, rice improves worn-out grain soil, not only by softening and penetrating the plow pan, but by leaving a great amount of humus there, and by washing out the alkali or distributing it to harmless percentages.

Since grain following rice must be sown in late winter or spring, according to how soon the field can be drained dry enough to work, the rice irrigation facilities are available for the grain, which is often likely to need some water. We do not know of second-crops following the grain, but there is no lack of water for such in most places where rice has been grown.

A soil type which is quickly workable after draining is of course quite desirable but not indispensable for a grain rotation. Such soils are abundant in the Sacramento and San Joaquin valleys. Where it does not become workable soon enough for wheat, barley, or oats, there are numerous summer crops that can take their place in the rotation.

Rice Growing Reduces Alkali.

The effect of rice irrigation on alkali spots is noticeable on the grain crops following. Such a crop generally has a uniformly good stand, while a grain field where no rice has been grown is generally spotted, due to

Inexperienced Men Best Rice Growers.

The main feature of the rice-growing business, according to Mr. Christensen, is to understand that California conditions are different from other rice-growing countries, and the methods of handling the crop from seedbed preparation to harvest must be different. A number of wealthy Chinese rice growers have gone broke trying to apply Chinese methods in California. Louisiana rice growers have also broken fortunes trying to apply their methods here. We had already been told by H. O. Jacobsen of Butte county, whose four years in the Philippines and several years with the Dodge Rice and Land Co. in Butte county enable him to speak with authority, that men from Kansas, Nebraska, and other non-rice-growing States make much greater success in California than Louisianians or Oriental rice growers. The Hindu, says Mr. Jacobsen, is the poorest rice growers we have, and the Japanese are too eager to get water off early in the fall to produce a plump grade of rice.

Mr. Christensen himself was a bookkeeper before he started rice growing. His associates in the first 12-acre project comprised two sailors, four carpenters, a real estate man, and a blacksmith. All of them are still growing rice and prospering. It is chiefly a matter of willingness to adapt cultural methods to California conditions.

The Big Problem Needs Solution.

But while rice weeds are not worrying these big rice growers, there is a problem of State-wide importance which can be solved only by the State. Unless rice lands can be readily drained without drowning lands below them, there can be no great per-

reclamations have so obstructed the flow of the river floods that there would be colossal devastation of a worse nature than that which overtook

MOLINE RICE BINDER

Conditions under which rice is cut demand a binder that has strength throughout, one whose working qualities are positive and dependable, one that insures a maximum of traction at all times and one that provides protection against the inroads of dampness and mud. Rice growers can make no bigger mistake than to go into the field at cutting time with an inferior machine that causes costly delays at harvest. The Moline Rice Binder will measure up to the most exacting requirements. It is quality built throughout and overcomes the hindrance of actual field conditions.

For this convenience the driver will find that every adjustment necessary for the best work can be accomplished with the least time and exertion on his part.

The utility of the Moline Rice Binder is a big feature. Its outstanding mechanical superiority will be found in shafts and bearings, gear driven reel, open end elevator, clearance roller, elevator aprons, top drive, apron tighteners, aprons, anti-winding washers, butt adjuster, and tried and true binding attachments. Simplicity and positive action is the feature of each working part.

The Moline Rice Binder will grip the ground under the wettest conditions and because of its ample protection to affected parts it will withstand the rotting and corroding action of water and mud to give years of satisfactory service.

A Moline-Universal Tractor hitch can be furnished so that one man has complete control.

Ask your Moline dealer to tell you all about it or write us for full information.

AGRICULTURAL ITEMS.

Beans Helped Sweet Corn.

Alameda sweet corn was fed by Kentucky Wonder beans which in turn used the corn for bean poles and both thrived better than either would alone on an acre in Oakland grown by Wesley Adams. Mr. Adams had a friend who was selling bacteria for inoculation of beans. He followed his friends suggestion by planting the corn and inoculated beans together in the same hill. The beans twined around the corn but never constricted its leaves, and their crop was matured about two weeks before the corn was ready for market. These ears were sold locally at about 50 cents per dozen, and to the produce dealers around 25 cents per dozen. The corn grew much higher than usual, yielded much heavier than common, and had a vigorous dark green color, in marked contrast to a patch adjoining in which beans had not been planted.

Rice Stubble Valuable Pasture.

Turkey men, in the fall of 1917, paid \$2,750 for the use of 1560 acres of rice stubble, in which J. V. Biard of Glenn county was interested. They fattened about 3,000 turkeys and some hogs on it. The turkeys roosted too much in the trees at headquarters; so last fall the stubble was sold for \$2,500 to a stockman. The latter put 800 cattle and 600 hogs on it. The cattle ate much of the straw and the hogs fattened on shattered rice. After this stock was off about 1500 sheep were put on to eat the green stuff. They were there late in January when Mr. Biard said that if warm weather should come, it would make grass grow enough to support 5000 sheep.

Organization and Wild-fire.

Under the State and County Councils of Defense, fire-fighting corps, signalling stations and convenient apparatus all over the State served to save us through a most perilous year from many a disastrous fire. For forest fires were fewer in 1918 than for several years previous, although many of them were doubtless of incendiary origin. Now that these county fire corps have been organized and their value demonstrated, their efficiency should not be allowed to lapse, but rather increased. Uncle Sam will see that the Forestry Department is allowed enough to keep their end up and the officials will see that it is done thoroughly. It is up to the various counties to do their bit.

Swift Farmstead Building.

Geo. E. Pearl has shown what can be done with a Durham stead. In six months he has fourteen acres of alfalfa ready for the second cutting; seven acres of red kidney beans, and the balance of his forty-acre tract ready to be planted to corn. In odd moments he has put up a good set of buildings.

Agricultural Notes

Cotton pickers are expected to be scarce in Imperial and Palo Verde Valleys.

The Stovall-Wilcoxson Co. of Colusa county sold 30,000 sacks of barley at \$3.10 July 9.

Grasshoppers practically ruined a 250-acre rice crop for D. A. Middlecamp of Colusa county.

Wheat fires destroyed a 300-acre crop for Feeney Bros. and 100 acres for Frank Covington of Glenn county.

The price of honey in France rose from 12 and 16 cents per pound to 64 and 70 cents during the 1918 sugar shortage.

A Japanese firm has leased 6,000 acres in Sutter county for rice at \$32 per acre for three years, and they want more acreage.

A sailing vessel recently brought 2,853 tons of Australian wheat to San Francisco. It took 118 days to make the voyage, due to calm seas.

Twelve to fourteen sacks of wheat per acre on one of the Contra Costa

county farms of C. A. Hooper & Co. is reported by William Silviera.

A new company is being formed to irrigate 40,000 acres of the old Solano Irrigated Farms project, which included 90,000 acres. About 6,000 acres here are planted to rice.

A bigger crop of asparagus and higher prices per pound than last year are reported from the Delta section. Growers received four or five cents at the canneries and paid 1½ cents for cutting it.

Forty-eight hundred sacks of barley from 158 acres is the crop harvested by Henry Garrison of Stanislaus county. It was of the Improved Beldi variety and it commanded three cents in Modesto.

The California State Rice Milling Co. plans to double the storage capacity of their Sacramento mills and increase their milling capacity to 6,000 bags of cleaned rice per day.

Sugar cane acreage in U. S. decreased from 527,000 acres last year to 509,000 acres this year, according

to the U. S. Bureau of Crop Estimates.

Rice growers have to pay two years' storage charges on one season's crop under the present system of dating the storage season from June 1 to May 31, according to a complaint of the Pacific Rice Growers' Association before the State Railroad Commission against 85 warehouse

firms. September 1 to August 31 are preferable dates, which give more time to sell the crop through spring and summer.

The British Food Controller has extended a general license for importation of fresh fruits except grapes and pears which are classed as luxuries. This will be welcome to our apple

BELTS

That Wear

Test Special

For Farm or Factory

With the average man, the purchase of a Belt for his machinery is merely "hit or miss" guess work. But not so with the factory owner. Experience has taught him that it does not pay to even consider the placing of a Belt upon his machinery that will not stand the strain. He has learned that the loss in production, while his machinery is idle, is due to inefficient Belting and is greater than the cost of several Belts. Therefore, he buys with his eyes open. He examines and tests his belt and does not purchase until he knows he is right.

TEST YOUR BELTS BEFORE BUYING

Before investing good money in Belting, test it. Be sure you know what you are getting. Examine the cotton duck, see that it is heavy, yet pliable, then note the quality of Rubber Friction used to cement the plies together. If the plies separate easily, it is a poor belt and a mighty poor investment—in fact, the most expensive belt you can buy.

TEST SPECIAL is the one Belt that will stand every test. It is made of high grade

material, specially woven and securely vulcanized with elastic Rubber Friction.

All Plies of a Test Special pull as one. It is a solid Belt. The plies are so vulcanized as to make the Belt practically one strong ply. No chance for them to separate as is the common fault.

The TEST SPECIAL RUBBER BELT is guaranteed to give longer and better service than any other Rubber Belt made and never to separate between plies.

Mail the coupon today for our samples and guarantee on Belting we will guarantee for your special work. "Seeing is believing." Mail the coupon.

Fertilizers and Fertilization--V

(Written for Pacific Rural Press by Dr. C. B. Lipman, Professor of Soil Chemistry and Bacteriology, University of California.)

The Potash Question.

The following paragraph is from a statement of Robert S. Bradley, of The American Agricultural Chemical Company:

"Since 1914 the United States has been unable to import potash from Germany, and as we have produced but a small fraction of the amount normally used for agricultural purposes, fertilizers have contained little or no potash. This is especially true of the last two years, and yet this country has in sight today the largest crops ever produced in her history, while Germany's crops are, from all accounts, far below their normal yields before the war, though she has doubtless used excessive quantities of potash in an effort to minimize the effects of the dearth of phosphates. Other countries also have grown normal crops since the war without the use of potash."

(1) The fact that we have produced the largest crops in this country's history without the use of potash during the last two years is no proof whatever that the lack of potash has not deleteriously influenced the yields of lands needing potash.

Anyone, upon a moment's thought, will readily appreciate the fact that we have never before had so large an acreage in crops as we have had during the war period, hence it is natural that the total crop should be large without in any way indicating that all crops in this country are absolutely independent of the potash supply for their welfare.

(2) The statement is made by Mr. Bradley that "little or no" potash has been used in our fertilizers. He overlooks the fact that small quantities of potash, where potash is at all needed, are likely to be of just as much use as the larger quantities applied, since very little definite information is at hand from experimental work, which gives us leave to be at all dogmatic regarding what constitutes a proper application of potash fertilizer.

(3) In making his statement, Mr. Bradley evidently overlooks the fact that where potash has been used for many years, a very considerable residue of it will remain in the soil to which it is applied, as has been amply substantiated in the analyses of the soils of the Rothamsted Experimental Station, in England, and in many other places. The fact, therefore, that crops continue to be large on lands hitherto treated with potash but not receiving any during the last three or four years, is not proof whatever that potash on similar soil, which has not been receiving it in the past, is not a limiting element in crop production.

(4) Mr. Bradley's comments on Germany's crops can certainly not be taken seriously. We have very little reliable data on the crop yields of Germany, for reasons that are too obvious to expatiate on here. Moreover, any decrease in the yield of German lands might be accounted for in many ways which have no necessary relation to the potash which they have used in excess, presumably.

For example, they have not had sufficient labor; they have not had sufficient farm machinery; they have not had the most skillful labor; they have been obliged to use much less nitrogen, owing to the fact that nitrogenous compounds have entered so largely into the manufacture of munitions, and, finally, an excess of potash may actually be detrimental, as it is actually known that an excess of any salt may be detrimental to crop production.

It seems clear to me, therefore, that any deductions which are drawn from Germany's crops and intended to be used as arguments against the use of potash by farmers in this country are not only specious but probably dangerous in sections where potash may actually be a limiting factor in crop growth, however we may delimit such areas.

Minerals in the Soil Solution.

From the investigations of Burd,

Stewart, and Hoagland, it would seem that too low a concentration of the soil solution makes it impossible for the plant growing in it to obtain the supply of mineral elements necessary for its growth. This seems to be true despite the presence of enough of these minerals in actual solution in the soil moisture. If this be true, it might follow that the mere increase in concentration of the soil solution by the addition of any easily soluble material would render any of the minerals available to the plant which, without such increase in concentration, would not be so available.

This leads logically to the consideration that minerals in the soil solution which are unavailable to the plant because of the low total concentration of the soil solution could be rendered available by the addition of any electrolyte, and perhaps even of some non-electrolyte, and almost wholly regardless of the nature thereof.

To illustrate: a soil solution may become so dilute, owing to the draft by plant roots, that the minerals in

it, though present in sufficient quantity for the needs of the crop, are unavailable. This is due to the low concentration of the soil solution which affects the operation or inoperation of certain physical and physical-chemical forces necessary to the absorption of nutrients by the plant. Under such circumstances, the usual empirical procedure is followed, by which a number of different kinds of materials is applied to determine

which of the so-called essential elements is deficient in the soil solution.

Let us assume that such empirical procedure, like that followed in the ordinary fertilizer experiments for example, results in showing marked stimulation to the crop where potash salts are applied. The conclusion drawn from such an observation up to now, and one which would in nearly all cases be drawn now, is that the soil solution is deficient in potash.

Tractor and Truck (12-24)

For the Price of One

THE WHEAT TRACTOR
Equipped with Road Wheels.

Write for descriptive printed matter.

THE HESSON SALES CORPORATION

California Distributors

235 South Los Angeles St., Los Angeles

The WHEAT TRACTOR handles three 14-inch plow bottoms under all normal conditions. It will furnish power for any hay baler or silo filler, also plenty of power for a medium sized grain separator, with weigher, wind stacker and self feeder. As it is equipped with a governor like a stationary engine, the WHEAT TRACTOR will furnish steady power for pumping water, running an ensilage cutter or doing any similar farm work.

With the WHEAT TRACTORS interchangeable road wheel attachment it can be converted in less than an hour into a road truck with rubber tired wheels and will do anything that a 3500-pound truck will do with trailers. Some good territory still open for dealers.

The Tractor to Buy

ARE you one of the many farmers who need more power to handle the farm work properly? Do you have to work with less help than you need?

If so, you need an International kerosene tractor. The size that gives you power for your heaviest load will handle all the work. Internationals use only as much fuel as the load requires. They are made to work with farm machines—the kind you are now using—and special hitches are provided for all kinds of field and road work. Their belt pulleys are large enough to prevent slippage, run at correct speed, and are set high enough to keep the belt off the ground. They all use kerosene or other low-grade fuels which means a big saving in operating expense.

The Company to Buy From

You know that we have supplied farmers with high-grade machines for nearly 88 years. You know that our tractors have furnished satisfactory farm power for more than 12 years. We have far too much at stake to market machines of any but the highest standards of quality. We expect to

come back some day and sell you some other machines in the long list you see in this advertisement. In every sale we try to build for the future.

Tractor Service Whenever Needed

In line with this policy, we have developed a service organization which now consists of 89 branch houses and many thousands of loyal local dealers, wide awake and attentive to the needs of their customers. Service is a very essential part of any tractor sale. When you buy an International kerosene tractor you buy with it the assistance of an organization that brings a well stocked branch house or a live, local dealer within telephone call, fully equipped to keep your tractor working steadily.

International Tractor Sizes

International tractors, all using kerosene for fuel, are made in 8-16, 10-20, and 15-30 H. P. sizes. A line to the address below will bring you full information about all our tractors and about any other machines you mention in the list shown in this advertisement.

Deficiency in Volume or in Form? Is It Total or Kind of Mineral?

Viewing the same observation in the light of the foregoing consideration, however, we are compelled to recognize that what seems like the obvious conclusion is not necessarily the correct one; it being entirely possible that the application of the potash salt brought about the improvement in crop growth not through the addition of potassium, but through the increase in the total concentration of the soil solution which it induced.

An objection to this argument may be raised to the effect that the results noted may be obtained by potash applications but not by the application of some other substances—phosphates for example. This might easily be explained, however, on the ground that phosphates are relatively so insoluble and are so firmly fixed by the soil that their application does not appreciably alter the total concentration of the soil solutions, and hence may be without effect under the conditions in which potash salts may be very effective.

On the other hand, we should expect sodium salts, for obvious reasons, though carrying no potassium, to be as effective under the circumstances in question as potassium salts, and the literature contains some evidence to prove that that is indeed so. Similarly, magnesium salts and any other readily soluble substances might be expected to act in place of potash, provided they are not toxic.

With all this in view, it must never be forgotten that the situation is complicated by the phenomenon of the exchange of bases. In accordance with this, the concentration of the soil solution would, of course, be increased by the application to a soil of a sodium or magnesium salt, but simultaneously, more potash would be introduced into the solution, owing to the chemical interaction of the salt applied with the potash minerals in the soil. This makes it difficult to ascribe the changes in a crop brought about through the application of a salt to a soil on which the crop is growing, either to the increased concentration of the soil solution alone, or to the increase in the actual potassium supply in the soil solution.

Demonstration Required.

However, we cannot well question the probability of a far-reaching importance attaching to the determination by experiment of the matters just stated and such determination may affect profoundly our current ideas respecting the potash fertilizer industry. These reflections are reinforced by two other facts, as follows:

First—The potash fertilizers made in this country today contain from small to large quantities of sodium salts, and usually other salts besides.

Second—Practically all soils contain a goodly quantity of potassium minerals, which depend for the availability of the potassium in them, not only upon organic matter and the products of its decomposition, but also upon the chemical reactions which take place in the soil solution and soil system when soluble salts are introduced. In the past, we have not accorded sufficient importance to the latter, by neglecting, under field laboratory conditions, the study of phenomena induced by salts in soils.

UNEVEN GERMINATION TESTS IN MELILOTUS.

We have been notified that, for some inexplicable reason, much of the best appearing Melilotus Indica seed, though fully developed, shows a very low germination this year. In some instances as low as 28 per cent. A great many tests show germination ranging from 30 per cent to 40 per cent and some as high as 60 per cent while other seed, seemingly no better in appearance germinates as high as 90 per cent and sometimes better. It would appear safer to growers of cover crops under these conditions, get assurance that the seed is good or try it out for themselves before planting.

Lodi is booming along with her fruit shipments. Up to July 12, 2,085 cars were shipped East, as compared with 1,497 to the same date last year.

EXTRA-TESTED Your Bond of Tire Quality

QUALITY is the first thing to consider in tires. Buy them on the basis of their yield—in mileage—just as you buy seeds on the basis of their yield—in crops.

Racine Multi-Mile Cord Tires and Racine Country Road Tires are quality-bonded by the Extra Tests to which they are subjected in Racine Rubber Company factories.

Racine Multi-Mile Cord Tires

Racine Multi-Mile Cord Tires are featured by the Racine Absorbing Shock Strip—an extra strip of blended rubber, welding tread and carcass, and so compounded that it completely absorbs the jars and jolts of the road. They are mileage wonders—leaders of the whole cord tire field.

Racine Country Road Tires

Racine Country Road Tires—5000-mile guarantee—are specially designed for country road use. They are rugged, wear-resisting tires—built to stand hard knocks.

Use Racine Extra Tested Tires and save money.

For your own protection be certain every
Racine Tire you buy bears the name

THE AMERICAN

FIELD CROPS BIGGER THAN EVER BEFORE

Field crops in the United States and California promise the production of more food than ever before, as revealed in the report of the U. S. Bureau of Crop Estimates July 10, based on conditions of July 1. J. E. Rickards is the chief reporter for California on cereals. E. E. Kaufman reports on potatoes, beans and cotton.

BUSHELS PRODUCED IN 1918 AND FORECASTED JULY 1 FOR 1919.

Crop	1919 Forecast		1918 Yields	
	United States	California	United States	California
Winter wheat	839,000,000	13,916,000	558,449,000	7,590,000
Spring wheat	322,000,000	358,651,000
Corn (Indian)	2,815,000,000	2,500,000	2,582,814,000	2,975,000
Barley	231,000,000	31,546,548	256,375,000	34,320,000
Oats	1,403,000,000	5,712,000	1,538,359,000	5,600,000
Rye	103,000,000	89,103,000
Rice	42,500,000	8,685,600	40,424,000	7,011,000
White potatoes	391,000,000	12,252,240	400,106,000	12,870,000
Sweet potatoes	102,000,000	968,000	86,334,000	1,020,000
Cotton (bales)	10,986,000	114,000	11,700,000	97,700
Hay (tons)	116,000,000	4,530,480	75,459,000	2,970,000
Beans (Six States)	5,600,000	17,733,000	8,584,000
Total, except hay & cotton	6,248,500,000*	81,180,388	5,928,348,000	79,970,000

*Beans not included.

"Weather during June was favorable for harvesting grain and curing hay," says Mr. Rickards. "In some parts of the State a few days of drying north winds did some damage to all field crops, especially cereals, though the latter, except corn, had been benefited and filled out by cool weather during the early part of June. It is worthy of note that the irrigation supply is exceedingly low in some parts of the San Joaquin valley and there can be no hope for improvement in the condition of crops."

Both Indian corn and wheat in the U. S. will exceed all records unless unfavorable conditions arise between July 1 and the end of harvest. Rice is planted on 140,000 acres this year as against 108,000 last year. Although the general condition is favorable, a considerable acreage was sown so late that it may not mature. Yolo acreage decreased, but Colusa, Glenn, and Butte counties increased. Acreage of potatoes in the Delta was increased, but in the State as a whole it has decreased 2,000 acres from the total of 93,000 last year. The condition of hay has dropped one point since a month ago, and another drop is likely due to shortage of water for alfalfa. Pastures are short, but stubble grazing is relieving them. The area planted to sugar beets this year is about 131,000 acres as compared with 100,000 acres harvested in 1918. Owing to deficient rainfall in March and April, the condition of the crop is only 75 per cent of normal as against a ten-year average condition of 91 per cent.

TO THIS SALE HANGS A TALE.

Many farmers hesitate to go into the purebred game because they carry the idea that it is necessary to have a big bank roll for the purchase of expensive foundation stock, and for expensive buildings, equipment, feed, etc. But here is a true story, which proves that the cheapest can be developed into the best and that brains are more necessary than bank bills.

At the recent Moyer National Holstein sale at Philadelphia, the world's champion butterfat producer, Rolo Mercena DeKol, was sold for \$26,000. She was developed by J. B. Hanmer, a Canadian farm boy only 22 years old, who was severely handicapped by lack of capital and labor, yet he persisted with almost unbelievable tenacity of purpose until he reached his goal—a goal which other men with unlimited capital and everything in their favor have failed to reach.

Get this: Rolo Mercena De Kol was purchased by young Hanmer for only \$320, and he then gave her a record of 51.93 pounds of butter in 7 days. Furthermore, her sire, was purchased for an insignificant sum, was considered a commonplace bull, and was sold to the butcher before any of his daughters had been tested.

Young Hanmer has done well with other low-priced cows. Last fall he purchased the 3-year-old heifer, Alva Spofford, for \$170, and gave her a record of 30.33 pounds of fat, which is the Canadian record for that age. Then he bought her dam, Alva Lassie, with a two-months-old heifer calf, for \$280, and made a record of 25.34 pounds of fat without any preparation.

What young Hanmer has done should serve as an inspiration to every dairy farmer, no matter how badly handicapped he may be. It shows what can be accomplished when good judgment is backed by boundless enthusiasm, energy and persistence.

Let's go out in the barnyard and look over the cows. Perhaps there's a diamond in the rough out there—a future world's champion cow, simply waiting for the chance to prove herself. Let's give the cows every possible chance and see what they will do.

Treat your hogs kindly. It is not only humane in principle but a practical policy. Beating, kicking, and whipping hogs not only is cruel and unnecessary, but the bruises show on the carcass and many otherwise per-

fect cuts must be ruled out of fancy grade on account of them. Blood scars invisible on the freshly selected ham often come out distinctly in the process of smoking and thus make a second grade ham out of what should have been a perfect one.

A dairyman should know—
Which is the most profitable cow in the herd and why;
Which is the poorest cow in the herd and why;

How many boarders there are in the herd;
How much feed each cow will consume during the feeding period;
Which is the best and cheapest feed.

We Manufacture Levelers for Any Power From 6 Horses to a 75 H. P. Tractor

A Schmeiser Leveler

WILL WORK WONDERS ON YOUR FARM

Moving immense amounts of dirt daily, and working on ground too tough for horses and Fresno to tackle, SCHMEISER POWER LAND LEVELERS are now being used with utmost success by a great many ranchers, large and small—also by contractors—saving their owners' time, labor and money.

So extremely simple, a child could operate one, as a simple twist of the wrist raises and lowers the bucket or holds it stationary, as the case may require.

A GREAT ROAD MACHINE

Every road district should own one of these machines for constructing roads. They will cut down the high places and make fills quicker and cheaper than by any other known method.

YOU SHOULD

send for our latest catalog, J-600, which is full of interesting information on Labor Saving Devices and machines for moving the earth.

Cream of the Dairy Council Speeches

(Written for Pacific Rural Press.)

Peter Piper, in picking his peck of pickled peaches, did no better job than did Manger Sam Greene when he picked the speakers for the first annual meeting of the California Dairy Council. Every talk was filled with magnetic messages. To give them all would require a book, but here are a few facts that every dairyman ought to know, and suggestions that will put money into the pocket of every farmer who heeds them:

The dairy situation in California is critical. Because of the high prices of dairy products and the heavy advertising of substitutes, people are using as little dairy products as possible.

In San Francisco only 240,000 pints of milk are being used daily, while the consumption should be 600,000 pints to keep the people in proper health.

Over 1,500,000 pounds of oleomargarine are now being consumed monthly in this State and the consumption is increasing at an alarming rate. In Los Angeles and suburbs over 500,000 pounds are used each month.

For everything said in favor of a substitute, a dozen things can be said in favor of dairy products. Advertising should not be confined to the names and brands of dairy products, but should emphasize their food values.

Wipe out the orange, prune, or almost any other industry and the world will go right on, but not so with the dairy industry. Take away cow's milk and not more than one-half of the babies can be raised.

It requires 60 readings to stencil a message on a man's mind. The advertising of dairy products must be persistent as well as consistent.

A profit-sharing plan of paying milkers is being tried out on some dairy farms with most encouraging results so far.

There are no longer enough foreigners to do the milking in California. Young American boys must take their places, but they will not put up with the treatment given Portuguese and Swiss. It is up to dairymen to better the living and working conditions.

The young American would rather use a milking machine than milk by hand. Consequently, this change from foreign to American milkers will mean the installing of many new outfits.

Dairymen themselves are largely to blame for the high prices being paid milkers. They compete with each other too much; they try to get milkers away from each other by offering more money. Wages and conditions should be standardized.

More heifer calves should be raised. Arrangements should be made to take them from sections of the State where they cannot be raised and place them in sections where they can be raised.

Several banks in this State will not loan money to dairymen for the purchase of dairy cattle unless they have purebred bulls or will buy them with part of the money loaned. A good rule for all to adopt.

All dairymen are urged to get behind the new Department of Agriculture created by the State Legislature. In all probability Dr. J. P. Iverson will have charge of the Division of Animal Husbandry, which will supervise the dairy industry. A better selection could hardly be made.

The new feed inspection law, which goes into effect November 1, will be a boon to dairymen. Those who were

working for this bill found that one feed manufacturer in San Francisco was making a profit of \$1,000 per month from ground nut shells put into the feeds he sold. Poor nut! He'll get his due pretty soon.

Cleanliness will increase profits. Small-top pails are most essential in producing clean milk. In one dairy, when regular pails were used, from 60,000 to 4,000,000 bacteria per cubic centimeter were found in the milk, and under the same conditions but with small-top pails there were only from 800 to 16,000. Throw out the old-fashioned pails.

But don't stop there. Keep the udders clipped; clean the udders and hind parts before each milking; wash the hands; milk the first few streams onto the floor. Cement barns and smooth walls are secondary to the cleanliness of the milker and the cows.

The dairy barn is the factory; the cow is the machine; the crops are the raw material; the milk is the finished product. If you expect to succeed you must have a modern factory, the best of raw material and a most efficient machine. The volume of business and the expenses regulate the profit, so keep a cost system and know where you are at.

Cut the Cost with Silage

RIGHT NOW is the time you need an Ideal Green Feed Silo. Mill feed is high and likely to remain so. The farmer or dairyman who owns a silo is not only saving money on his feed bill, but is getting one-fourth more milk from his cows than the man who has to use dry feed altogether.

Summer or winter you will find this silo a profitable investment. It maintains an unfailing supply of juicy, succulent feed at the lowest possible cost. No other one item of farm equipment will return so much profit on the money invested.

The Ideal Green Feed Silo

will make your farm or dairy one hundred per cent efficient. It eliminates all waste and enables you to produce six to eight times more feed per acre than could be raised without a silo to preserve it.

The choicest California Redwood is used in the construction of the Ideal Green Feed Silo. Tongue and groove staves of

selected tank stock insure a perfectly joined, airtight container. Heavy round hoops of soft steel, set 30 inches apart, bind the staves into a rigid circle. Long cold-rolled upset threads, provided with heavy hexagon nuts and our heavy malleable iron straight-pull lugs, permit easy adjustment and add to the life of the silo.

Refrigerator Doors

The doors on the Ideal are of the refrigerator type, interchangeable, and held in place by strong oak locking bars. No other silo has doors like them. They fit in the frames like the doors of a safe or a refrigerator, only they have no hinges. Three points of contact make them airtight and leakproof. Inside they are flush with the walls of silo, thus doing away with all danger of air pockets.

Many special features of the Ideal, together with high-grade material and skilled workmanship, make it the most perfect silo ever built. Our silo catalog, giving full particulars and prices, is yours for the asking.

Water Brings Wealth

It is just as foolish to try to get along without a water tank as it is to do without a kitchen stove. A Pacific Redwood Tank will provide water for all your needs—for your household as well as your stock. Used for irrigation purposes, it will pay for itself many times over through increased production.

Pacific Redwood Tanks are equipped with patent non-shrinking system, which absolutely prevents leakage. Let us tell you more about them.

We also manufacture Pacific Wood Stave Pipe, in various sizes, for every purpose. Ask for our pipe catalog.

Address

Name

Great Endurance of the Ajax Road King

Confidence with which farmers keep on using the Ajax Road King, we regard as the supreme tribute to Ajax endurance.

The Road King is as good as it looks—and note how its massive tread is braced on both sides by Ajax Shoulders of Strength.

More Tread On The Road

This exclusive Ajax feature is the buttress principle applied to tire construction. Shoulders of Strength buttress the Road King tread—give a wider wearing surface—more tread on the road.

No stronger endorsement of Ajax Tires can be cited than the fact that they are 97% Owner's Choice. This means that Ajax Tires are never forced on users when they buy their cars. Instead, this big percentage is singled out to replace other tires originally on the cars.

Buy Ajax Tires, Ajax Tubes, and Ajax H. Q. Tire Accessories from your nearest Ajax Tire Supply Depot.

Mechanical Power on the Farm

Users of tractors, engines, pumping plants, motor trucks, automobiles, electric motors, and other mechanical farm power are invited to make this department an exchange of their experiences and troubles.

BIG GRAIN WITH LITTLE RAIN.

A time when some of our grain growers are still smarting under the loss of crops, due to late planting or incomplete preparation of the seed bed, may be most opportune to remind them by relation of actual experience that such loss could in many cases have been avoided.

We were driving among the foothills of Yuba county wondering why so many fields were uncultivated, covered with a short thin growth of weeds that reminded one of the last hairs on a florid man's bald pate.

Across the road from an empire of such waste land was the finest wheat field we saw on our trip in the foothills—the same land, the same rainfall, the same sunshine, and for 20 years previous, about the same crop as distressed the uncultivated fields. The crop belonged to E. E. Kuster.

It was May 12. The wheat in many parts of the field was even with the writer's chin—over five feet tall. There was a fine stand and the heads averaged about three inches long. Kernels were in the heavy milk and dough stage so there was pretty good chance for them to finish plump and heavy, although many of the leaves were rusted.

We turned in to ask Mr. Kuster why it was in such good shape in such an apparently thirsty land. Significantly, we passed a big tractor with implements near the house.

That tractor had enabled him to plow in the middle of April, 1918, after the last rain, seven inches deep, and to disk the land before it dried out. While the late plowing may have permitted a great loss of winter rain by surface runoff, it was certainly better to get it done in a few days in April than to leave the field to bake all summer. At that season, however, a few days' delay after plowing would have dried out the clods so that they could not have been made useful as a mulch during the summer. Again the tractor ran over the field, this time pulling thirty-four feet of single disks angled to the limit and weighted so they cut into that soil almost to the spoils. It didn't take a lot of time to do both the plowing and the harrowing, nor a lot of men nor a lot of grain feed to get this big job done pronto. The winter's moisture was pretty well held below that disk mulch all through the summer.

In the middle of last October, before any rain came, Mr. Kuster disked it again, broadcasted about 90 pounds of seed per acre and harrowed it with the tractor and without delay. Without such a large unit of power under control of one man, the job might have looked too big to tackle.

NO HORSES NEEDED FOR LAST ROUND IN ORCHARD PLOWING.

One man on the tractor and one on the plow can cut out between the trees clean with the Knapp power-lift disk plow, to which is hitched a twelve-inch walking plow, as suggested by H. G. Knapp himself. His power-lift plow is so designed that the outside disk runs almost in the center mark of the wheel. In cutting away from trees the distance between plow disk and tree is only a trifle more than the distance the hub extends plus whatever margin of safety is desired to avoid barking the tree. With ordinary care on account of the steady pull of a tractor, the tractor plow takes away dirt within seven inches of the tree. Allowing ten inches of tree width and seven inches on the other side, it leaves a strip 24 inches wide. By hooking the twelve-inch plow on the last round, a man can clean out this entire strip.

WHEAT TRACTOR CROSSING CONTINENT "A-FOOT."

A Wheat tractor, made by the Hession Tiller and Tractor Corporation of Buffalo, New York, is now on its way

from New York to Los Angeles under its own power. The trip started at New York City, May 29th, following a send-off luncheon at the Automobile Club of America, after which a short field demonstration was given. Speakers at the luncheon were L. B. Cravath, General Manager of the Hession Company, and James Oliver, Vice-President of Oliver Chilled Plow Works.

One object of the trip is to emphasize the possibility of using tractors for road transportation. The tractor is equipped with road wheels and solid tires. Regular tractor wheels are carried and will be used for field demonstrations and also for demonstrating the quick changing possibilities. The tractor wheels and the three-bottom plow are carried on a trailer which is pulled by the tractor.

POWER DEVELOPMENTS.

The Willows district is developing considerable water according to reports of pump installers and pump manufacturers. One of the latest series of installations are the four pumping plants on the Culver ranch. Four Layne & Bowler pumps are throwing an average of 2,000 gallons per minute and are furnishing water for more than 1,200 acres of rice. The pumps are the 18-inch type and are lifting from depths of 50 feet. The installation of an 18-inch Layne & Bowler pump has also been completed for John Rosenfeld's Sons and is considered the best running pump in the valley, according to observers. This pump is delivering over 2,000 gallons of water from a 510 foot well on the Eucalyptus Farm, leased by John Rosenfeld's Sons to Christensen & Burmester. The latter are well-known rice growers in the Sacramento Valley and are well pleased with their pumping plant.

Samuel Russell, Jr., of Philadelphia, representing the Crocker-Wheeler Co., manufacturers of electric motors and generators, is in California aiding the local district manager, C. E. Ingalls, in laying plans to handle the demand for motors for irrigation and other purposes.

The Avery Co. of the Pacific Coast has just shipped seven of their 5-10 h.p. tractors to Japan, along with two of the one-man grain-and-rice threshers which are built to be run by the small tractors. The threshers have 22-inch cylinders, 32-inch separators, weigh 2200 pounds, require 8 horsepower to run them, thresh 30 to 50 bushels of wheat per hour, and proportionate amounts of other grains and rice.

"Having used a Cleveland tractor in service overseas, and seeing many others in use with the Engineers' Division in France, I have made up my mind that it is just what I need for use in my orchard in California, as soon as I receive my discharge from the army," writes Chas. E. Carter of Antelope Valley, Los Angeles county.

WITTE Engines

2 to 30 H. P.

Built Better—Cost less to operate and to own—Easy to understand—Few working parts—Strongly built—Every part guaranteed against defect during the life of the engine. SAN FRANCISCO, CAL.

MOTOR CAR ROLLER BEARINGS EXPANSION.

The present rate of increase in automobile and motor truck production, as well as the certain growth of the farm tractor and implement industries have served notice on the Timken Roller Bearing Co. that even their increased facilities at Canton, Ohio, where they are employing over 3,500 people, will not long enable them to keep up with the demand for their tapered roller bearings. They have, therefore bought land in Columbus, Ohio, and ordered machinery for an additional factory to employ 1,000 additional persons and to include at the start one building 600x300 feet and two buildings 60x150 and 80x120. This new factory is being built with a view to periodical enlargement without disarranging the economical handling of their work. The new plant will cost over \$1,500,000.

SECOND-HAND LUBRICATING OIL.

To the Editor: To what use can oil be put after taking it out of a tractor crank case? Could it be used in making soap?—S. E. J., Hollister.

It can be used on exposed gears of any machinery where soft lubrication would be desirable, but we do not know of any other uses. Some people warm it and strain all but the last pint or so through several thicknesses of cheesecloth and use it again in the crankcase; but this is doubtful economy.

FARMERS INCREASE PROFITS BY SHARING THEM.

In the manufacturing world, employers are one by one showing substantial recognition that by giving their workers a voice in the management and a share in the profits, enough more work is done and with a spirit so much better that it really does not handicap the industry, but gives it a boost. One of the biggest events in this line which has recently been accomplished is the election by over 28,000 employees in nineteen plants of the International Harvester Co. to accept the "Harvester Industrial Council Plan." It provides for election by secret ballot of employees' representatives to a "Works Council" for each plant and a "General Council" to consider the complaints and suggestions of individual workmen and to recommend officially to the company management whatever seems desirable in the way of wages, working conditions, improvements, etc. Other large plants have adopted ways of sharing profits directly with their employees and getting the benefit of their suggestions as well as their added interest.

Applies to Farmers Too.

Now, this policy which is becoming quite generally recognized by big business men is applicable to farmers also. It tends to solve the most perplexing labor problem in rural life. A man with a financial interest in the crop and with at least a considerate hearing for his suggestions is not in so much of a hurry to migrate, and he does not loaf on the job. Men with families are attracted to such propositions, and they are generally the steadiest kind of help.

Irrigators Get Share of Crop.

A well-known rice grower, S. M. Joslin, of Placer county, gave us a pointed lesson recently. He, like many others, is giving a bunch of Koreans ten per cent of his rice crop in return for their watchfulness and labor in irrigation and harvest.

"If I paid them wages, they would quit on the hour, and if a levee should break at night I might lose big money before they would move to save it," says he. "I would have to pay them \$4.25 per day of nine hours, and furnish a cook besides paying the head man \$150 per month.

"Under our crop-sharing agreement, it is seldom during the summer that a man is not out on the levees day and night. They shovel up low places on the levees, set the irrigation boxes, do all the irrigating, pull the water-grass, drain the fields, and help during harvest. They cut by hand the nar-

row parts of checks where binders do not work or low parts which do not drain well. One of them came to me today wanting seed rice to sow by hand where he thought a strip had been washed out. They sow places by hand which have been missed or scraped off. Altogether, I figure that they will grow a ten per cent greater crop than I could grow by hired labor, and thus the irrigation will cost me nothing. They can be depended on to take an interest in my crop."

Another well-known grower of large acreages of rice has other interests which would prevent continual personal supervision. He hires none but Americans and so soon as they show ability to use their heads and hearts as well as their hands on the rice crop, they are given charge of certain acreages and a share in the crop additional to their wages. We saw him hire a man for stipulated pay. Afterward, he told us that this man would be given a share of what he produces, but the man does not yet know it. This rancher has proved his system of profitable profit-sharing by several seasons' experience.

A WADE does 10 mens work Saws 25 cords a day!

A money-maker and hard work saver for land clearers and wood-cutting contractors. One man can move it from cut to cut. Simple and reliable. Hundreds in use all over the U. S. When not in use for wood cutting, the 4 H. P. motor will run mills, feed mills, feed cutters, pumps, etc.

"My Wade Saw is cutting wood for less than 3 cents a cord."—F. J. Williams, Burns, Ore.

"I have sawed through five-foot solid oak logs at the rate of one foot a minute."—N. P. Myers, Linn, Calif.

Quick deliveries from over 100 points throughout the United States.

America must burn more wood for fuel. One Wade will do 10 men's work at one-tenth the cost. Write for free Book, "How Dan Ross cuts 40 cords a day," full details and special price.

349 Hawthorne Ave., Portland, Ore.

MOLINE UNIVERSAL TRACTOR

Saves 1 1/3 Men and 5 Horses Per Farm

Through the most comprehensive tractor survey yet attempted, we have found by figures from Moline-Universal Tractor owners—not by guess work—that the Moline-Universal actually saves an average of one and one-third men and five horses per farm.

Over 200 farmers in 37 states from Maine to California and North Dakota to Texas were closely questioned, and their farms ranged in size from 40 to 800 acres. Every one of the Moline-Universal owners whose data forms a basis for these conclusions was selected at random from our list of owners, so that these results are average—not exceptional.

That the Moline is really a Universal Tractor and fits any size farm is proven by the fact that the farms reporting ranged in size as follows: 8%, 100 acres and under; 37%, 100 acres to 200 acres; 21%, from 200 to 300 acres; 13%, from 300 to 400 acres, and 19% above 400 acres. In their report 76% agreed that they could use the Moline-Universal wherever they used horses, and 83% said they could

do better work—and thereby make more money.

Owners are positive in their statement that the Moline-Universal is a good investment, and 73% of the Moline owners state that they wouldn't farm again without the Moline-Universal Tractor, while the rest say that they would dislike to go back to horses.

In reply to the question, "Can you operate and maintain the Moline-Universal Tractor for what it would cost you to keep three or four horses?" Ninety-two per cent replied "yes." Many reported they could do so for less.

Space does not permit a complete report, but surely these figures must convince farmers and business men who believe in facts instead of theory that the Moline System of Power Farming is the most economical and efficient, and this is the reason why thousands of Moline Power Farmers are making more money with less hard work. Complete report of this tractor investigation will be gladly furnished on request.

Moline Plow Company, Moline, Illinois

PLOWING

CULTIVATING

HARVESTING

Rubbing Elbows with Other Breeders

(Written for Pacific Rural Press by Thos. F. McConnell.)

Anderson Expanding.

Frank B. Anderson, erstwhile newspaper man but now breeder of blue-ribbon Berkshires in the Natomas district north of Sacramento, has achieved success in the face of almost unsurmountable difficulties. Others have succeeded on larger acreages but they had great resources behind them. Mr. Anderson has succeeded largely through his own individual effort under circumstances that would have forced nine out of ten to give up. He has developed a nice alfalfa farm on which is found a beautiful herd of Berkshires—the blue-blooded, stretchy, arch-backed, deep-sided kind that look good anyway or anywhere you find them.

To make Berkshire raising a greater success; to grow the youngsters as rapidly as possible and give them plenty of bone and muscle-building food, Mr. Anderson has started a dairy so that he will have skimmilk and buttermilk. He finds that nothing will quite take the place of these feeds for growing young pigs.

Ayrshires at Norabel Farms.

This herd of blue-blooded registered cattle, located on the hills and rolling land at Valley Ford, Sonoma county, could not be placed in a better section, as it is there possible to grow all kinds of grains and grasses which give the best results for milk production.

There are 60 head of registered Ayrshires in this herd, owned by the Le Baron Estate Co., and under the management of Wm. F. Owens they are showing wonderful results. This is due largely to modern methods introduced by Mr. Owens, who has demonstrated that Indian corn can be grown in abundance for silage. Also, all hay is run through feed cutters and blown into the barns. In this way double the quantity is stored and the hay is eaten better. In fact, Mr. Owens claims that barley cut for hay at the proper stage and put into the barn at the right time is much liked by the cattle and produces a good flow of milk with entire elimination of any trouble from the beads.

Rambouillets at Spears'.

An aged ewe that raises a pair of good twin lambs is certainly doing something to bring down the H. C. L., but when she also clips a fleece of 365 days' growth that weighs 24 pounds, she deserves special mention. This ewe, however, is not the only one that is doing well at the E. C. Spear Estate ranch, St. Helena, as 8 yearling ewes averaged 13 pounds 14 ounces each for an 8 months' growth. Such animals are very profitable when the price of wool is around the half-dollar mark.

Mrs. Spear and her son have most of the ranch in full-bearing prune trees, and at some seasons of the year this orchard furnishes pasture for their Rambouillet sheep. One piece in French prunes had never done very well under ordinary methods of cultivation, but when seeded down to rye grass, alsike clover and alfalfa, and pastured except during a short

period at harvest time, has produced better crops of prunes. There is an unusual condition of sub-irrigation existing that makes this practice not only possible but actually beneficial to the trees.

Yorkshires at Callstoga.

This means the A. L. Tubbs Co., with a beautiful ranch about 2½ miles from town on the Lake county road. Some of the best specimens of the breed on the Pacific Coast are to be found here, and Montelena Prince 2nd is a wonderful hog, both as to conformation and size. He looks as though it would be a very easy matter to make him weigh 1,000 pounds or better.

To those not familiar with this breed it might be well to say that they are white hogs of large size and extreme length, with very strong arched backs, deep sides, compact firm flesh, and furnish a very fine quality of pork and bacon. They are an active breed; they farrow very large litters and the sows are good mothers.

Innisfail Dairy Shorthorns

Dairy or Milking Shorthorns, or Dual-Purpose Shorthorns, as they are sometimes called, are found in all their glory at Innisfail Farm, Suisun, owned by Alexander and Kellogg.

From the young calves up to the aged matrons and bulls are found the very highest types of this great breed. The three herd sires, Glenside Royal, Kelmscott Viscount 19th and Westward Ho, are all of the type desired and strong in the blood lines of the milking strain. Among the matrons Rose of Fairfield 2nd is a beautiful individual; Imp. Lady Beatrice, seemingly somewhat beefy but milking 40 pounds per day; Belleview Daisy, a large red cow with a very straight top, looks good, and there are others too numerous to mention. However, Greenhill Caroline, with a 3-year-old yearly production of 11,636 pounds milk and 429.5 pounds fat, holds the record for the breed at that age and should not be left out of the mention.

When all improvements have been made that are planned this ranch, located on Grisley Island, will be a veritable Paradise for the Dairy Shorthorn. Alfalfa, corn and sorghum for silage, root crops, oats, peas—in fact, almost everything that has ever been grown for cattle feed flourishes here.

Monro Perfect Silo

Ends your silo troubles. Stays round. Stays tight—wet or dry. Easy to build. Absolutely smooth inside. No hoops or bolts to need adjusting or rust away. No upkeep cost. Easy to take apart and remove. Quickly and cheaply enlarged or reduced.

"Money-Maker" Cutters Reduce Your Silo-filling Costs

These are the best all around silage cutters made. They have a shock-proof cushion drive protecting the machine; auxiliary feed roll for feeding uncut bundles of corn from the wagon; springless compression force feed rolls; angle steel frame, plate steel housing, solid base—free from vibration. These are essential features for successful cutting. All machines ought to have them—few do.

SAVE LABOR BY USING HOLSTEINS

Whatever the amount of milk or butterfat you wish to produce, it is not better policy to use large yield cows than to feed and shelter the necessarily greater number of small yield cows.

Use Holsteins and you save labor, feed, stabling, equipment and risk. They are always healthy and ready for work.

Choose cows according to their capacity for converting coarse feed into milk. That is the function of a dairy cow and that is where the big Black and White Holstein excels.

Send for our booklets—they contain much valuable information.

Humboldt Dairying Methods

(Written for Pacific Rural Press.)

"You can preach fall freshening all you want to," said Hon. F. J. Cummings of Ferndale, at the recent annual meeting of the California Dairy Council, "but it doesn't work with us up in Humboldt county. We want our cows dry during the winter months because the weather is then too rough for milking."

Humboldt county is a little empire by itself, and the greatest dairying empire in the United States, having more cows to the square mile than any other section. Also, the dairy-men have made greater progress than those in other parts of California, and Mr. Cummings particularly emphasized the liberal feeding of dry cows to put them in good condition for calving and for a subsequent period of heavy milk production.

Quite a little barley is fed, and it has been found that barley has no tendency to decrease the flow of milk. For succulent feed, silos are gradually finding a place, but at present the

chief feed during the months when grass is short is root crops; in fact, there is no other section of the United States where root crops are so extensively used for dairy cattle as Humboldt county. Carrots are fed heavily in the fall and early winter—often 150 to 175 lbs. per cow daily, and later in the season similar quantities of beets are used.

W. A. Beer, secretary of the Chamber of Commerce at Arcata, said that a large number of milking machines are being used in Humboldt county. Some have been in operation two years or longer and are giving good satisfaction, although they are generally operated by the owners with one or two men following to take care of the milk. Over 100 new machines were installed in the county last year, milking 6,000 cows and supplanting nearly 200 men. "The milking machine is all right," declares Mr. Beer. "Keep it in a sanitary condition and you will get good results."

BIG IMPORTATION OF AYRSHIRES.

The largest express shipment of registered Ayrshires ever brought into the United States from Canada was unloaded at Auburn, California, last Saturday. It consisted of 90 head, purchased by E. B. McFarland of Steybrae Ranch, San Mateo, for division equally between himself and the Penobscot Farm of Cool, Eldorado county.

The Penobscot Farm is the new dairy established by the purchase and combining of the 640-acre Trainor tract and the 160-acre Sharp ranch by Geo. H. Eberhard, F. D. Wilson and associates of San Francisco and Chas. R. Sharp of Cool, who is acting as farm manager. The Ayrshire was se-

lected as being the best for that locality and the existing conditions.

Prof. Gordon H. True of the University Farm, and Geo. E. Platt, D. M. Dorman and G. M. Brown of Los Angeles drove to Cool to view the shipment and to assist Mr. McFarland and Mr. Eberhard in dividing the shipment.

The addition to Mr. McFarland's herd will make it the largest and finest of the breed on the coast. Mr. McFarland has been a consistent winner at the leading coast shows for several years, and is largely responsible for the popularity of the breed in this section.

SAN FRANCISCO LIVESTOCK SHOW FORMALLY LAUNCHED.

A final meeting to launch the San Francisco Livestock Show was held last Tuesday, at which time it was voted to work under the old organization incorporated last year as the California International Livestock Show Corporation. President W. T. Sesnon was continued in office; the selection of Prof. G. H. True as secretary and manager was ratified. The dates of the show will be November 1 to 8, inclusive, and the place for holding the show will be the California Building on the old Panama-Pacific Exposition grounds. The directors are to be the same as last year, with a few changes caused by deaths and resignations. The executive committee named by President Sesnon is as follows: M. H. Esberg, T. W. Diblee, Chas. McIntosh, A. W. Foster, Frank Honeywell, B. F. Schlessinger, R. B. Hale, F. L. Washburn. About \$60,000 has already been raised as a guarantee fund. Now for the big show!

Dependability of the DE LAVAL

Now that "dog days" are with us, it is no time to bother with a balky cream separator.

Dependability in a cream separator is especially necessary in the summer when the milk should be taken care of in the shortest possible time.

The DE LAVAL Cream Separator is dependable, and with ordinary care it will easily last a lifetime.

The DE LAVAL capacity rating is dependable. Each size exceeds its advertised

capacity under ordinary, and even under unfavorable, conditions.

DE LAVAL Service is dependable. Fifty thousand agents the world over see to it that DE LAVAL Separators are properly set up, operated and taken care of. And, above all, the De Laval Company is dependable—the oldest and by far the largest cream separator manufacturers in the world.

More DE LAVALS in use than of all other makes combined.

See the local De Laval agent, or, if you don't know him, write to the nearest De Laval office as below.

ALL STOCK SOLD SINGLY OR IN CARLOAD LOTS.

Carruthers' Sale Breaks Coast Record

(Written for Pacific Rural Press.)

The Pacific Coast beef cattle sales record established last April, when 42 head of Shorthorns sold at the breeders' consignment sale averaged \$693, was beaten by a wide margin at Sacramento July 10, when W. M. Carruthers of Live Oak sold 39 head of Shorthorns for an average of \$820. And this despite the fact that there was no high top to swell the average.

Interest centered in the great bull Hallwood Villager, a prize-winner and a proven sire, and breeders were there from all over the United States to bid on him. He goes back to Kahoka, Missouri, to head the herd of the well-known breeder J. W. McDermott, who secured him for the low price of \$2,700. The great white show heifer, Lady Ruberta, also goes outside the State, being purchased by L. E. Morris & Son of Caldwell, Idaho, for \$1800.

The top female was the sweet two-year-old heifer Countess Lavender, by Majestic Viscount, purchased by C. Harold Hopkins for Conaway Ranch, Woodland, for \$2050. Mr. Hopkins was the heaviest buyer, taking four head for \$4,825. Mayfield Vic-

toria 2nd, another classy two-year-old, was struck off to Wm. Bond of Newark for \$1850. Mr. Bond secured four head in all at a total of \$3,720.

Ed Cebrian of San Francisco secured one of the best bargains of the sale in Broadhooks Sultana 2nd, first prize junior yearling at the State Fair, for which he paid \$1500, and Ormondale Company, Redwood City, were the lucky bidders on Avondale's Gypsy, paying \$1300.

Geo. E. Dierssen, a young breeder of Sacramento, bought 10 head, largely young stuff, for \$4,720. Other buyers were Senator B. F. Rush of Suisun, H. M. Elberg of Woodland, Pacheco Cattle Company of Hollister, Butte City Ranch of Butte City, J. F. Dunne of Gilroy, Foster Bros. of Denver, J. E. Montgomery of Davis, Paul R. Sims of Elk Grove, and Sandercock Land Company of San Francisco.

The sale was cried by Fred Reppert of Decatur, Indiana, with "Scotty" Milne in the ring. W. A. Cotchel, field secretary of the National Association, came out from the East to attend the sale and gave valuable assistance.

Imported Shorthorns for Dibblee Estate

(Written for Pacific Rural Press.)

Manager John Troup of the Thomas B. Dibblee Estate, Santa Barbara, has recently returned from Chicago, where he bought an imported bull and two imported females at the Carpenter & Ross sale, June 24 and 25. Mr. Troup is enthusiastic in regard to the Shorthorn outlook in the East, where he found a very healthy situation.

The bull which Mr. Troup selected is a roan junior yearling, Grand Gallant, bred by J. E. Kerr of Castle Dollar, Scotland. The bull is sired by Sauquhar Grand Gallant, and is out of Imp. Rosamond, a Marr Roan Lady, sired by Prime Favorite. Grand Gallant is a full brother to the bull which sold last year for \$12,000 to Mr. Thomas of Kentucky.

One of the females is Imp. Bright Bessie of Collynie, the only Duthie bred cow that has ever come to California. She has a bull calf at foot sired by Maxwalton Minstrel. Her year-old bull calf, Imp. Scottish Lord, was bought for T. S. Glide of the Hillcrest Stock Farm, Davis, to head his herd. The other female purchased by Mr. Troup was Imp. Cecilia, bred by Lady Cathcart of Cluny Castle, Aberdeenshire, Scotland.

Mr. Troup while in the East visited Frank Harding's Anoaka Farms at Waukesha, Wisconsin, with Ed Cebrian, who had successfully bidden several times on the high-priced bulls at the sale. They found Mr. Harding's cattle in excellent condition, with many nice young prospects of calves coming on for his next sale. Mr. Troup was much taken with Mr. Harding's bull Lavender Sultan, which he considers one of the great bulls of the breed. He also visited the Meadow View Farm of McMillan & Mc-

Millan at Lodi, Wisconsin, where he bought a young Rosewood bull sired by Village Marquis, he by the great bull Villager. Mr. Troup considers this one of the choice herds of the breeds, as the McMillans only buy animals of the best breeding and individuality. A general desire all over the central west was noticed for better animals. With breeding and quality, the price seemed no object, but animals with inferior breeding and individuality were not much sought.

Mr. Troup is fitting a fair-sized herd to show at the State Fair. Despite the disadvantage of distance he is ready to "throw his hat into the ring." He has visited several of the leading herds in the State and believes that after the awards are made he will feel like throwing his hat into the air.

HALF RATES FOR SHOW STOCK.

The Railroad Administration has recently issued new rules governing the transportation of livestock to shows and fairs, which amounts to a half rate. The exhibitor must pay the full rate on his stock in shipping to the fair, and the ruling provides for free return provided the bill of lading is accompanied by a certificate from the secretary of the fair stating that the animals were exhibited and that they have not changed ownership. The animals must be returned within 30 days of the close of the fair.

When a circuit of shows is included the animals will be way-billed at the regular rate to each show, and at the close of the show the certificate from the secretary that he animals were shown there and that no change of ownership has occurred must be presented to the railroad authorities, who will then reduce the in-bound charges to half the regular rates. When the animals are shipped home from the last point on the circuit, half fare rates will again be charged.

However, the administration agrees to these half fare rates only when the liability is limited to specified sums, which are very low for registered animals, the limit on bulls being \$75. Consequently, it will be necessary for exhibitors to either run their own risk or carry insurance.

The daily market reports which have been issued by the Bureau of Markets have been discontinued and the bureau's work will be crippled in other directions, including the closing of several offices. Economy in government expenditures is given as the reason; but in connection with the livestock and meat industries the Bureau of Markets has proved by results that it deserves to be continued.

Globe "A-1" Swine Feeds —with dry buttermilk

Three kinds, one for baby pigs, one for growing pigs, one for fattening hogs. Scientifically compounded to suit age of animal. All kinds contain real health-giving dried buttermilk, in correct proportion to make animal grow, mature rapidly and take on a load of profit-making fat. Ask your dealer.

Globe "A-1" Stock Feed —with molasses

A well-balanced ration containing the proper amount of such concentrate feeds as soya bean meal, milo maize and other grains in combination with chopped alfalfa and desiccated bean straw. The whole ration treated with heavy addition of Hawaiian cane molasses. Palatable, nutritious—a winner either as a dairy or a fattening feed.

Globe "A-1" Dairy Feed

A high-protein concentrate to balance roughage available on your ranch. All we ask you to do is to weigh up the milk before and after feeding this remarkable feed for a few weeks.

Get the FACT BOOK FREE!

—here is a book you cannot afford to be without. Practical, sensible—a sane talk by experts who know how to raise poultry, swine and stock. Write for it now.

APPLETON Silo Filler

Better Silage Pays

It's the kind of silage that you make that really counts. The Appleton Silo Filler is built to make more appetizing and nourishing silage, because it cuts clean and even—no shredding. Every pound that goes into the Silo packs more firmly and airlessly, insuring a rich, succulent feed the year around, that makes stock thrive.

The wonderfully efficient, heavy, spiralled knives and adjustable cutter bar of the Appleton, are without an equal for delivering the even, cylinder-cut silage that insures 100% feed-value. The movable cutter bar enables you to adjust for clean-cutting under all conditions. The Appleton can be made to cut 10 lengths, from 5/16 to 2 1/2 inches.

In addition to making better silage, the Appleton does more work, more safely, quickly and easily, on less power. Write for our free booklet, and learn all about the other Appleton advantages, such as: simple, strong operating construction; auxiliary web-feed and big throat that save labor and time in feeding; traveling feed-table on power-saving, frictionless rollers; safety device that minimizes danger and damage, etc. 4 sizes, for 6 h.p. and up. The Appleton copes with all farm conditions.

Cebrian Secures Great Shorthorn Sires

(Written for Pacific Rural Press.)

California now has the proud distinction of being the home of what leading Shorthorn breeders have pronounced the best bull in both breeding and individuality that was ever brought to this country. His name is Imp. Caledonia and he was recently purchased in the Middle West by Edward Cebrian for his ranch near Sacramento.

It will be remembered that several months ago Mr. Cebrian bought the noted Palcines Rancho herd of 400 registered Shorthorns. Field Secretary W. A. Catchel of the Shorthorn Association visited the herd on his recent trip to the Coast and pronounced it the finest large herd in the country. It included the good sire, Pine Grove King, by the International grand champion, King Cumberland, but Mr. Cebrian decided that he must have the best bull that money could buy, so he scoured the entire middle-west and found in Imp. Caledonia just what he was looking for.

This bull, a three-year-old roan, was imported by Carpenter and Ross, and is by Proud Emblem, a Duthie bred bull that sired the top calf at the Scotland sales last year, being purchased by Mr. Duthie for a herd bull at \$20,000. Caledonia is out of the great Rosewood cow, Rosewood 105th. Wm. Anderson, of Scotland, considered her the best cow in his herd and expected to keep Caledonia for a herd bull. But he was brought to this country, where he topped the 1917 Carpenter and Ross sale at \$7,500—a record price at the time. He is a proven sire of great worth, and it was his wonderful crop of calves that particularly appealed to Mr. Cebrian. He considered them the best he saw in all his travels.

But a large herd needs more than one good bull, so Mr. Cebrian secured another corking good one in Gainford Matchless, of the noted Matchless family. He is by Imp. Gainford Marquis, considered the best breeding bull ever imported into Canada. Gainford Matchless, another

roan, won first as a senior yearling at the Chicago International last year, weighing 2,100 pounds at the time. He was considered a likely prospect for the championship at the International this year, and undoubtedly will make a local record for himself at the fairs this fall, as Mr. Cebrian expects to show him.

Mr. Cebrian paid \$25,000 for the two new bulls, but not being quite satisfied he bought also the roan bull calf Select Sultan, by Selection, he by Avondale. The dam of the calf is Village Bell 2nd, by Fair Acres Sultan, second dam by Villager, third dam by Golden Favorite. Some breeding!

The entire beef cattle industry of the coast is benefited by Mr. Cebrian's importation. He is developing his ranch and his herd in a scientific business-like way, and unless we miss our guess the Caledonia Farm, as it will be called, will be one of the leading Shorthorn breeding establishments in America.

LOS ANGELES LIVESTOCK SHOW.

The Los Angeles Livestock Show is now a sure thing. It is being backed by the leading men of the southern end of the State; C. R. Thomas has been made manager; the dates—October 18 to 26—have been claimed, and premiums amounting to \$33,000 are being offered. There will be classes for beef and dairy cattle, hogs, sheep, draft horses, saddle horses, driving horses, mules and jacks, ponies, goats, poultry, pigeons and rabbits. The premium list will be out soon and a copy may be obtained by writing Mr. Thomas at the Chamber of Commerce Building, Los Angeles.

BUTTE CITY RANCH SALE.

There is one sure thing about stock raised at the Butte City Ranch. The animals are grown under natural conditions and are not pampered. Consequently, they make good for those who buy them.

On Saturday, August 2, the second annual sale will occur at the ranch, and 50 registered Shorthorns, 125 registered Shropshire sheep, 50 registered Berkshire hogs and 10 Shetland ponies will be offered. Some of the most noted families of the respective breeds will be represented by individuals fully worthy of their breeding. The offering throughout will consist of prime young animals in vigorous, thrifty condition, that will prove profitable investments to their new owners.

BUTTE CITY RANCH

Owned by W. P. DWYER and W. S. GUILFORD

Butte City [GLENN COUNTY] California

Second Annual Sale

SATURDAY, AUGUST 2, 1919

50 REGISTERED SHORTHORNS

38 FEMALES—12 BULLS

Practically all of these good Shorthorns are sired by such well-bred bulls as Victor Stamford, Vermillion, Gloster Archer, Roan Chancellor,

Crescent Dale, Gibson's Goods, Ringleader, Perfection, and Sir Type.

There are some great cows with calves at foot, bred and open heifers, and some choice heifer calves. The bred females are all in calf to the Butte City Ranch herd sire Victor Stamford, he by one of the best sons of Whitehall Sultan and out of a Stamford dam.

The young bulls in the sale are of uniformly good type and are in vigorous, thrifty condition. Breeders and rangemen will find a choice selection.

Every young animal in the lot is permanently immunized against blackleg by Purity Blackleg Aggressin made by the Kansas process.

125 REGISTERED SHROPSHIRE

35 MATURE EWES—35 EWE LAMBS

35 YEARLING RAMS—20 RAM LAMBS

These Shropshires constitute the most favorable buying opportunity ever yet afforded in a California sale. The owners of Butte City Ranch realize fully the importance of the farm flock to most California farms, and have selected some of their very best for this sale in order that those

about to establish farm flocks may secure the most desirable foundation stock. These Shropshires represent Broughton, Cavendish, Minton, and Wardwell breeding, and are not only of pleasing type but are also in splendid condition.

50 REGISTERED BERKSHIRES

Possibly in no previous sale of Berkshires in California has there been offered such a uniformity of breeding. The entire offering is sired by two boars, Onward 4th, who is by the world famous imported English boar Epochal and out of the imported sow Compton Dulce, and Butte City Leader, who is by a son of the world's grand champion boar Grand Leader 2nd. The excellent gilts and young boars in the sale are growthy individuals of high average type, and out of some of the best brood sows ever owned at Butte City Ranch.

Every Berkshire in the sale is permanently immunized against hog cholera by Purity Hog Cholera Serum and mixed vaccine.

10 SHETLAND PONIES

Shetland ponies from Butte City Ranch have delighted scores of youngsters, who have purchased from them and the owners have selected some of their very best ones for this sale.

Sale Starts Promptly at 9 a. m.

Livestock and Dairy Notes

Livestock breeders all over the state are invited to send on postal cards, notes regarding their sales, State and County Fair intentions, new stock, etc.

LIVESTOCK SALES DATES.

August 2—Butte City Ranch, Butte City. Shorthorn cattle, Berkshire hogs, Shropshire sheep and Shetland ponies.

August 6—Francis T. Underhill, Santa Barbara. 100 head Hampshire hogs.

August 26—Fresno County Poland-China Breeders' Association, Fresno. Consignment sale of bred sows and gilts.

September 17—John M. Bernstein and W. L. Haag & Son, Hanford. Poland-China bred sow sale.

October 4—H. I. Marsh and Les McCracken, Modesto. Poland-China bred sows and gilts.

October 7—M. & A. L. Bassett, J. A. Crawshaw and F. D. Ross, Hanford. 75 head of Poland-Chinas.

October 16—E. M. Elberg, Roselawn Stock Farms, Woodland. 45 head of Shorthorns.

October 18—Trehwhitt, Vaughan and Nehls, Hanford. Poland-China bred sows and gilts.

October 20—Tulare County Poland-China Breeders' Association, Tulare. First consignment sale.

November 7—Pacific Coast Hereford Breeders' Association, San Francisco. Third sale of Herefords.

The Dairy.

Pecho Ranch and Stock Company showed a yearling bull calf at the San Luis Obispo Livestock Show that looks like the coming Holstein bull of that section. His dam has a 7-day record of 26.09 pounds and a yearly record of \$15.38 pounds. He is by King Korn-dyke Pontiac.

H. M. Warden, San Luis Obispo, showed a Holstein bull at the San Luis Obispo Livestock Show that carries 37½% blood of the noted cow Duchess Skylark Ormsby. He also showed two fine three-year-old heifers with records better than 21 pounds in 7 days.

Helena of Sunnyside, a junior two-year-old Holstein in the Sunnyside herd of R. F. Guerin, Visalia, has just completed a 7-day record of 20.32 pounds from 408 pounds milk. She is the first daughter of Sir Veeman Korndyke Pontiac to freshen, and naturally Mr. Guerin is delighted. He has 30 more of his daughters and is expecting great results from them.

It is reported that the Co-operative Creameries at Visalia, Porterville, Tulare, Riverside and Caruthers have been taken over by the San Joaquin Valley Milk Producers' Association. Plans are under way for centralization of manufacturing, extension of markets and elimination of unnecessary equipment. A \$250,000 by-products plant is contemplated at Tulare.

Dean Beeman of Woodland has a wonderfully fine herd of Holsteins, headed by a great young bull Dean Fayne Segis. This sire is not only a wonderful individual but a very well bred animal, as his 16 nearest dams average 29.56 pounds of butter for 7 days. He has 5 century sires, 126 30-pound cows, 9 40-pound cows, and 1556 A. R. O. cows in his tabulated pedigree. The average per cent of fat of his 7 nearest dams is 4.48.

Swine and Swinememen.

Prof. J. I. Thompson of the University Farm has been selected to judge Berkshires at the International Livestock Show at Chicago next winter. They couldn't make a better selection.

F. M. Johnson of Napa has sold \$1,400 worth of registered Duroc hogs as the result of \$26.70 invested in Rural Press advertising since February. A pretty convincing illustration of the value of printer's ink.

HOLMES STOCK FARM

WATERFORD RD., MODESTO, CALIF.

Registered Holstein Friesians.

YOUNG SERVICE BULL FOR SALE

Prince Abbecker Arilla Walker, No. 204267—Three-quarters white.

Write for pedigree and price. Inspection invited and satisfaction guaranteed.

Calf Profits

Are you getting them? Calf profits mean more to you now than ever before.

Blatchford's Calf Meal

Has been known since the year 1800 as the complete milk substitute. Costs less than half as much as milk—prevents scouring—promotes early maturity. Sold by dealers or direct from the maker.

Write for New Data. See actual figures showing you how to increase your calf profits.

COULSON CO. - - - Petaluma, Cal.

Walter Burnell, the herdsman at Jack London Ranch, Glen Ellen, says that business in the swine department has never before been so brisk, and gilts that they had expected to hold until fall and sell bred have gone like hot cakes.

The pig crop this year is only about 70% normal according to the Bureau of Animal Industry. The shrinkage is attributed to loss in pigs caused by the wet weather which prevailed throughout the east and middle west during the spring months.

W. Bernstein of Hanford purchased from H. D. Blackburn of Illinois about two months ago the young Boar Kings Big Ben, sired by the noted Big Ben. He is coming along in fine shape and promises to develop into one of the leading boars on the coast.

W. F. Sandercock of the Natomas District, Sacramento, has sold to Moore Brothers of Zionsville, Ind., a sow pig sired by Baron Duke 201st and from Princess Leader. The pig combines the blood of two world's champions and one grand national champion.

J. Francis O'Connor of Castlevue Ranch, Santa Rosa, being desirous of giving his registered Berkshires the best possible advantages, has established a small dairy herd. Starting with some grades and a few registered Holsteins he expects to gradually work into an all registered herd.

Lea Bleakmore of San Francisco, owner of Oak Knoll Farm at Lakeport, reports great interest here on the coast in Chester Whites. He is receiving a large number of inquiries and is making many sales. The Chester White is a great hog and Mr. Bleakmore is building up a wonderful herd.

The recent sale for a long price of the junior yearling Poland-China sow, Model Valley Sensation, is reported by Mrs. Viola L. Renwick of Santa Barbara to W. H. Green, Pattinay; also a boar pig, Mammoth Price, sired by Longfellow Price out of Big Helen. Mr. Green is to be congratulated on acquiring two such excellent animals.

Paul E. Mitchell, Poland-China breeder of Atwater, has recently made the following sales: Service boar to W. H. Osborn; 2 boar pigs to Albert Bispo; sow pig to Mrs. L. J. Dessel, Atwater; 2 sow pigs to J. P. Petersen, Chowchilla; boar pig to Geo. H. Burns; boar pig to S. H. Allen, Merced; sow pig to Elwood Mitchell, Selma.

Geo. L. Horine, Duroc breeder of Winton, has sold within the past few days 2 gilts to A. H. Lacey, Butte county, 3 sow pigs and 1 boar pig to D. Augustine, Contra Costa county, and 1 bred gilt to Joe Enos, Merced county. Mr. Horine is offering stock on a basis whereby farmers who are only raising hogs for pork cannot go without a pure-bred sire.

At the Trehwhitt, Vaughan and Nehls sale of Poland-China bred sows and gilts, which is scheduled for October 18 at Hanford, C. A. Vaughan will offer 10 of the fine big-type gilts that he procured in the east, and W. D. Trehwhitt will sell 40 sows and gilts all bred to Model Jones or Iowa Wonder. The Trehwhitt stock is mostly of Pfander breeding and Mr. Trehwhitt says that the offering will represent the best lot of real big-type females ever sold in California.

Beef Cattle.

Thornton S. Glide of Hillcrest Stock Farm, Davis, purchased a new herd header at the world record Shorthorn sale of Carpenter & Ross, at Chicago, June 24 and 25. The bull, Imp. Scottish Lord, is a yearling out of the Duthie bred cow, Imp. Bright Bessie of Collynie, purchased at the same sale by Thos. B. Dibblee Estate of Santa Barbara.

Sheep.

D. M. Wheeler of Santa Rosa, breeder of Shropshire sheep, says that in Fresno county many sheep are pas-

tured in the vineyards after the grapes are gathered, much to the benefit of both vineyardist and sheepman, but that the grapemep about Santa Rosa will not rent their vineyards for this purpose claiming injury to the soil through tramping of the sheep. Mr. Wheeler thinks this a mistaken idea and that grape growers should awaken to the fact that they are losing quite a sum by refusing pasturage at this period.

W. P. Harris of Holtville says that in the Imperial Valley 10 head of sheep can be kept on an acre of alfalfa; that 120 lambs will make \$1,000 clear in six months; that a six months' clip in April will run from 6 to 7

pounds per head; that 160 acres will maintain 2,200 sheep throughout the year, or 4,000 sheep during the summer alone; that it is necessary to have one ton of hay for every 15 head of sheep during the winter. However, Mr. Harris plants barley in his alfalfa in October and has green feed for his sheep all winter.

Miscellaneous.

The premium list for the State Fair to be held in Sacramento August 30 to September 9 is ready for distribution and copies can be obtained by writing to Secy. Chas. W. Paine, Sacramento. The premiums this year will total \$45,000.

Pork Production

BY ACTUAL TEST PURE HAWAIIAN CANE

MOLASSES

will increase pork production approximately five-tenths pounds daily over a barley and tankage feed, yet it sells for less than half the price. Do you know of any other feed at any price that will do this?

Why not get all the profits out of your hogs?

Write us immediately for a copy of above test.

YOUR INVESTMENT RETURNS 100% EVERY YEAR

Costs of modern farm equipment, as with other productive industries, must be figured with regard to the returns in profits. Some silos may have proven money losers; over 70,000 successful users of the

INDIANA SILO

back theirs as money-winners.

To the extra meat and milk profits, and the saving of more expensive feeds, add the extra savings that the Indiana silo makes for you in less spoiled silage. The total is your yearly profit on the Indiana.

The airtight, convenient Indiana doors (patented), the special Indiana tongue-and-grooving of the seasoned No. 1 fir staves, the proven Indiana method of holding the silo in shape and the walls tight and straight with adjustable iron hoops—these features keep silage in the Indiana free from rot, mould and freezing—make it more succulent and nourishing.

Without an Indiana you pay for one every year in less milk and meat profits. Why not have one next season? Now is the time to build and be ready.

HIDDEN VALLEY FARM offers for sale 2 young Guernsey bulls, ready for service, out of high record advanced register dams. A. J. Welch, proprietor, Redwood City, California.

EDGEMOOR FARM GUERNSEYS—First in the show ring and in official records. A few choicely bred bull calves for sale. Edgemoor Farm, Santee, San Diego county, Calif.

PALO ALTO STOCK FARM, Palo Alto—Breeders of registered Guernseys; both sexes; prices reasonable.

Jerseys.

SUNSHINE FARM JERSEYS—Tuberculin tested. Production counts. E. E. Greenough, Merced, California.

Milking Shorthorns.

DUAL-PURPOSE SHORTHORNS—Registered and unregistered bulls and heifers. Two unregistered 2½ years old range bulls. Chas. L. Weaver, Tulare, Cal.

BREEDERS OF REGISTERED SHORTHORNS—Milk strain; choice young stock for sale. John Lynch Ranch, Box 321, Petaluma.

INNISFAIR DAIRY SHORTHORNS—Registered young bulls for sale. Alexander & Kellogg, Suisun, California.

Holsteins.

A PRICE ON EVERY ANIMAL.

Herd free from tuberculosis. All sales subject to sixty days' retest. Sons of Finderns Soldene Valdesa, whose dam is not only a world record cow in seven-day division, but has two sisters holding world's records for yearly production.

Toyon Farms Association.

679 Mills Building San Francisco.

YOUNG HOLSTEIN BULLS—Excellent breeding and individuals. Satisfaction guaranteed. Pecho Ranch and Stock Co., San Luis Obispo, Calif.

PALO ALTO STOCK FARM, Palo Alto, breeders of registered Holsteins. Heifers and service bulls. Reasonable prices.

REGISTERED HOLSTEIN BULLS with world's record backing. Kounias' Registered Stock Farm, Modesto, California.

REGISTERED HOLSTEIN CATTLE—E. M. Freeman, Route B, Modesto, California.

EL DORADO HERD OF HOLSTEINS—Alex. Whaley, Tulare, California.

CREAMCUP HERD—Registered Holsteins, Pontiac bull calves. M. Holdridge, Rt. A. Box 437, San Jose, California.

YOUNG HOLSTEIN BULLS—2 to 5 months old—Tilly Alcarra blood—for sale. A. Swensen, Box 192, Livingston, Cal.

F. H. STENZEL, SAN LORENZO, CALIF.—Breeder of Registered Holsteins. High test producers.

THE VICTORY HERD—Registered Holstein cattle and Duroc Jersey swine. H. E. Spires, Hilcrest Farms, Caruthers, California.

REGISTERED HOLSTEINS—Young stock for sale from A. R. O. dams. La Driver Stock Farm, Nicolaus, Cal.

REGISTERED HOLSTEINS—Best blood lines of the breed. R. L. Holmes, Modesto, Cal.

REGISTERED HOLSTEINS—We breed for production. Leeman and Kilgore, Ripon, Cal.

J. W. BENOIT, Modesto, Calif.—Breeder of registered Holsteins.

GOTSHALL & MAGRUDER—Breeders of registered Holstein-Friesian—Ripon, Calif.

CHOICE HOLSTEIN bulls for sale. No females. Milbrae Dairy, Milbrae, California.

HOLSTEIN BULLS and bull calves from A. B. O. cows. C. A. Miller, Ripon, California.

REGISTERED HOLSTEINS—A. W. Morris & Sons Corp., Importers and Breeders, Woodland, California.

REGISTERED HOLSTEINS and Duroc-Jerseys. Sturgeon Stock Ranch, Tulare, Calif.

BEEF CATTLE.

RANCHO SAN JULIAN SHORTHORNS—Purebred range bulls, unregistered, for sale. Estate Thos. B. Dibblee, Santa Barbara Co. Lompoc, Calif. John Troup, Supt.

ALAMO HERD REGISTERED HEREFORDS (founded by Governor Sparks). Herd and range bulls. Reasonable prices. W. D. Duke, Likely, Modoc county, California.

REGISTERED YEARLING SHORTHORN BULLS—Heavy-boned, thick-meated. Scotch and Scotch-topped breeding. Ormondale Co. Route 1, Redwood City, California.

REGISTERED MILK AND BEEF SHORTHORNS, bulls and heifers for sale; catalogue free. Thomas Harrison, Santa Rosa Stock Farm, Santa Rosa, California.

HEREFORDS—Sierra Vista Herd, Minturn, California. Over one hundred registered animals. Fairfax and Repeater bulls head the herd. On highway.

SHORTHORNS—Carruthers Farms. Live Oak California.

HOPLAND STOCK FARM—Registered Short horns. Prices on application. Hopland, Calif.

REGISTERED HEREFORDS—H. H. Gable Diamond G Ranch, Esparto, California.

THE NEVADA HEREFORD RANCH, Jno. H. Cazier & Son Co., Props., Wells, Nevada Registered Hereford cattle. Breeding stock for sale.

SIMON NEWMAN CO., breeders of Registered Hereford Newman, California.

HEREFORDS—Mission Hereford farm, J. A. Bunting, Prop., Mission San Jose, Cal.

GEORGE CALLAHAN, breeder of registered Herefords Milton California.

REGISTERED SHORTHORNS—Fair Oaks Ranch, Willits, Calif.

GEORGE WATTERSON—Breeder Registered Herefords. Bishop, California.

REGISTERED SHORTHORNS—Julien Ranch, Grenada, Siskiyou Co., California.

HORSES AND MULES.

A WELL-MATCHED TEAM of black mares; also extra mare; three two-year-olds, and four yearling colts; all of Percheron stock. J. Bernard, Calistoga, Cal.

FOR SALE—A-1 Breeding Jack. Bargain. Have quit raising mules. W. P. Harkey, Gridley.

PERCHERONS—Registered Stallions, Mares and Fillies; three, four, and five years old. Cora S. Seacrest, Escalon, Cal.

SHEEP AND GOATS.

PURE-BRED RAMBOUILLET RAMS, large smooth frames, extremely heavy shearers, from the very best strains of this country and France. Immediate delivery from ranch at Ord Bend, Glenn county. P. O. address, Windell Orchards, Glenn, Calif.

F. A. MECHAM ESTATE, Petaluma, Cal.—Breeders and importers of Shropshire, Rambouillet and American Merinos, both sexes. Also Red Polled cattle. Take electric car at Petaluma or Santa Rosa for Live Oak Ranch.

HAVE FOR SALE fifty head of fine yearling Shropshire rams. Also 25 head of high-grade Rambouillet rams. These are big fine woolled rams. E. D. Dudley, Dixon, Calif.

500 GOOD TWO AND THREE-YEAR-OLD breeding ewes for sale, in good order. Write James J. Connell, 399 North 3rd St., San Jose. Phone 3763.

J. R. BLOOM, DIXON, CAL.—Breeder of Shropshire rams out of pure blood ewes and imported registered rams. Single and car load lots.

SHROPSHIRE—43 yearling, purebred, registered Shropshire rams for sale. Harry L. Huston, Winters, Calif.

DORSETS AND ROMNEYS—Dorset ram lambs for sale. John E. Marble, South Pasadena, California.

BULLARD BROS., Woodland, Calif. Breeders and importers of Rambouillet sheep.

BISHOP BROS., SAN RAMON CALIF.—Breeders and importers of Shropshires.

KAUPKE BROS., WOODLAND, CALIF.—Breeders and importers of Hampshire sheep.

CHAS. KIMBLE—Breeder and importer of Rambouillet. Hanford, California.

WANTED—52 two-year-old Shropshire ewes. Route 1, Box 8, Cloverdale.

CALLA GROVE FARM, MANTECA, CALIF.—Breeders and importers of Hampshire sheep.

MISCELLANEOUS.

BUTTE CITY RANCH—Shorthorns, Shropshires, Berkshires and Shetland ponies. Write for prices and descriptions before buying. Butte City Ranch, Box P. Butte City, Glenn county, Cal. W. P. Dwyer and W. S. Gullford, owners. Special Notice: Second Farm Sale. Shorthorns; Shropshires; Berkshires; Ponies. August 2, 1919.

Epoch-Making in Hampshire Circles

(Written for Pacific Rural Press.)

August 6 promises to be a red-letter day at Santa Barbara when the first public sale of pure-bred Hampshire hogs in California will be held by Francis T. Underhill on his Ortega-Underhill Ranch.

When hogs were first brought into the United States there were practically none of the conditions and problems that are today big items to the producer of pork. But now there have arisen the problems of economical feeding, the saving of labor and the producing of a hog that will be in demand because of its fine cutting qualities. The solving of them is a necessity to make the production of pork a paying proposition, and it is claimed that the Hampshire hog is the animal that can do the trick.

The Hampshires did not gain quick prominence after being imported to this country. Hampshire growth has largely been accomplished in late years; in fact, their increase of popularity in the last five years has been sensational, and it is the talk and wonder of the livestock growers in every section of the United States how the Hampshire has pushed to the front in so short a time.

What is the reason of this great growth in late years? Why is it that so many want Hampshire stock to produce their pork? There must be some sound reason for it. To make a long story short, it is merely the fact that these producing problems had got to a place where they had to be solved, and the Hampshire hog came forth and solved them. Some may say that it is merely the men who are pushing them and their advertising of the breed that is responsible for it. But admitting that the right kind of advertising will help sell an article, it is an absolute certainty that if you do not deliver the goods, the article you are selling will not "get by" for any length of time. Nor will it gain a popularity and hold it through the storms and buffeting of opposition, as the Hampshires have done in the livestock world of today. Its breeders claim that the credit must be given

to the hog—the belted beauty that delivers the goods.

The opportunities for the growers of hogs in California are indeed golden. The possibilities for the men who wish to accomplish things are unlimited. And the man who begins now has a running start; he has the advantage of being one of the first in the field. Imagine the advantage a few years from now when California will be one of the leading states in the production of hogs. And such can be the case in a very few years if the ranchmen and farmers take advantage of their opportunities.

Especially are the Hampshires adapted to the conditions of this State. They are an ideal hog for California. For instance, alfalfa, one of the most valuable feeds in the State and one of the most plentiful, is also one of the most valuable feeds for Hampshires. They are a foraging, green feed hogs. They are hardy rustlers and will get out after such feeds where the more lazy breeds will not do so. In the Middle Western States they are called the poor man's hog because of their ability to live on pasture feeds, and their rapid response to the fattening feeds when on is in a position to get them ready for market.

At the Underhill sale of 65 bred sows and gilts breeders will have the opportunity of getting their Hampshire foundation stock, of meeting and becoming acquainted with the other breeders of this State and Eastern hog States, and of attending a meeting of the breeders of California for the purpose of organizing a California Hampshire Breeders' Association. A large barbecue will be held and all interested are invited to attend. A cordial welcome is assured.

NEW HARNESS

is cheaper than second-hand, dollar for dollar of cost. Come in and see what we have to offer you in **HERCULES HARNESS**, Saddles, and Horse Collars. Our own make and fully guaranteed.

W. DAVIS & SONS

California's Pioneer Harness Manufacturers

338 Market St., SAN FRANCISCO
427 J. St., SACRAMENTO

Catalogue of Harness, Saddlery, Trunks and Traveling Bags sent free on request.

Live Stock Profits

are directly dependent upon the general health of herds and flocks. Not all live stock diseases can be controlled or cured, a fact that justifies owners of livestock taking advantage of every proven method for eliminating possible risks.

PURITY BIOLOGICAL PRODUCTS (not always cheapest but always best) offer the greatest protection against certain diseases.

Purity Blackleg Agglutinin—Germ Free Vaccine—produced by the Kansas method. One treatment immunizes for life. Being germ-free its use will not introduce blackleg into healthy herds. Over 1,500,000 calves vaccinated without loss.

Purity Anti-Hog Cholera Serum is the most extensively used in the world.

Purity Mixed Vaccine for Swine prevents Swine Plague and Necrotic Enteritis.

Purity Hemorrhagic Septicemia Vaccine for cattle and sheep prevent Hemorrhagic Septicemia and reduce losses in infected herds.

We are prepared to offer the highest degree of service—service that counts, and does not end with selling. Correspondence and consultation invited. Write, wire or phone.

PURITY SERUM COMPANY

J. L. Thatcher, Manager
(Successor to Thatcher Serum Co.)
Riverside, Calif. Sacramento, Calif.

There is no excuse for a filthy hog trough where a sanitary one can be provided. The sanitary kind can be made either of cement or cast iron and they are not expensive. But even these will not avail or lessen the danger to the hogs from disease unless they are persistently and thoroughly cleansed, but they are so much easier to care for and keep clean that it is simply bad business to bother with the old kind.

Wonder how many valuable young boars will be killed this season by being overfed. It seems to be necessary to beat the other fellow, so there you are.

Consider the Brood Sow

(Written for Pacific Rural Press.)

The motherly qualities of a brood sow are to be considered an asset, just as definitely as are like qualities in dairy cows.

The feeding and care of a brood sow before she is bred, and while she is carrying her litter, bear a direct relation to the size of the litter and the strength of the pigs.

The young pig is a highly protein product; consequently, an abundance of protein should be provided in the feed. A sow cannot produce something from nothing.

Phosphate of lime is an essential feed for sows carrying litters, to provide for the development of bone in the pigs, and to maintain her own strength of bone. This can be supplied in wood ashes, burned cobs, charcoal and bone meal.

Keep your brood sows in good thrifty condition, but not fat. Plenty of exercise will prevent excessive fatness and keep them in proper condition.

Watch carefully the condition of the sow's bowels while she is carrying her young, and especially just before farrowing. She is naturally feverish at this time, and this tends to constipation, which in turn causes difficult farrowing. Keep the bowels open by feeding laxative feeds, but do not use a violent purge, as this might cause abortion.

Provide clean, dry, comfortable quarters for the sow at farrowing time, free from drafts. Pen her a few days in advance, and gentle her so that you can move around without disturbing her.

If the sow has had plenty of exercise and is not costive, she will have little trouble in farrowing, but it is well to be on hand to help her out if necessary.

Warm water with a handful of bran or shorts is all that should be given the sow for the first twenty-four hours after farrowing. After that, increase her feed very slowly. Be careful about forcing the milk too soon, as the pigs are unable to take care of much at the

start. If the sow has too much and some is left in the udder, it is liable to congest and cake, and serious consequences will result to both the sow and the pigs. Use at least ten days in bringing a sow to her full feed.

Give sows that are suckling pigs plenty of milk-producing feed. The cheapest gains are made by young pigs. Middlings come high, but pay at this stage of the game.

Use caution in changing the feed of the brood sow while she is suckling her litter, for any sudden change in the feed is liable to cause scours in the pigs. Make all changes gradually. Refuse and garbage often cause pigs to scour, and it is better to use such feed for shoats.

Keep the sow and pigs exercising every day, and don't let the pigs get too fat or thumps will develop.

Watch the young pigs and look after the tusks before they have done any damage. They start on a war basis right after birth, and begin scrapping for positions at the lunch counter. Remove the tusks and deprive them of their only weapons. It will be a benefit to them, their mates, and their mother, as blood poisoning is liable to infect the wounds made by the teeth. Use small tweezers and snap the tusks off.

Grand Champion Herd of Hampshires

704 Townsend St.,

San Francisco

CALIFORNIA'S FIRST HAMPSHIRE SALE

YOU have heard about the sensational rise of "America's most popular hog." You have heard of his wonderful money-making qualities; of his record at the 1918 International, where the lot shown below won grand championship over all other breeds and sold for \$2.25 per hundred above the nearest competitor.

Now you have the opportunity to secure animals of the best blood lines in America at your own prices. Mr. E. C. Stone, the leading Hampshire authority, says that Francis T. Underhill has given more thought to the foundation of his herd than any other man in Hampshire history; that Mr. Underhill has three of as good herd boars and as fine a lot of sows as he has ever seen; and that the stock to be offered at this sale is far superior to the average consignment at middle-west sales.

65 Bred Sows and Gilts

Four 3-year-old sows, 24 2-year-olds, 21 yearlings, 17 fall gilts. All guaranteed safe with pig; most of them carrying their own guarantees. Everything royally bred and from four great blood lines—Gen. Tipton, Lookout, Gen. Allen and Cherokee Lad. You can't beat this breeding.

The boars to which the sows are bred include Gen. Tipton's Masterpiece, the best son of the grand champion; Exalted Ruler, a Lookout boar by Exalted Lad, 1918 grand champion of Iowa; Draper Laddo, a Cherokee Lad boar; and Gen. Allen's Counterpart, by Gen. Allen, undefeated grand champion.

Wednesday, August 6th

Sale will be held at the Ortega Underhill Rancho, 4 miles east of Santa Barbara on the Coast Highway, near Montecito. E. C. Stone will be there. A State Hampshire association will be formed in the morning. Free barbecue. Come, whether you intend to buy or not. A good time assured. For catalog, information and free literature, address Walter Folk, western representative, Hampshire Record Association, in care of

GOVERNMENT CONTROL OF PACKERS URGED.

The United States will never have a satisfactory and permanent solution of the meat problem until the manufacture, sale and distribution of meat products are officially supervised by authorized agents of the Government, working in co-operation with State and municipal authorities, whose only aim is to serve the public at large and not any particular class. This is the opinion of senators and representatives from livestock producing regions, as summarized by the Department of Agriculture.

The Department goes on to say that when the Federal Government is enabled by law to maintain a just supervision over the meat-producing industry that will prevent unfair dealings, speculation and profiteering, by furnishing the public all the facts regarding the industry, and when the states and municipalities are enabled by law to exercise similar supervision over interstate and local business, then, and only then, can we expect to have fair and stable markets in which producer and consumer alike will have a square deal.

There is no longer need for meat conservation. The supply is plentiful and patriotic citizens may disregard the war-time requests. Europe needs our surplus pork, but is filling her beef requirements from South America and Australia. Prices of beef cattle have fallen sharply since March 1 on account of the stoppage of exports for army use and a slack demand at home. Beef and lamb producers who sell their products now are confronted with the danger of heavy financial loss, which will tend to restrict production and cause a serious shortage in the future, unless some steps are taken to change conditions. The excessive retail prices now existing are not justified by wholesale quotations. They are so high that consumers are denying themselves, yet the prices paid producers for beef are too low.

Poultry and Rabbits for Profit

Conducted by R. H. Whitten.

LAY-MENT OF THE HEN.

(Tune: The Rosary.)

The eggs I've laid for thee, dear sir,
Would make a host of chicks for me.
I count them over every one that fills
Thy hatchery, thy hatchery.
Each day an egg, each egg a chick,
To soothe a starving mother's heart.
With hope I climb into the nest
And there a trap is hung.
Oh, families of which I've dreamed!
Your cruel gain, my bitter loss!
I kiss each egg good-bye and strive
to learn
To lay for man, ah, me!
To lay for man.

DOLLAR NEGLECT MEANS TEN DOLLAR LOSS.

(By T. E. Quisenberry, Pres. American Poultry School.)

The poultry and egg business has come into its own. The prices which have been paid for the products have been reasonably satisfactory. You can look for even higher prices this winter than in any previous year. The export demand is going to be greater, and while this has been a splendid year for farmers and poultry raisers, I look for 1920 to be still better.

It behooves every breeder to pay close attention to those little details which make for his success. The season for the little fluffy, downy, interesting baby chicks is past, and we are too apt to lose interest and grow lax with our methods and work.

One of the most important things to avoid during the summer months is crowding. Don't crowd the chicks in the house or yards. If your house is crowded at night, the larger ones will impose upon the weaker, mites and diseases are apt to get a start, and the vitality of your chicks will be sapped. Get the chicks to roosting on temporary roosts as soon as possible.

If you are not eternally on the lookout, mites are certain to get started in the cracks and crevices of the nest boxes and roosting quarters. Every roost and nest should be painted every two weeks with a liquid mite killer or a mixture of two parts of crude oil with one part of crude carbolic acid. Go into every crack and crevice with the mixture. Keep the droppings, broken eggs, dirt and filth of every kind cleaned up. If once started, mites breed by the millions and cost you in feed, health and the vitality of your flock.

Cultivate your yards and the ground around the poultry houses. Cover it with air-slaked lime before turning the soil. Sow some rape, swiss chard, barley, or something else which will make tender green feed. Keep the chickens off of it until it gets a start. If you can't do anything more, spade up a few shovels of earth in each yard each day and encourage the chicks to work in that.

Lice also thrive during the summer. Examine chicks and grown fowls for evidences of them. If your chicks appear dumpish, one of the first things to do is to examine your house for lice and your chicks for mites. Some of the advertised lice ointments are good for mature fowls. Three-fourths of a pound of lard, one-fourth of a pound of suet, mixed with one-half pound of blue ointment, makes a good ointment. Mix this thoroughly and use an amount equal to a garden pea just about an inch below the vent and the same amount in the fluffy feathers on each thigh. See that this is rubbed into the skin at these points. Do not use this for young chicks. For head lice on baby chicks, use a drop of sweet oil on the head and one drop under each wing.

Drinking water must be supplied frequently on hot summer days and the pan should be kept in the shade. The egg and the body of the fowl are composed largely of water. If you let the pan go dry you cut down growth and egg yield just that much. There is nothing so cheap if supplied, yet so costly if neglected, as water. It

makes your feed go nearly twice as far, and don't forget that the fowls drink a great deal on these hot days. You must also remember that scum and germs accumulate on the drinking pan, so these should be cleansed each day and disinfected once a week at least.

Dead poultry, rats which have been killed, or meat of any sort, should not be allowed to lie about the premises and become tainted. These should be promptly removed, and burned or buried deep. Limberneck is apt to result from ptomaine poisoning after such meat is once tainted or starts to decay.

A moist mash will whet the appetites of the youngsters and hasten growth. They relish a feed once a day of the moist mash, but it should not be fed sloppy. Neither should it be fed too freely, and allowed to remain in the feeding trough to become sour.

Don't expect to feed a single grain like corn, barley, oats, or kaffir corn to your poultry and get best results. They cannot thrive and do best on a

single food. They require variety and some ground food.

WHEN CHICKENS GET CHOLERA.

Fowl cholera demands fire-department speed in combating it. Drug treatment or home remedies only waste the time of the poultryman and allow the malady to spread. Strict sanitary measures must be applied at once to control this infectious disease, which spreads rapidly through the flock with high mortality. Turkeys, ducks, geese, pigeons and chickens are all susceptible to it.

Cholera is transmitted from flock to flock by means of sick or recently recovered fowls which have been placed in the flock without being subjected to a period of quarantine. The disease is also spread by wild birds or by persons, animals or utensils which have been on infected premises. A yellowish coloration of the droppings is an early indication of the disease. Soon diarrhoea develops, considerable fever is shown, and the bird loses its lively appearance, separates itself from the rest of the flock and appears dull, dejected and sleepy. It no longer searches for food, but sits with head drawn down to the body or drawn backward and resting in the feathers about the wing. The plumage soon loses its brilliancy, the wings

droop, the appetite is diminished, and the thirst increased. The comb and wattles may be a dark bluish red from engorgement with poorly oxygenated blood, or they may be pale and bloodless on account of the congestion of the internal organs, especially the liver.

Symptoms of Stricken Birds.

The affected birds soon become very weak, drowsy, and often sleep so soundly during the last day or two of their lives that it is difficult to arouse them. If obliged to move they stagger forward for a few steps in an uncertain manner and with dragging wings. The crop is generally dis-

for the Irrigationist

CHECKING the flow of water in laterals or streams and backing it up to any desired distance is a problem the irrigationist meets continually. The Calco Adjustable Metal Irrigation Dam is a simple, effective device that solves this irrigation problem. It holds water, backs it up as desired and—protects the lateral from injury.

The Lyman Irrigation Meter measures, accurately, all water passing over a weir, regardless of the changing level of the supply canal. These two necessities for irrigationists save time, labor and money for him.

Lyman Irrigation Meter

It does away with the guess work of the old method of one or two measurements a day. With it on your weir, you pay only for the water you actually use. It's easily attached by anyone in a few minutes. Weeds or silt in the water do not affect its operation and it needs no attention after its installation. Write for folder.

Put these devices to work on your system. Send your check or money order today for a Calco Metal Irrigation Dam. Ask for the Lyman Meter folder with measurement tables.

Write now.

tended with food and apparently paralyzed. The weight and strength of the bird rapidly diminishes, it breathes with difficulty, sits with beak open, and the breathing may be heard at some distance.

Finally the weakness is such that the bird is rested on the ground and a little later the bird dies. In very acute cases no symptoms are seen; the birds may be found dead under the roosts or they may fall at the feeding trough and die in a few minutes. Cholera may destroy the greater part of a flock in a week and then disappear, or may linger for months, only occasionally killing a bird. The time between exposure to the contagion and appearance of symptoms is from two to five days, while the duration of the disease is from 24 hours to 10 days. Most characteristic changes seen after death are red spots on the surface of the heart, which give it the appearance of having been sprinkled with blood, congestion of the intestines, enlargement of the liver, and swelling of the spleen.

Stopping Infection's Spread.

Since treatment of the affected birds is almost futile, the aim should be to prevent so far as possible the spread of infection. The first fowls showing acute feverish symptoms should be destroyed by a method guarding against contamination of the premises by infected blood. The carcasses should be burned or deeply buried. The healthy fowls should be moved to new quarters, if possible, and carefully watched for signs of disease. Houses and runs should be thoroughly cleaned frequently and disinfected with a 5 per cent solution of carbolic acid, a 2 per cent solution of compound cresol, or a reliable coal tar disinfectant in proper dilution. The drinking water may be made antiseptic by adding one dram of permanganate of potash to each gallon. This serves to prevent the spread of disease through the water and also is a convenient means of administering an internal antiseptic. Prevention and treatment to control fowl cholera by means of anti-seum and vaccine have not proved sufficiently satisfactory to warrant recommendation of the use of such preparations.

GIVING MEDICINE TO RABBITS.

Ever try to administer medicine to a rabbit? It isn't as easy as it sounds. Often the little critter will refuse to open his mouth, and if simple forcing is tried the strongest man will find himself up against a hard task.

Let the rabbit sit in a natural position on all four feet, and with the thumb and finger of the left hand press the lower lip firmly back against the teeth. Have the spoon in the right hand, and slip it slowly into the rabbit's mouth as you press the lip back. Tilt the head back gently, and hold it long enough for the medicine to be swallowed. A little practice will enable you to do the trick quickly and without injury to the rabbit.

Sunflowers are easily raised in almost any soil. They provide shade for fowls, and their seeds make excellent poultry food. Mammoth varieties of this plant can be grown and very little time and attention is required for cultivation. When seeds ripen and begin to drop, cut off the heads and hang in a dry place to preserve for future use.

A chalky white earlobe indicates a bird is laying heavily, whereas a cream-colored one shows the bird is laying moderately, has just started, or has just stopped. A milk colored earlobe shows slight laying, and a very yellow or dark earlobe means no eggs have been laid at all.

A small flock well taken care of is more profitable than a large flock handled carelessly. Poultry must be given the proper attention every day. Profits lie in good stock and proper care.

A scrappy disposition in a male bird can be taken as an evidence of vigor that will be transmitted to his offspring.

SAVAGE

Chicken Insurance —

A .22 Savage Hi-Power

A FLURRY of feathers, a squawk and a red streak going under the fence — another chicken gone!

How long are you going to stand it?

You know that coyote won't look at your traps. And when you sling lead at him with your old slow-assmolasses .30-30, he knows you're guessing you don't know how much to hold over him to allow for the drop of the bullet or how much to hold ahead of him to allow for his speed. And he knows you're half afraid to shoot anyway — the old .30-30 bullet might glance and hit a cow or a neighbor.

You need Chicken Insurance — the .22 Savage Hi-Power — the special tool for the job.

The .22 Savage Hi-Power rifle snaps its wicked little 20 grain spitzer point bullet out 2800 feet — more than half a mile a second.

You don't have to guess how much to

hold over — you don't have to guess how much to hold ahead — you simply hold dead on. And at the crack of the gun the vicious little bullet bites in right where you are holding.

It hits a paralyzing, explosive, knock-out punch — hits hard enough to drop grizzly and moose dead in their tracks — yes, and tiger and buffalo, too, because it's done it.

But it is safe to use anywhere, because the bullet will not glance. You can't make it glance, not even from water.

These are some of the reasons why so many United States Forest Rangers and Government hunters and professional wolfers use the .22 Savage Hi-Power. It's the modern, special tool for predatory animals — and, besides that, Captain E. C. Crossman, the United States Army Ordnance Department Expert, called it "The Best Deer Rifle in the World."

Write us for particulars and look at the rifle at your dealer's

SAVAGE ARMS CORPORATION

.22 Savage Hi-Power, featherweight take-down model, 20 inch specially tapered round barrel. Adaptable for deer, black bear, wolves, coyotes, foxes, etc., at long and unknown ranges.

Whitewashing the interior of the hen-house thoroughly once or twice a year will help to keep it sweet and clean.

A reader asks us why it is advisable to paint the inside of a chicken coop. This is to keep hens from picking the grain out of the wood.

Poultry Breeders' Directory

WHITE LEGHORNS are the most profitable breed of poultry. If you are in the business for profit, you will eventually have them. Early broilers; early layers; early profits; we sell only White Leghorn Baby Chix from heavy-laying Hoganized hens. Safe delivery of full count live chix guaranteed. Prices per 100: February \$15; March \$14; April, \$12.50. The Pioneer Hatchery, 408 Sixth St., Petaluma, California.

DON'T BE TOO LATE BOOKING fall chicks, reduced. Get ready for high-priced broiler, roaster holiday trade. Seven varieties clearing customers \$5.00 yearly. 200-290 egg strain. Chicks every week in year. 70,000 capacity hatcheries supplying chicks. All booked some weeks. **HUNDREDS LAYING PULLETS**, breeding hens, roosters, reduced July, August. Valuable circular with proof free. J. Beeson, Pasadena, Calif.

THE MISSION HATCHERY

August and September Baby Chicks — White and Brown Leghorns, R. I. Reds, White and Barred Rocks. Reasonable prices. Quality stock. Supply limited. Book early. Box 17, Campbell, Cal.

PEERLES WHITE WYANDOTTES — Our 200-egg strain, bred for years for show qualities and high egg production. 50 cockerels, 100 pullets for sale. Trios and mated yards. Eggs for hatching. Catalogue free. J. W. Atkinson, Box 8, 130 Willard St., San Jose, California.

GET BABY CHICKS NOW — Write for free booklet on fall chicks. See why they pay. Several varieties every week. Only good, strong youngsters shipped. Stubbs Poultry Ranch and Hatchery, Box 67, Palo Alto.

SURPLUS STOCK SALE — account of moving. Hoganized White Orpingtons and Sicilian Buttercups; trios, pens and singles, at reasonable prices; write for list. M. S. Woodhams, San Mateo, Cal.

EGG BRED — Buff Brown, White Leghorns, Golden Campines, Dark Cornish. Winners wherever shown. Send for circular. Percy Ward, 3142 Ward St., Fruitvale, California.

S. C. WHITE LEGHORN CHICKS — by the 100 or 1000 from A-1 Hoganized and Trapped stock. Won 1st, 2nd, and Special (Utility Class), Oakland and Modesto. Order early for Fall and Spring delivery. A. O. & P. M. Forster, 2918 Otis St., Berkeley, Cal.

BARRED PLYMOUTH ROCKS — Nothing better in poultry. Prize-winners and wonderful layers. Choice stock for sale. Chas. H. Vadden, Box 3, Los Gatos, Calif.

BABY CHICKS — We have the large heavy-laying S. C. White Leghorns, severely culled last year. Send for prices. Tupman Poultry Farm, Ceres, California.

EASTMAN'S BRED TO LAY Hoganized and trapped Barred Plymouth Rocks. September chicks. Fairmead Poultry Farm, Fairmead, Calif.

FOR SALE — 72 purebred S. C. Rhode Island Red pullets. April hatch; Eastern stock. Two dollars each. Mrs. Alice Jeter, Esparto, Cal.

GOLDCROFT BUFF ORPINGTONS — Winners San Jose show. Choice stock for sale. Samuel Abrams, Los Altos, Calif.

CHICKENS, DUCKS, GEESE, GUINEAS. Pea Fowl, Pigeons. Wm. A. French, 545 W. Park St., Stockton, California, Stamps.

RABBITS.

RAISE RABBITS — Most profitable and popular small animal in America. Big demand. Clean, fascinating work. Send 10c for copy of leading rabbit magazine and our Rabbit Books, P. N. 5. Gilmore's Rabbit Farm, Santa Barbara, Calif.

NEW ZEALAND REDS — First class utility does bred \$5.00 each. Young does, \$2.50 each. F. R. Caldwell, Broadmoor, San Leandro.

RAISE RABBITS FOR US — We supply the breeding stock. Send stamp for particulars. H. E. Gibson Co., Arcadia, Calif.

THE HOME CIRCLE

TROUBLE BORROWED.

The heart too often hath quailed with dread,
And quite its courage lost,
By casting its glance too far ahead
For the bridge that never was crossed.

The toughest fight, the bitterest dregs,
The stormiest sea that tossed,
Was the passage-at-arms—no, the
passage-at-legs,
Of the bridge that never was
crossed.

A wind that withers wherever it goes,
And biting as winter frost,
Is the icy blast that constantly
blows
From the bridge that never was
crossed.

What folly for mortals to travel that
way,
As many have found to their cost—
To tempt the terrors by night or by
day
Of the bridge that never was
crossed.

The adage is old and worn a bit,
But worthy of being embossed—
Never cross a bridge till you come to
it—
The bridge that must be crossed.
—Dr. S. B. Dunn.

A COOL KITCHEN FOR SUMMER.

Last week we sang of the joys of a fireless cooker, and the burden of our song this week is the coal oil (or gasoline) stove in lieu of the hot wood or coal range for summer use. Indeed, we cannot give too much thought and attention to the family's comfort as the dog days approach.

The summer appetite, as a rule, is not so ravenous as in the cooler weather, and for this reason it is not necessary to cook big heavy meals which require long boiling or baking, which process might be more practically performed on the range. This, then, is when the coal oil (or gasoline) stove is of such practical use. Anything, however, can be cooked on them for which a range is used, but the coal-oil stove is particularly convenient for starting the hot dish for the summer day's dinner; this will require about fifteen minutes; and then the food can be placed in the fireless cooker until ready to serve; or, if one does not possess both a fireless cooker and an oil stove, the entire meal can be cooked on the oil stove without the discomfort experienced over a hot range. This is most advantageous during the summer months when strength, energy and comfort are to be conserved.

The coal oil stove is as safe to use as is the ordinary coal oil lamp, and requires only about the same attention, viz.: to see that its tank is kept filled, and the stove clean at all times. The initial expense is not great, considering the increased efficiency and greater comfort experienced in the kitchen.

The operation of a farm requires greater and greater efficiency, which is possible only with time and labor-saving devices. Men are seeing the wisdom of providing tractors, milking machines, electricity and other such modern equipment to facilitate farm work, and the housewife and the home have every reason to keep abreast of the progressive methods now employed by all up-to-date ranch and farm owners. Indeed, the home work, with its many petty details of daily routine, furnishes a more practical opportunity for the use of modern equipment than does the outdoor work on the farm; housework is a daily repetition year in and year out, while the outdoor farm work varies with each succeeding crop, requiring various and sundry equipment for its handling, and hence more expense. But cooking meals (and eating them) is not only a daily routine, but is a triple performance for each day; then the one whose duty it is to look after the meals should have just the right sort of stove and other proper equip-

ment to facilitate the preparation of the food that sustains, and the cup that cheers.—Z. D. H.

CANNING SIMPLE, EASY, BY USE OF GOOD METHODS.

Anyone who follows directions and uses care and cleanliness should be able to can food successfully. Home canning may be done in the kitchen, out of doors or in a community kitchen. Women, boys, girls and men last year "put up" millions of jars of fruits and vegetables, with a trifling percentage of loss, by the methods of home canning used by the Department of Agriculture in its home-demonstration and boys' and girls' club work.

These methods are simple and give good results when carefully followed. In brief, the fruits and vegetables—washed, pared, scraped and cut up as may be required—are blanched in boiling water or steam, then dipped quickly into cold water and packed immediately into hot jars. The contents are covered with boiling salted water or sirup, as may be required. The jars, partially sealed, are placed in a large container with sufficient water in it to process them, or, if preferred, in a steam pressure canner. When the jars have been steamed or boiled, according to directions, the requisite time for processing, they are removed, sealed tight, tested for leaks, and stored.

Especially for a few vegetables, such as corn, beans, peas and asparagus, many prefer to use fractional processing—that is, the jars are boiled for 60 to 90 minutes on three successive days. Processing is more quickly accomplished, however, with a steam pressure canner than by the water bath method. Only one period of "processing" is necessary for even those products which are difficult to keep if steam pressure is used. Consult your home demonstration agent and follow the procedure she recommends.

The method used by the Department of Agriculture in its extension work insures good color, texture and flavor to the vegetable or fruit canned. An ordinary kitchen usually possesses all necessary equipment for hot water bath canning. A large metal vessel, such as a wash boiler, with tight-sealing jars, good rubbers, a yard of cheesecloth, and the usual pans and bowls, are the articles required.

Any type of jar which seals readily may be used. The essential requirement is that it shall be air-tight. These directions are for canning in glass. If tin containers are preferred, write the U. S. Department of Agriculture for directions for canning in tin.

If a jar with the one-piece Mason top is used test it. Pour warm water into the jar, add the ring, and screw on the top. Invert, and if there is leakage, remove the top and with the back of a heavy knife or some other smooth hard surface, straighten the crimped spot on some hard surface. Test for leakage again. If an air-tight seal cannot be made, discard the top.

New rubbers are necessary every year, and should be tested. A rubber ring, to stand sterilization with the jar and its contents, must possess life and elasticity. It should return to its original length after being stretched to $2\frac{1}{2}$ times its length. A good rubber ring should also be able to support a weight of 13 pounds without breaking.

It is very important in canning to work quickly. Once started, there should be no intermission between the steps. Have all utensils in readiness. Wash and test jars, tops and rings. Sterilize jars and tops in boiling hot water for 15 minutes, and then leave them in the water, ready for use. Place the rings, ready for use in a hot solution of cooking soda and water made in the proportion of 1 teaspoon of soda to 1 quart of water, ready for use. If a washboiler or lard can is to be used for processing the jars, have a false bottom of wood

DREADNAUGHT
BLAZING AWAY IN COST-DEFENCE!

FUEL DIVIDENDS

It's saving no matter how you figure it, in the making of clean oil-gas from kerosene with a Dreadnaught Burner—You clip the interest coupons both going and coming. In actual hard cash—say nothing of labor—you get just about twenty-five cents in value out of every dollar's worth of wood burned. The seventy-five cents?—Gone up the chimney, or in the ash pan—unconsumed fuel in both cases. You're burning good money and throwing in a lot of hard work for big measure.

Experiments are over with: Oil is the greatest fuel the world has ever known—it's 100 per cent in value.

Run a pipe into your stove, screw a Dreadnaught Burner on and you will never want to part with it. It's all so simple that it is hard to describe convincingly in limited space—just write for our factory circular, it will be sent promptly and we will also gladly answer all questions asked.

in place, and before commencing to prepare the fruit, put in the boiler, with sufficient water to cover the jars; or, if a vessel with tight-fitting cover is used for processing, water to the shoulders of the jars is sufficient. Start the water heating at once, as it takes a large volume of water some time to become as hot as it should be when the filled cans are placed in it. Have the sirup for fruit, or hot salted water for vegetables, ready before commencing the actual work.

When the jars are filled and partially sealed, place them in the boiler of warm water. Be sure the water is boiling vigorously before starting to count the time of processing that particular product require. If a steam pressure cooker is used, live steam should be escaping from the petcock before starting to count time. It is convenient to have a reliable alarm clock in the kitchen at canning time. Set it to ring when the sterilizing is finished.

When the jars are processed, remove and at once tighten the tops. Do not let filled jars cool before doing this. The hotter the product when the clamps or covers are tightened, to furnish sufficient pressure on the lid to effect a seal as the jar cools, the better.

Remember, the essentials in canning fruit and vegetables are these: Fresh products, pure water, care, cleanliness, good jars, "live," standard rubber rings and sufficient heat to process the products thoroughly in the closed container.

Canning and preserving on an ordinary stove is very trying work in

Water is the cheapest beverage, tea next.

"Why, how can that be?
A pound of tea costs—"

Excuse us for interrupting you, but the way to count the cost of tea is not by the pound, but by the cup. A cup of fine strengthening invigorating delicious tea costs only $\frac{1}{3}$ cent per cup, because a pound makes so many cups.

Schilling Tea is the fine practical economical tea of this country.

There are four flavors of Schilling Tea—Japan, Ceylon-India, Oolong, English Breakfast. All one quality. In parchment-lined moisture-proof pack—ges. At grocers everywhere.

A Schilling & Co San Francisco

the summer time. A gasoline fire pot, such as plumbers use, is ideal for this work. It can be placed out of doors if preferred to working inside. It requires less than a quart of gasoline per hour to run the pot; it

will be found to be one of the most useful labor and time savers on the farm where a quick heat is desired.

HELPS FOR WASHDAY.

While among enlightened people there is no way of entirely avoiding the weekly turmoil of the washtub and ironing board, there are ways, and easy ones too, of mitigating its terrors.

In the first place, a careful study should be made to reduce the size of the washing without interfering with family comfort or lowering the high standard of cleanliness which makes home delightful. A woman who set her mind upon this problem last year when her family moved from a city house to the country found that she lessened the articles to be washed fully one-third. She put all the white counterpanes they had used in the city in the bottom of a trunk and covered the beds with gaily flowered spreads made of cretonne. They looked very pretty and fresh, and were used all summer without needing laundering. During the summer she substituted a center-piece and doilies for the tablecloth, so there was no washing and ironing of those large pieces on the hot summer days, and the table with its lace-edged doilies, so easy to launder, looked exceedingly cool and dainty. Besides, if Miss Baby dropped jelly at her place, or impetuous Brother spilled the gravy, it was not necessary to remove a long cloth.

She began the custom of having the sheets and bath towels folded for the cupboards as they were taken from the line.

Hand towels, pillow slips, and napkins were quickly put through the inexpensive mangle she purchased, and some of the children's coarser handkerchiefs were treated in the same way.

The nightgowns and underwear for all the feminine members of the family were made of the popular white seersucker which requires no ironing, and trimmed with a heavy lace that shook out in the breezes and needed no pressing. Blue and light brown seersucker shirts and blouses clothed the boys on week days, and one starched shirt each for Sundays was the sum of the ironing in that line. The little girls wore colored seersucker frocks, and even their best dresses were made of the soft white crepe which, like their mother's blouses and gowns of the same pretty and becoming material, were ready to wear when taken from the clothes-line.

"I think," said this little mother as she expounded her system, "that the doing away with so much handling of the clothes, the sprinkling and folding as well as the ironing, has done more than any other household reform could have done to iron away what my husband used to call the 'washday creases' in my forehead."—
Kilbourne Cowles.

HOUSEHOLD HINTS.

To remove scorch from fruits, vegetables or meats, drop in a small piece of charcoal, and the scorched taste entirely disappears.

Paste strips of velvet around the inside of the heels of the children's shoes and you will have fewer holes to darn in their stockings.

Oilcloth on kitchen table or cabinets can be made to last longer if a padding of soft paper is placed under it. The life of oilcloth can almost be doubled when this is done.

Custards and all baked puddings bake quicker when put in a pan with an opening in the center such as angel cakes are baked in. This sort of a pan allows the heat to reach a greater part of the contents and thus the baking is accomplished quicker.

"Housewife" sends in a timely recipe for making apricot marmalade out of small fruit. She writes, "Some were not ripe enough to have juice, so I put all through the grinder, medium-sized knife. It was smooth and juicy to begin cooking. After cooking tender, use three-fourths as much sugar as fruit. One part grated pineapple to twelve of apricot makes a fine flavor. This is a quick and easy way."

MARKET COMMENT.

Hay marketing after July 22 will be under provisions of the new law which was printed in full in our issue of June 28.

The unirrigated prune orchards around Chico are still dropping fruit (July 12). The peach crop, however, promises to be the heaviest yield in years.

The weather has turned warm and melons are ripening fast, according to the T. M. and G. Co. They now estimate that there will be about a 40 per cent reduction in the acreage on account of root disease and climatic conditions, together with a shortage of water. Many vines which were considered excellent a few weeks ago are now in a dying condition. There seems to be plenty of labor so far but the housing problem to accommodate it is lacking. The large amount of extra help coming into town has made this condition acute. F. W. Hosmer, general manager of the T. M. and G. Co., estimates they will ship 1500 cars with every promise of fine quality and good prices.

\$16,000.00—80 acres in Honey Lake Valley, Lassen county. All under cultivation. Alfalfa seed, hay, and grain; under good irrigation system. Good improvements. 2 miles from postoffice and bank. School, 1 1/2 miles; high school, 15 miles; S. P. depot, 3 miles. Daily trains. A good buy. Cash only. Have other business prospects. Write to Box 280, Standish, Lassen Co., Cal.

FOR SALE BY OWNER—18 acres improved, about 5 miles south of Williams, 11 miles southwest of Colusa, county seat of Colusa Co. near State Highway. Alfalfa. Abundance of water for irrigation. Ideal poultry and dairy ranch. Address C. A. Hanson, Williams, Cal.

GRAIN AND FRUIT RANCH in Lake county for sale—31 acres; 1548 fruit trees, mostly Bartlett pears; rest in grain; 6-room house. Fruit crop goes with the ranch if sold soon. Price \$9,000. Mack Mathews, Lakeport, Cal.

FOR SALE—My Equity of \$9700 in 40 acres alfalfa land. 5 miles from Manteca. Address Wm. Robertson, 860 Fulton St., San Francisco.

WANTED TO EXCHANGE—Improved ranch in Tulare county for stock ranch in northern California. Address 154 So. C St., Tulare, Cal.

THE MARKET REPORTS

Figures Given Are Independent and Reliable.
Prices Quoted as Paid to Producers.

SAN FRANCISCO.

San Francisco, July 16, 1919.

WHEAT.

There is no change here, but the firm tone of the eastern markets tends to keep the market here from being really weak.

Per bushel—	
No. 1 hard	\$2.20
No. 2	2.17
No. 3	2.13
No. 1 soft	2.18
No. 2	2.15
No. 3	2.11
Club or Sonora, No. 1	2.16
do, No. 2	2.13
do, No. 3	2.09
Recleaned, per cbl.—	
California	\$3.87 1/2 @ 3.75
Early Baart	\$4.15 @ 4.20

BARLEY.

Barley is very firm and the price has been marked up an average of five cents all around. The local demand continues slow, the strength of the market being entirely due to the shipping demand.

Feed	\$3.07 1/2 @ 3.10
Shipping	\$3.15 @ 3.20

OATS.

New oats are now reaching the market, but in such limited demand as to have little effect on prices, which continue about as before. Good old oats are well cleaned up, only off-grade stock being in any considerable supply.

Red feed, per cbl	\$2.70 @ 2.75
Red for seed	Nominal
Black for seed	Nominal
Recleaned Red or Black for seed	Nominal

CORN.

The corn market as a whole has been neglected this week. Nothing is offered, and there has been very little demand.

California	\$3.30 @ 3.50
Egyptian, choice	Nominal
Milo	Nominal

HAY.

Receipts of hay are increasing rapidly as is usual at this season, but the increase in supplies has been well cared for so far and prices have shown no change. Alfalfa has been the best seller, and is still moving very freely. Trade with the interior is very good, in fact, sufficient to about make up for the big drop in the government demands as compared with this time last year. Number 1 oat and wheat have now begun to come in in considerable quantity, and orders for these are being filled promptly.

No. 1 Wheat, per ton	\$15.00 @ 17.00
No. 2 Wheat, per ton	12.00 @ 14.00
Choice Tame Oat, per ton	15.00 @ 17.00
Wild Oat, per ton	10.00 @ 12.00
Barley Hay, per ton	\$11.00 @ 13.00
Alfalfa, per ton	14.00 @ 16.00
do, new, 1st cutting	
Stock Hay, per ton	9.00 @ 11.00
Barley Straw, per bale	.50 @ .80

FEEDSTUFFS.

The important thing in feedstuffs is the quoting of "millrun" and "millmix" as substitutes for bran middlings, straight bran and middlings being now entirely off the market. Millrun is arriving in hundred-pound sacks and is selling at \$43 to \$44 per ton, while millmix comes in eighty-pound sacks and

sells at \$57 to \$60 per ton. Millstuffs are firm throughout.

Bran	Not being marketed
Shorts	Not being marketed
Cracked corn	72.00 @ 73.00
Rolled barley	62.00 @ 63.00
Rolled oats	56.00 @ 58.00
Alfalfa meal	33.00 @ 35.00
Cocunut meal	48.00
Oil cake meal	71.00 @ 72.00
Millmix	57.00 @ 60.00
Millrun	43.00 @ 44.00

POTATOES, ONIONS, ETC.

Old stock potatoes are getting well cleaned up. Idahos are off the market, and only a limited supply of Oregon and River potatoes remain. New potatoes are in more plentiful supply, but the price does not show much change from last week's figures. On onions the market is a little easier. Southern tomatoes have been replaced by shipments from the Sacramento River section, these bringing \$3 to \$3.50 per box (large boxes). Merced tomatoes are more plentiful also. Peas and string beans have both receded a little and Alameda green corn has shown quite a drop as the result of increased supply.

String beans	5 @ 6c
do, Garden	7c
Peas	5 @ 7c
Carrots, per sack	\$1.50 @ 1.75
Rhubarb, Strawberry, box	\$1.50 @ 2.00
Cucumbers, hothouse, box of 30	\$1.25 @ 1.50
do, Los Angeles	50 @ 75c
do, Bay	\$1.00 @ 1.25
Eggplant, box	\$1.50 @ 1.75
Lettuce, per crate	75c @ \$1.25

Summer squash	50 @ 60c
do, Alameda	\$1.00 @ 1.25
Green Corn, Alameda, sack	\$3.50 @ 4.00

Potatoes—	
Oregon	2.25 @ 2.50
Idaho	\$2.10 @ 2.35
Garnets, new on street	\$2.50 @ 3.00
Other new on street	\$2.25 @ 2.60
Sweets, new, lb.	6 @ 7c
Onions, Warehouse Stock—	
Australian Browns	Nominal
Onions, new red	\$3.50 @ 4.00
Yellow	\$3.50 @ 3.85
Green Alameda	\$1.50 @ 1.75
Garlic	15 @ 18c

BEANS.

Except for a moderate advance in the price of blackeyes, last week's bean quotations remain unchanged. This advance reflected increased demand. A little better call was noted for large whites also, but not enough to cause a further advance, the price on these beans having been marked up slightly a week ago.

Bayos, per cbl.	\$5.90 @ 6.10
Blackeyes	\$4.42 @ 4.75
Cranberry beans	5.75 @ 6.00
Limas (south, recleaned)	\$9.00
Pinks	\$5.50 @ 5.75
Mexican Beans	4.50 @ 5.00
Tepary beans	2.50 @ 2.75
Garbanzo	11.75 @ 12.00
Large whites	5.85 @ 6.00
Small whites	6.75 @ 6.90

POULTRY.

The poultry market recovered strength during the past week. Receipts were heavier

than the week before and the demand sufficient to take care of the arrivals quite nicely. The market on broilers is firm at prices quoted with some prospect of another advance in price on good healthy stock weighing under 1 1/2 pounds. Hens have shown a big advance during the week, some Leghorn hens selling up to 32 cents, large colored at 34 cents.

Turkeys, live, young spring, lb.	Nominal
Broilers, 1 1/2 lbs. and under	33 @ 34c
do, 1 1/2 to 2 lbs.	32 @ 34c
Fryers, 2 to 3 lbs.	34 to 36c
Hens, extra, per lb., colored	32 @ 34c
do, Leghorn	38 @ 40c
Smooth young roosters, per lb. (3 lbs. an over)	40 to 44c
Old roosters, colored per lb.	22 @ 23c
Geese, young, per lb.	22 @ 23c
do, old, per lb.	22 @ 23c

Ducks, young	25 @ 28c
do, old, per lb.	25 @ 28c
Belgian hares	14 @ 16c
Jack rabbits	\$3.00 @ 3.50

BUTTER.

Butter receipts were ten per cent less in volume for the week ending today than for the preceding week with the market showing a variation of one-half to a cent per pound from the opening figure for the week. Shipping to outside points included San Diego and some exporting, the local demand and cold storage warehouse taking care of the surplus.

Extras	52 1/2	53	52 1/2	52 1/2	52 1/2
Prime firsts	51	51 1/2	51 1/2	51 1/2	51 1/2
Firsts	48 1/2	48 1/2	48 1/2	48 1/2	48 1/2

EGGS.

Eggs were in light receipt for the week with the market advancing by easy stages from the opening quotations and registering an advance of one and one-half cents per dozen. Shipments of extras are reported from local and producing points to the East and Los Angeles destinations. Fancy selected stock is still going into storage and withdrawals are also reported.

	Thu	Fri	Sat	Mon	Tu	Wed
Extras	47	47 1/2	47 1/2	47	48 1/2	48 1/2

Ex. pullets	41 1/2	42 1/2	42 1/2	42 1/2	43 1/2	43 1/2

CHEESE.

Cheese receipts were in excess of last week with California fancy flats being scarce in the general volume and the market easily absorbing all offerings. The price advanced under the temporary shortage of this variety, closing steady to firm today.

Fancy California flats, per lb	30c
do, Firsts	28c
California Y. A., fancy	31 1/2c
Oregon Y. A., fancy	33 1/2c
Oregon Triplets	34c
Monterey cheese	22 1/2 @ 34c

FRESH FRUITS.

The fruit market has been active, apricots showing great strength. This is explained by the fact that canners are paying the record price of \$14 a ton for apricots in the local wholesale market. Unable to contract for sufficient supplies from the growers, canners have entered this market this year in large numbers, bidding against one another for all available surplus. In their eagerness to get supplies, they have been taking away a good portion of the normal receipts of fresh apricots.

California apples	\$3.00 @ 4.00
Northwest apples	3.00 @ 4.00
do, New Red Astrakhan, large	75c @ \$1.25

DRIED FRUITS.

The market for dried fruits continues strong, with apples and peaches in special demand. Both these commodities jumped a cent this week. Just what effect the announcement of prices by the Peach and Prune Growers' Associations will have on the market remains to be seen.

The Prune and Apricot Association at San Jose, controlling about 70 per cent of the crop, this week announced prices for the 1919 prunes crop as follows: 20-30s, 22c flat; 30-40s, 16c; 40-50s, 14c; 50-60s, 12c; 60-70s, 11c; 70-80s, 11c; 80-90s, 11c; and 100s, 11c. One cent a pound premium will be paid for fruit delivered before September 20. On small-sized fruit 8 1/2c a pound will be paid for 100-120s and 7 1/2c for 120s and smaller.

Apricots	23 @ 29c
Prunes	13 @ 15c
Figs, Adriatic	14 @ 16c
do, Calimyrna	15 @ 20c

RICE.

There has been greater activity on California rice at the advanced prices noted earlier in the month than when the price enjoyed Government protection, the damaged grades being eagerly sought in the New York and New Orleans markets for export, while the better grades have been sold mostly to the Japanese trade for local consumption. Further advances are predicted on domestic rice.

Special Deciduous Market Report

(Written for Pacific Rural Press by J. L. Nagle.)

Sacramento, July 15, 1919.

General market conditions throughout the past week remained firm, with noticeable activity in bidding and increase in prices, especially in Atlantic Seaboard markets.

Despite increased offerings, prices ruled somewhat higher than the week previous. This is particularly noticeable in peaches and grapes.

What few cars of Bartlett's have reached the East, have met with a very ready demand, at prices higher than ever realized for this variety before. There is an unusually heavy shipment of Bartlett's on the rails and it is estimated that about a third of the Sacramento River crop has already been shipped, but on account of heavy purchases by canners, the total shipments will probably be affected from other districts, so that even with heavier offerings from the Sacramento River, we do not look for the markets, at any time, to break, but anticipate a lower price level on Bartlett's next week. This is to be expected on account of increased sales, but we maintain that a strong market on Bartlett's will prevail throughout the season.

Elberta peaches from the San Joaquin Valley will begin to move within a few days and the demand for canning purposes by Eastern consumers, is unusually heavy. It will not be necessary for any of this variety to reach the Eastern auctions, as the entire crop can be sold to good advantage in West and Middlewest markets.

Though plum shipments are running heavy and will continue so for the next three weeks, the demand will undoubtedly take care of the supplies and the market will unquestionably remain firm.

There seems to be an unprecedented demand for grapes from the Imperial and Coachella Valleys and shipments will continue for the next ten days. By that time Thompsons and a few other

varieties will begin to move from the lower San Joaquin Valley.

The heat of a few days past affected the Tokay crop to a limited extent, the damage not exceeding 25 per cent in some districts, and 10 per cent in others, but despite the injury, the output will be normal, if not affected by any other conditions from now on.

There is considerable interest being shown by foreign buyers for exports of Bartlett's to European and South American markets. No shipments have yet been made as refrigerator equipment is not available at the present time but the export movement should begin in about two weeks. If this is as heavy as at present anticipated, this condition should affect and benefit the Eastern markets.

Our present prospectus would indicate that the general market on all deciduous fruits and grapes will be considerably higher than last season.

Average for the week:
NEW YORK—Bartlett Pears, \$5.18; Wilders H. B., \$2.43; Lawsons H. B., \$3.39; Comets, \$3.06; Malaga Grapes, \$5.56; Thompson Seedless, \$4.63; Triumph Peaches, .71; Royal Apricots, \$1.25; Formosa Plums, \$1.78; Santa Rosa, \$1.88; Climax, \$1.68; Simoni, \$1.41; Burbank, \$1.64; Tragedy, \$1.97; Clyman, \$1.07; Botan, .85; Red June, \$1.15; Abundance, \$1.20.

BOSTON—Bartlett Pears, \$7.00; Comets H. B., \$3.60; Hale Peaches, .86; Triumph, \$1.01; Alexanders, \$1.94; Thompson Seedless, \$3.84; Malagas, \$5.18; Climax Plums, \$1.87; Formosa, \$2.40; Botan, \$2.04; Santa Rosa, \$2.50; Clyman, \$2.13; Burbank, \$2.09; Red June \$2.02.

CHICAGO—Malaga Grapes, \$5.00; Thompson Seedless, \$4.50; Triumph Peaches, \$1.10; Alexanders, .70; Eulatis, .91; Hales, \$1.07; Bartlett Pears, \$5.27; Tragedy Plums, \$2.64; Climax, \$2.20; Santa Rosa, \$2.44; Burbank, \$2.12; Red June, \$2.11; Abundance, \$1.81; Formosa, \$2.40; Shiro, \$1.98; Botan, \$1.72.

HONEY.

There is little feature to the honey market, very little new crop honey having reached this market as yet. Receipts are due in considerable quantity within the next week or two, however. Dealers have paid 18 cents for small lots of sage honey, but this price is considered very high, and not likely to hold.

Straw, per ton9@10.00

ALFALFA GROWERS OF CALIFORNIA, INC.

Los Angeles, Cal., July 15, 1919.

The Alfalfa Growers of California report that the shortage of water in the greater portion of the San Joaquin Valley has seriously effected the third cutting of Alfalfa and indications are that the fourth and fifth cuttings will be light.

In the Alfalfa growing districts south of the Tehachapi most of the fields show a tendency to bloom while the growth is still short.

Recent receipts on the Los Angeles market have been light and the market has advanced on some grades. Indications are for continued light receipts and an active demand.

Present quotations on Alfalfa Hay, f. o. b. cars Los Angeles, are as follows:

No. 1 Dairy\$26.00
Standard Dairy\$24.00@25.00
Standard Alfalfa\$21.00@22.00
Stock Alfalfa\$12.00@16.00

BEANS.

Blackeyes quoted higher since last week. all others, prices remain unchanged and the market dull.

Limas, per cwt.\$8.00
Large white, per cwt.6.25
Pink, per cwt.6.50

Bethlehem

SPARK PLUGS

Proved in the "Tanks"

BETHLEHEM mica tractor plugs were used on the Holt, Chandler and Midwest engines that went into the battle "tanks."

They were used because they could best stand that terrific punishment.

Now Bethlehem tractor plugs, both mica and porcelain, are standard equipment on the country's foremost tractors—in spite of the fact that they cost the manufacturer far more than ordinary spark plugs.

Put Bethlehems in your tractor today. Your dealer has them, and can tell you which model will give the best results in your motor. He can also give you the right Bethlehems for your motor car, motor truck or stationary engine.

Special Livestock Market Report

San Francisco, July 16, 1919.

The bottom of the beef market seems to have been reached and there is a steadiness that presages better price levels. There was a sharp advance in eastern markets last week and shipments to those markets from California have eased up the marketing pressure here which has held prices down the past few weeks. Fifty carloads of cattle were shipped from Porterville to middle western buyers last Monday. Grass cattle will continue coming for a month or six weeks, when hay-fed stock from Nevada will be drawn this way as needed.

Steers—
Grass Steers, No. 1, weighing 950 1100 lbs.10@10 1/2c
Grass Steers, No. 1, weighing 1100 @1300 lbs.9 1/2@10c

do, thin3@3 1/2c
Calves, light weight12 1/2@13c
do, medium11 1/2@12c
do, heavy10@11c

HOGS—Another new record price for live hogs was reached in Chicago last week, due to improved domestic trade, seasonable weather, light receipts, and heavy shipping demands by eastern states and Canada. Foreign conditions, influencing trade, show gradual improvement with the opening up of interior Europe. The California market has responded to eastern high prices and probably will not be appreciably lowered even by the inflow of stubble hogs, which will be coming soon.

Hard, grain-fed, 100 to 15019 1/2c
do, 150 to 20020c
do, 250 to 30019 1/2c
do, 300 to 40019c

SHEEP—Lambs have been a big crop and the demand has kept pace so that consumption has been maintained at the higher prices prevailing. A great many frozen carcasses were shipped east during the spring. Three weeks more will see the California-grown supply low enough to admit Nevada stock.

Lambs, yearling10 @10 1/2c

EASTERN LIVESTOCK.

Chicago, July 14, 1919.

HOGS—Receipts, 51,000; estimated tomorrow, 35,000; steady to 25c lower; mixed and packing grades declining most; top, \$22.95. Bulk, \$21.35@22.90; heavy weight, \$22@22.85; medium-weight, \$21.75@22.95; light weight, \$21.75@22.95; light light, \$20.35@22.60; heavy packing sows, smooth, \$21.25@21.75; packing sows, rough, \$20.50@21.15; pigs, \$19@20.25.

CATTLE—Receipts, 20,000; estimated tomorrow, 18,000; firm.

Beef steers, medium and heavy weight, choice and prime, \$16.40@17.50; medium and good, \$13.75@16.20; common, \$11.35@13.75; light weight, good and choice, \$14.50@17; common and medium, \$10.40@14.50; butcher cattle, heifers, \$8.25@15; cows, \$8@13.25; canners and cutters, \$6.50@8; veal calves, light and handy weight, \$18.25@19.25. Feeder steers, \$9.50@12.50; stocker steers, \$8.25@11.75.

SHEEP—Receipts, 17,000 head; estimated, 15,000; strong.

Lambs, 84 lbs. down, \$15.25@17.75; culls and common, \$9.50@14.75; Yearling wethers, \$10.75@14.25. Ewes—Medium, good and choice, \$7.25@9.50; culls and common, \$3@6.75.

Anderson Combination Dipper Perforator, Grader And Spreader

Send for Catalog
of Packers' and
Dryers' Machinery.

A practical machine that the prune growers of Santa Clara Valley (where it is made) and other prune-growing sections have learned to recognize as the standard machine of its kind. It embodies every possible advantage—and does the work perfectly in every way. Durable and substantial in construction.

MADE IN VARIOUS SIZES

We can furnish this Combination Dipper, Perforator, and Spreader in any size desired—for either hand or power use. Write—and tell us your requirements.

Anderson-Barngrover Manufacturing Co.

20 West Julian Street

SAN JOSE, CAL.

Important To All Tire Users!

MATERIAL COSTS and increased production make possible price reductions that benefit ALL TIRE USERS.

LARGE, STURDY, CLEAN-CUT, and good-looking tires, those that deliver excess mileage are what all Motorists want.

• FISK TIRES have all these qualities.

DEALERS AND USERS recognize their value—ever increasing demand shows satisfaction.

THE PACIFIC RURAL PRESS

SAN FRANCISCO

JULY 26, 1919

LOS ANGELES

California State Lib 71-21

California's Three Showyard Shrines.

Written for Pacific Rural Press by R. H. Whitten.

AT LAST, the final link in the chain of development of California's livestock industry! We have made great strides in the breeding of purebred stock, and it now remains for us to get the quality of our animals before the world. Also, we must impress upon the public the importance of the livestock industry, and show our tremendous possibilities and opportunities, so as to get new breeders started.

Nothing short of great livestock shows will do this. We may talk and print words and pictures galore, but only through showing victories are indisputable proofs submitted, lasting impressions formed and minds influenced. They stand for both education and progress.

State Fair Bigger Than Ever.

Never before has so much interest been manifested in the State Fair; never before have such extensive preparations been made; never before have such heavy entries been received. Secretary Paine says the Big Message will be that the range product is passing and that the farmer of the future must deliver a highly finished product—bred on the

right lines and cared for to the best advantage. The exhibits will show the best ways of accomplishing this and educational features will be played up prominently. Cash prizes, totaling \$45,000, are offered, and the leading herds and flocks of the State will compete for them during the week of August 30 to September 6.

San Francisco Knows How.

Besides the State Fair and an unusually large number of excellent county and district fairs, there will be two big exclusive livestock shows this year—one at San Francisco and one at Los Angeles.

San Francisco never yet pulled off an event without making it about the best of its kind, and the California International Livestock Show, to be held November 1 to 8, will be no exception. The biggest men of the city are back of it, and they promise to make its influence to the Coast what that of the Chicago International is to the East.

The sight of purebred stock at a fair has been the turning point in the career of many a man, and Prof. Gordon H. True, manager, promises to stage such a show at San Francisco that everyone who views the stock and witnesses the demonstrations will see a future full of promise and will want to get into the game. Also there will be educational exhibits of dairy and meat products, intended to connect the consuming public more closely with the breeder, producer, manufacturer and dealer.

Top: California Building at Panama-Pacific Exposition grounds, where the San Francisco Show will be held. Center: New completed Agricultural Pavilion at State Fair grounds, Sacramento. Bottom: Grand stand at Exposition Park, Los Angeles, before which the winners at the Los Angeles Livestock Show will be exhibited.

Los Angeles Will Show 'Em.

The Big Idea of the Los Angeles Livestock Show, to be held October 18 to 26, will be to open the eyes of the entire community, says manager C. R. Thomas. The show will bring from far and near the very best animals of their kinds and will convince breeders who have been asleep at the switch what good blood can do.

Every inducement, including premiums of \$33,000, will be offered to get breeders, general farmers, dealers and others to round up at the show and make a clearing house where they can relate experiences, exchange ideas, buy and sell stock, and boost the industry in general, as well as having a royal good time.

If you want premium lists or further information about any of these shows, write to Chas. W. Paine, secretary of the State Fair, Sacramento; C. R. Thomas, manager Los Angeles Livestock Show, Chamber of Commerce Bldg., Los Angeles; or Prof. Gordon H. True, manager California International Livestock Show, Lachman Bldg., San Francisco. All together now—boost for these shows!

EDITORIAL.

THE VICTORIES OF PEACE.

Peace hath her victories
No less renowned than war.
—Milton.

We are not writing of the league of nations—for that will get nowhere unless President Wilson can explain to the American people how it can be safe and salutary. We write not of Japan's shot at the Nipponification of Shantung—for Americans have not yet agreed to her claim that she did not know it was loaded. Nor do we find anything else in world-peace, as other people are now quarreling over it, which offers us any comfortable comment. The old historical conclusion that war makes peace and peace makes more war, still seems to hold true. We cannot earn the subscribers' dollar by joyful comment on world affairs, for there does not seem to be a dollar's worth of joy in the whole maze of them. Still there is no excuse for yielding hope and courage, for we are still bound for a better world. And no ancient definition of courage and faith in human destiny is broader and better than the very modern one: "We do not know where we are going, but we are on the way!"

Incidental and fundamental thereto is the evidence of local industrial activity and prosperity. As socially and industrially a busy, prosperous and contented family is the foundation of national strength and success, so, geographically, the industrial activity, development and prosperity of a commonwealth are the clustering congeries of units of courage and contentment, which determine the future of a country or of a continent. We are justified then in commenting upon current topics of growth and development in California as full of gladness for ourselves and perhaps of significance to the world.

CALIFORNIA WILL WELCOME THE FLEET.

Speed on the ship!—but let her bear
No merchandise of sin,
No groaning cargo of despair
Her roomy hold within:
No Lethian drug for Eastern lands;
No poison-draught for ours,
But honest fruits of toiling hands
And Nature's sun and showers.
—Whittier.

There can be perhaps no more dramatic demonstration of the return of peace than the flight of the war-fleet of the American navy from the Atlantic to the Pacific—the flight from war-troubled to peaceful waters: the very name expressive of nature's beneficence and descriptive of the glad escape of mankind from the last few years of unexampled crime and outrage on the sea. It is fitting to celebrate the peace of the Pacific by the impressive maneuvers of the grand fleet which preserved its peace by its achievements upon the Atlantic. And it is more than a celebration to awaken national gratitude for what has been done: it is a guarantee for future peace and an assurance that this continent will be safe for Americanism and democracy. And it is this fleet which constitutes Whittier a prophet, for it not only bears no slaves, but it is assurance that no remnants of autocracy

shall safely cross its bows, and it carries no drugs nor drinks for human degradation—for are not its bunkers full of grapejuice? And as for "fruits of toiling hands and Nature's sun"—not even Whittier could have foreseen that California could have literally produced nearly a quarter of a billion dollars' worth of fruit products for world enjoyment last year! And if one takes Whittier in the broader sense which he intended, and applies his vision of the service of the ships of peace, which this fleet will safeguard and for which it will point the way to the world through the American canal at Panama, we then have a prophecy of the merchant fleet now being realized, which will ply from our coast to and from all coasts in the trade which our production needs and supplies, and which shall never again be menaced by peoples seeking world dominion by other means than merit in production and commerce through honest industry and humane governmental policy.

The coming of the national fleet with something like 250 vessels, of the greatest of which the like have never plowed Pacific waters before, is a great event in the history of our western front of the nation. And these naval monsters, which are really lions of the vast deep, will disport themselves like playful kittens around the feet of the kindly Daniel (front-named Josephus), who is their lord and master. And besides these leviathans there will be lesser craft of all warlike kinds and conditions—making a peaceful holiday in the waters of San Diego August 7 and 8; of San Pedro, August 9 to 13; and of San Francisco, August 15 to 22. It is to be a visit of open cordiality openly arrived at, for Admiral Rodman announces that he desires the 30,000 men who float with him to meet and know the people they protect and the grand country they serve. And the response on the part of the people will undoubtedly be the greatest popular demonstration which Pacific coast people have ever put their hearts into, for, as a current writer says:

As ships and men enter San Diego bay to make the first call on the coast entrusted to them, they will receive from the people of the West a "welcome home" that will last through every Pacific port they put into. The West will have come into its own at last, for the heart of the West has been with the Navy always, the Navy of which it read, to which it sent its sons, but which it has never seen before in its full might.

Let every Californian who can, "Speed on the ship!"

THE FALL FAIRS!

What land is this? Yon pretty town
Is Delft, with all its wares displayed;
The pride, the market-place, the crown
And center of the Potter's trade.
—Longfellow.

And while we rejoice over the fleet with all that it suggests of national strength and safety, which is a national surety of peace to come, we should not forget that the crowning victory of peace is the opportunity for industry—to make homes, to till fields, to build factories, and to cause the markets to bustle with trade. What the poet sang of the most ancient craft of the potter is true of all the industries which are honorably pursued to serve the uses of mankind. Our cruel, ambitious foes must seize upon industry to compensate their wrongs and to regain respect and credit in the world. Americans must pursue industry to repay the cost of their rescue from ruin and to answer their call to new greatness and prosperity. Incidentally they must regulate industry lest a threat of worse domination than that which they have just happily escaped, is realized upon them. Obviously, the greatest material victory of peace is the present outlook for industry and the disposition to hold it in honest service to the public and not to install it in mastery.

California is fast realizing all and more than the pioneers prescribed, and more also than the most far-seeing of their followers could have predicted, even a few years ago. Production, trade, wealth and population are increasing beyond all anticipations. World-interest for purposes of home-making and investment was never so great as now. Popularity and demand for farming, live stock and equipment; for factory-sites, trade-opportunities, export-ventures, institutional extension and establishment—for everything, in fact, which stirs the thought and action of progressive men and women,

is now being inquired for and secured as never before. It is just the time to strike for the greater development of the State which our conditions and our opportunities invite, and every wide-awake Californian should take a hand in it. In this way we can extend the field of one of our newest industries and make all California a moving-picture of American development and progress.

For ourselves we propose to pursue one line as now most timely and influential in celebrating our share in the victories of peace and that is in promoting the greatness and success of this fall's fairs. If adequate interest and effort can be aroused it will be very easy to constitute every point at which a fair is held this fall "a pretty town with all its wares displayed: the pride, the market-place, the crown and center" of our farmers' trade. It is exceedingly important that this should be done, the State is full of people who are looking and thinking and to whose knowledge of what California is doing and can do we should patriotically minister. We should have a greater State Fair this year than ever before and the circuit of great displays which is now being arranged for as well as the host of local fairs which supplements the grand circuit, should all be carried forward with the fullest liberality of funds and endeavors. Every man and woman who is entrusted with effort for these educational and patriotic exhibitions should begin at once a personal effort for a wonderful success. During the next few months we propose to see to it that no such effort shall fail for lack of information and exhortation.

PRODUCERS' PROPAGANDA.

Griefs of mine own lie heavy in my breast,
Which thou wilt propagate to have it pressed
With more of thine. —Shakespeare.

Never before was systematic propaganda such a munition as during the last war, and never before has such propaganda been so widely invoked, both to preserve peace and to destroy it, as it is being so invoked at this moment. It is a great moving force, either for good or for evil, according to the motive which actuates it, but of that we have naught to do. There occurs to us rather a notion of industrial propaganda, and how much more convenient it is to seize upon the recent enrichment of our common speech and speak of propaganda instead of the awkward phrases "continuous promotion" or "well-sustained advertising campaign," which not long ago were our only recourse. And it is not only convenience which is involved, for there comes now to everyone, who has a good thing to push, a consciousness of duty to make it known and influential through propaganda. Of course, one who has a bad thing to push has a hunch that he too must propagate—but we have naught to do with that. It is an interesting fact that our most famous California products, which have won their way to great popularity have been doing it for some time successfully by particular propaganda. It is true, of course, that our wheat made hot-cakes of itself, and our beans were going by trainloads to Boston for decades before the Government inverted the propaganda process by turning it back upon bean growers instead of its proceeding from them upon consumers of beans. It is still true that our products which were not regarded as staple foods, but as luxuries, have for the last decade or more been possessing themselves of the advantage of staple standing by the force of generous investment in propaganda. Our oranges have fought the apple at the breakfast table and in the dessert courses to a receipt of millions more of dollars than the seductive Sunkist advertisements cost, while our raisins achieved even a higher dramatic success by vaulting out of an occasional rice-pudding into our daily bread—with such universality that even the child at its mother's knee has come to add the words "with raisins in it" to the nightly petition. Prunes and walnuts too would have undertaken propaganda before this if the price had not precluded the need of it, and it will be practically the same way with apricots, peaches, and pears this year. For them, and for all other distinctive fruit products of California, propaganda remains as a preventive of decline to the disasters of the time before the propagating art was invoked to relieve the griefs which did lie heavy on the growers' breast—as the poet said.

And it is fortunate that propaganda is now contemplated by other California high-class products aside from the horticultural lines. At the meeting of the California Dairy Council in this city, of which Mr. Whitten has given appreciative reports in our last two issues, there was specific recommendation by several speakers that the future of the dairy industry depends upon the enterprise of producers in educating the public by attractive display advertising in high-class consumers' journals to set forth not only the deliciousness and wholesomeness of all the compounds and products of pure milk, but the actual, indispensable food value of them as associated with refreshment and delights to the palate. Such undertaking as advocated by the Dairy Council is fundamental to the expansion and price-support which the industry needs to enable it to embrace the opportunity which imbibatory legislation has created. It is such a propaganda which is required to garland the cow with her peace victory decoration and she should have it.

THE COOLING OF THE CAKE.

—the kneading, the making of the cake, the heating of the oven and the baking: nay, you must stay the cooling too or you may chance to burn your lips.
—Shakespeare.

In the speed with which development affairs are now going Californians should keep cool. There will be a great cake cut in this State if it is not spoiled in the baking. We shall need courage and confidence but must not become flighty and visionary because everything seems to be coming our way. We need reasonable optimism and abounding patriotism. In one of the public parks in Los Angeles on July 4th, ten thousand persons were served with "cuts" from a single cake, which was a feature of the celebration, and it was six feet high, four feet thick and weighed nearly half a ton. There were no casualties for the cake had been carefully cooled!

QUERIES AND REPLIES

By the Editor.

Inquirer Must Give Full Name and Address.

Clean or Green?

To the Editor: Ever since I came to California in the spring of 1915, I have been a careful reader of the Rural Press, and it has been a decided help to me in many ways. At the present time I am between the devil and the deep sea in regard to clean cultivation. I know that clean cultivation as practiced about Orland tends to burn up the organic matter in the top soil. The soil contained very little such matter because of the grain farming of previous years. Our winter season is too strenuous for leguminous cover crops. Each year my ground takes water less easily and retains it for a shorter time than when I began in 1915, no matter how deep the mulch. I have decided on a very definite plan to be followed for the next three years, and I expect it will create talk when I begin operations this fall. I would like to see some articles in the Press by those who practice clean cultivation and by those who do not. What all the land in the Orland project needs, except perhaps the black sediment soil, is organic matter. I am going to bend every effort in that one direction regardless of looks or anything else.—R. O. K., Orland.

That sounds rather desperate. If you had told us what you propose to do we might be able to judge whether you should have a guardian appointed or not.

As for "clean cultivation," it is very hard to find an example of it nowadays because it really means the destruction of everything that tries to grow, either summer or winter, by the frequent use of the cultivator. Whenever a man allows weeds to grow in the rainy season and plows them under, he is no longer practicing clean cultivation: he is on his way toward green manuring. Clean cultivation in summer is not "clean cultivation" as it was originally practiced in this State when the name arose. It would be very hard to find anyone who is now a "clean cultivator"—because practically everyone understands and practices the advantage of plowing under weeds, rye, or other grain, even if he does not undertake to sow any of the legumes which are commonly prescribed and widely used—and it is a pretty dry copy of the Rural Press which does not contain some reference to that doctrine and practice. We cannot admit that you are

right in considering your winter too strenuous to grow legumes for we have seen too much wild bur-clover, medic, and sour clover (not to speak of native California clovers) covering your region in the winter to admit that legumes will not grow. But you are exactly right in claiming that your land needs more organic matter in the soil, and we are very curious to know by what desperate ways you are going to try to get it.

Rose Weevils.

To the Editor: I am sending you some tiny beetles that are playing havoc with my roses, puncturing the buds and spoiling the blooms. What can I do with them.—Mrs. J. P. W., Los Gatos.

To the Editor: What can we do to prevent the ravages of a weevil on our roses. The insect is dark brown, about one-quarter of an inch long, with a snout one-third as long.—A. R. S., Atascadero.

You are probably out of the range of its injuries by this time for it has rather a short run each year—usually about a month, and few are found after May in the interior valleys, or after June on the coast and at elevations. Gathering and burning injured buds as soon as seen cuts off the increase for the grubs feed inside the capsule until they take to the ground for transformations. Thorough spring cultivation will reduce the numbers of the pests to appear on the spring blooms. When the beetles appear on the bushes they can be collected by jarring the bushes over a sheet or a shallow pan of water on which a film of coal oil is floating. The beetles can also be reduced by spraying or powdering, when you see the first of them, with lead arsenate—but we always hesitate to advise poisoning posies for children, big and little, like so well to carry the stems in their mouths.

Seed Potatoes.

To the Editor: I have several hundred bags of small potatoes which, owing to the absence of moisture, are about the size of a large hen egg. They are smooth and clean, free from disease, and were grown from very fine Oregon seed this spring. Will these be good seed for this fall? I would like to plant whole. Is it better to clip off one end—seed end or stem end?—L. J., Hemet.

The potatoes which you describe are certainly suitable to use as seed for a fall crop, provided they are fully matured and the eyes well developed before planting. It is not desirable to cut off either of the end and they can be planted whole as you propose. Experiments by Prof. Rogers of the University Farm indicate that, in the hot valleys at least, maturing of the seed can be best secured by holding the first crop seed in long piles two to three feet deep in a shady place, covered with several inches of straw and frequently sprinkled to keep the potatoes from getting too dry and hot. Too much heat seems to injure the tubers for midsummer planting. If held with reasonable moisture and reduced heat they seem to develop better eyes. Planting deeper than in fall or winter is also desirable.

Manure on Uncovered Subsoil.

To the Editor: Is it good policy to apply stable manure before sowing alfalfa on ground that has been scraped pretty heavily in checking up for alfalfa seeding? Do you think it would have a tendency to keep the roots up near the surface, making it take more water? What would be the best way to apply the manure, or rather get it into the soil? Do you think inoculation advisable in this case?—F. A. Y., Chowchilla.

It is a good policy to use stable manure liberally on uncovered subsoil and to plow it under as deeply as you can for any kind of a crop. It is not desirable, however, for some crops to get in a lot of coarse manure and sow before the manure has enough time and moisture to rot and settle down. If you can put on water now and plow the manure into moist soil, and then work the soil well for a good seed bed before you sow the alfalfa this coming fall or winter, you will surely get a more even stand and a stronger growth, and the soil will take the water more uniformly next year. You need not fear of making the plant too much of a surface rooter. It will go after the water and the manure extract, which will go down with it—unless your land has hardpan or is too heavy below. In that case the land ought to be shot! Inoculation is insurance against a possible natural deficiency of bacteria in the uncovered subsoil.

IS THIS YOUR PROBLEM?

Are you feeling the pinch of the continued high cost of living? Food and clothing still high, with no relief in sight. Your earnings no greater, and not enough coming in to cover all expenses.

We can solve the problem for you. Take up our circulation work. It is a free, independent life in the out-of-doors, attending to our renewals and securing new subscriptions. You will like it, and you will find just the opportunities you have been looking for.

Straight salary, permanent work. No investment necessary except that you must have an automobile. Write us at once telling about your qualifications and experience. Full particulars will come back and you will be glad you investigated.

Safe to Remove Knots in Summer?

To the Editor: Is it all right to treat Tragedy prune trees for crown gall at this time of year, immediately after crop is harvested, and do I use the right plan when I cut all diseased tissue out and cover the wound with Bordeaux paste?—G. W., Exeter.

We are not aware that the safety of removing knots of considerable size from bearing trees during the growing season has been publicly demonstrated, though probably some of our readers have experience in that line which they are requested to communicate to us for the public good. Until we get assurance in that way we answer that such root-surgery is usually done during the dormant season and, theoretically, it would be safer to allow the tree to use the sap channels it is currently using until it finishes its season's job, and it is probably on that basis that such work as we know of on old trees has been done in the late fall or winter. On young trees knots are safely removed as soon as seen and their extension is thus arrested. Bordeaux paste is the usual application though asphaltum is also used.

White Berry Scale.

To the Editor: What ails by blackberries and loganberries? The stems are all covered with a white or greyish-white scale on the bark, and no berries come on the vines this season. Please tell me what to do.—L. C. D., Bradley.

It is the worst infestation with the rose or berry scale (*Aulacaspis rosæ*) we ever saw. The scales are fairly felted over the bark—as they overlap each other so thickly. As the plants have made no leaves this season we presume they are dead, and in that case we should pile straw around them and burn them all off clean, making the fire hot enough to kill those just below ground also. If, however, you see shoots coming from the roots, you can cut off all the top growth as low down as you can, burn it up by itself. Then rake away the loose dirt so as to lay bare the shoots and top roots, and spray with kerosene emulsion. The chances of getting clean plants from such infestation is, however, very small indeed and we would prefer to burn up the whole outfit and start over this winter with new, clean plants on another piece of ground.

Diabrotics on Roses.

To the Editor: Can you tell me what to do to kill the bugs on my rose-bushes? The bugs look very much like the little red lady-bugs, but are green in color.—G. P., Brentwood.

These are the pestiferous "green lady bugs," but they are not ladybirds at all, either in classification nor in the things they live on. They can be killed by spraying the things they eat with lead arsenate (3 lbs. to 50 gallons of water), but a ripe apricot or a pretty flower which is poisoned that way is dangerous to people. If you care enough for your roses you can do two things: cover the bush with mosquito netting so they cannot get in or put on an old pair of gloves and pinch hard every bug you catch. If you practice enough so that you can catch and pinch with both hands independently you can soon reduce them notably. These pests are very abundant and then practically negligible for several years. This is the only comforting thing we know about them.

California Weather Record.

The following rainfall and temperature record is furnished the Pacific Rural Press by the United States Department of Agriculture Weather Bureau at San Francisco for the week ending at 5 p. m. July 22, 1919.

Stations—	Rainfall		Temperature	
	Past Week	Seasonal To Date	Normal To Date	Highest Lowest

Tile Drainage Pays Big Interest on Cost.

Written for Pacific Rural Press by R. E. Hodges.

Despite the high prices of tile, the profit from its use as demonstrated in recent years around San Francisco Bay in Santa Clara county, has led many land owners there to continue their drainage extension the past winter and spring.

Chief among the progressive projects is that in which about a dozen land owners got together and laid 9,000 feet of main-line drain tile to take the water from six or seven systems at present, as well as a great many more eventually. This main line consists of 1,500 feet of 16-inch pipe, 3,000 feet of 14-inch pipe, and the rest of 12 and 10-inch diameter. This drains a maximum of 1,500 feet on each side of the tile line, taking all surplus water from a long strip of land between the road and Campbell Creek, into which the tile empties.

This main line takes water from several systems already installed. One of these is that of Frank Wilcox, whose experience was related in our columns a year or two ago. Mr. Wilcox has been reclaiming as much as financially possible of his ranch by tile drainage for at least half a dozen years, finding that land which could not be plowed before, works nicely right after tile are put in, and still better after the first year. He will finish draining his entire ranch this season. It was two years ago that he said he would gladly pay \$20 per acre just to get a satisfactory outlet for the tile on one piece of 20 acres. Now he has it. The work was recently completed by Geo. H. Frith, who first made his own farm near Agnews workable by drainage, and then undertook the same kind of work for many others around the Bay, using a ditching machine.

Another notable contribution to the prosperity of the Valley was the tiling last winter of 114 acres belonging to C. T. Clifford in this district. This

BEAN TRADERS ENRICHED WHILE AMERICANS BLED

A couple of million of our men who gave up their work and their homes and their immediate chances for advancement in order to offer their lives for their country, knew that those who stayed at home might profit by their absence. They made no objection to that. The farmers who were urged by the Government to raise big crops even at the hazard of peace destroying their markets, raised the big crops and have not objected to the legitimate effects of peace on their markets. But the millions of soldier boys and the millions of farmers who served their country, had a right to expect that the rest of the American people would not trade on their sacrifices.

It has been known that the bean market in California was sick and that Oriental beans were being imported. Petitions for a tariff on those imports have been ignored, but still righteous indignation held its bounds.

But it has lately come to light that an official of a certain bean-importing firm loaned \$40,000 a few months ago to a certain buyer of beans for the U. S. Grain Corporation, and shortly thereafter the Grain Corporation gave that firm an order for 36,000,000 pounds of Oriental beans, at a price above California prices. That order was at one time rescinded, but was again put into effect and delivery was completed about eight weeks ago. During this time the California Bean Growers' Association has been pleading for a chance to sell to the Government at most any price that would pay the cost of production; but has been unable to sell any great quantity.

Aaron Sapiro, an attorney of San Francisco, over 35 years of age and the father of two children, was one of the men who did not have to go to war, but who gave up his practice and his home and volunteered last spring when days were darkening for the Allies. He is back again and is making it his business, not necessarily to prosecute the men who dishonorably became rich while he was offering his life, but particularly to get the facts which may be laid before Congress to waken that body to the righteousness of a tariff that will give our beans a chance at the market at least until Christmas. He and others on a special delegation are holding themselves at the call of the Ways and Means Committee of Congress. Now may they win! And now may you bean holders, whose battle these men are fighting, back them up with letters and petitions over your signatures, urging the Ways and Means Committee at Washington and your own Representatives and Senators to put this thing over.

included 3,000 feet of twelve-inch outlet and about 50,000 feet of laterals. All of the laterals, for the sake of economy in buying, are of four-inch diameter.

About a dozen lines, each 2,500 feet long, were laid on a slope of three to three and a half inches per hundred feet on land which has heretofore

had water standing on it until June, turning green and foul, preventing growth of anything with much value. As the tiling progressed last winter, men, stock, and machines worked over this same land within three days after a rain. It had been said that four-inch laterals on such a slope and in such long lines would not carry

enough water. It was true that they were found full 1,500 feet from the main line, into which they emptied with some force. This farm will be planted to pears. Orchard trees do not bother the tile, though willows, poplars, gums and cypress fill tile with roots.

Some Other Projects.

E. M. Ray has drained 400 or 500 acres near Gilroy with over 300,000 feet of tile. L. B. Dutton, whose experience raising alfalfa in an old willow swamp has been related in Pacific Rural Press, has been reaping his reward in the shape of increased alfalfa crops since we first visited him. W. R. Thorsen is just starting to dig and place 30,000 feet to drain into Campbell creek.

Costs of Tiling.

Most of this work is done by a tile ditcher, which digs the trenches with practical assurance of uniform grade at a cost of \$40 to \$50 per thousand feet, where they average four feet deep in this kind of soil (silty adobe), according to Mr. Frith. A sort of shoe slides along the bottom of the trench at the rear of the digger, making a narrow groove about an inch deep. A man rides the shoe and lays tile as fast as the digger works ahead. The groove prevents tile from rolling out of line while the trench is being filled. Four-inch tile are said to cost about \$45 per thousand feet. It costs about \$10 per thousand feet to lay the tile. Filling the trenches is subject to a road-grading outfit and costs about \$10 per 1,000 feet. Thus the total cost of laterals should not be over \$115 per 1000 feet, or not over \$50 per acre. The job once well done is permanent; and it immediately adds several times its cost to the value of many areas and pays profitable interest on money invested wherever free water stands long in the upper four feet of soil.

The Phosphorous Situation.

The considerations introduced by me into the potash discussion are not without their just need of significance in relation to the phosphorous question. For example, it must be remembered that when any phosphate fertilizer is applied to a soil, other things are introduced besides phosphorous. Such other things may be gypsum, small quantities of free sulphuric acid, calcium in different and more or less soluble forms besides gypsum, as well as other substances, depending on the kind of phosphorous fertilizer which is applied. It goes without saying that any or all of these substances must exert a greater or lesser influence on the constituents of the soil and its solution; and that such influence may go far in the direction of improving plant growth on a soil irrespective of any phosphorous which may be added under such circumstances and which of itself may or may not exercise any influence on the crop.

Ground Rock vs. Superphosphate.

It has frequently been pointed out of late how easy it is in soil work to draw erroneous conclusions from what seem to be reasonably well controlled experiments. For example, in attempting to determine whether or not a given soil is in need of phosphorous, and if so, if a soluble or relatively insoluble form should be applied, we have adhered to the following procedure, which has been handed down to us by tradition.

A series of plots of the soil to be studied is laid out. Some remain untreated, some receive ground rock phosphate and still others receive superphosphate carrying equivalent quantities of phosphorous. Many other forms may be employed in the experiments now in vogue, but the simple case which I have assumed will serve just as well to make my point which will be just as pertinent to the more elaborate experiment. On these plots, we will assume further, that corn is planted.

At the end of the growing season, we harvest and weigh the crops from the plots and find that the yields are lowest on the control or untreated plots, that they are greater on the plots treated with rock phosphate, and greatest on those treated with superphosphate. What could be more natural, in such a case for the ordinary farmer, agronomist, or even soil chemist who has not imbibed the modern spirit of soil science, than the assumption that such an experiment not only proves the need for corn on that soil of phosphorous but of available phosphorous.

In the light of foregoing discussions, either or both conclusions drawn from the facts in question may be wholly erroneous. The increase in crop, due to the application of rock phosphate, may be due to the calcium contained in it, as well as to the phosphorous, since the calcium as well as the phosphorous will react with other constituents of the soil solution or furnish a larger amount of itself to the soil solution. Hence, the experiment does not prove that plants on the soil in question suffer for lack of phosphorous.

A more important consideration here, however, is the relationship of the superphosphate plot to the other plots. While it does so seemingly, the yield on the superphosphate plot actually does not prove that available phosphorous is needed more than unavailable phosphorous. As is well known, an application of superphosphate carries with it not only a large amount of soluble calcium and soluble phosphorous in the form of mono-calcium phosphate, but it also introduces a considerable quantity of calcium sulphate, which is fairly readily soluble in the soil water and like the soluble mono-calcium phosphate may

bring about profound changes in the nature and concentration of the constituents of the soil solution. The amount of soluble salts which superphosphate carries being greater in amount and variety than those of the ground rock phosphate, it is only natural to expect them to be more active chemically as well as physiologically and, hence, to increase the concentration of the soil solution and change its qualitative nature to a greater degree. Supposing, therefore, that the concentration of the soil solution in the soil in question should be too low and that factor limited absorption by plant roots, the superphosphate must necessarily improve conditions more than the rock phosphate for obvious reasons. If, however, the concentration of the soil solution should be great enough but its qualitative nature such that calcium is present in insufficient quantity, the superphosphate again, for obvious reasons, would go farther in improving the soil solution as a medium of plant growth. Hence, there are plainly other and fully as pertinent and justifiable conclusions to be drawn from the effects of rock phosphate and of superphosphate on soil and crop as the common and almost the only one drawn now to the effect that the phosphorous in them and that to the extent to which it is soluble should be regarded as the cause of increased yields like those assumed above. It is clear that any or all of these factors, at least, may be a true explanation, but if it is any one of them, we have not the means at present of establishing which one it is with certainty.

What a lot of candy is being munched since the first of the month by contemplative-looking office men.

Fertilizers and Fertilization--VI

(Written for Pacific Rural Press by Dr. C. B. Lipman, Professor of Soil Chemistry and Bacteriology, University of California.)

ANOTHER HOME-BUILT APPLE DRYER.

(Written for Pacific Rural Press.)

We recently saw a very efficient home-built apple dryer near Sebastopol, Sonoma county, which is under one roof with operating room and storage. It belongs to D. M. Searby. It is built on the edge of a side hill which has permitted the furnace and heat chamber to be built in the form of an outside basement so that ventilation (for regulation) of the heat chamber is arranged from two sides. Thus the prevailing wind is a consideration. This is a great thing, for with a north wind very much less artificial heat is needed.

There is no fan. The heat from the chamber below passes up through the dryer-chambers, which all lead the moisture-laden air up through a ventilator two and a half by one and a half feet inside measurement, and seven feet wide at the base.

There are two hot-air drums in the heating chamber with the usual double range of connecting pipes as explained in the Napa dryer. The larger drum at the back of the chamber is four feet in diameter and the smaller one is a little over three feet. To reduce heat the ventilators at the base of the heating chamber are opened as desired—there are seven each side. The drying chamber consists of six units, which have a capacity of 48 trays each. One and a quarter tons of dried apples can be turned out of this dryer per diem.

Danger of fire is reduced by seven plies of asbestos, being set between the brick work of the heating chamber and the wood of the superstructure, and the asbestos is further protected with tin. It is 56 feet from ventholes to the top of ventilator shaft.

The average time taken to evaporate apples is six hours to a charge. Either an oil burner or wood could be used with this class of dryer. Its original cost was something over \$2000.

Dried Wine Grapes-Value and Evaporation

(Written for Pacific Rural Press by John J. Fox.)

(1) Can you tell me the value of different qualities of dried wine grapes? (2) Who buys them and for what purpose? (3) What is the method of making wine from them? (4) How are they dried?

This is a series of questions that is cropping up increasingly of late. Last week we had a letter containing such questions from a subscriber in the South Seas (Tahiti). On this matter of such wide-spread importance we consulted Professor Fred T. Bioletti, and give here his remarks on "Methods of Drying and Returns," together with those on the "Principles of Evaporation," by Professor W. V. Cruess of the University of California now published in bulletin form (Nos. 14 and 15) by former State Board of Viticultural Commissioners.

How Are We Going to Save the Crop This Year?

"If wine-making should be definitely prohibited during the vintage of 1919, the only profitable means at present practicable to save any large portion of the wine grape crop is by drying it," says Professor Bioletti. "As dried wine grapes will probably find their principal use in wine-making, it is necessary that the fresh flavor of the grapes, and especially their color, should be as little changed as possible. Drying directly in the sun destroys the color of red grapes completely. Some of this color is retained by grapes dried in an evaporator as is the fresh flavor of the grapes, if the drying temperatures are kept low enough." A moderate sulphuring prior to evaporation helps to retain both flavor and color, the reason for which the Professor explains.

Use of Evaporators.

"In the coast counties and in the central part of the great valley which produce the bulk of the wine grapes, the only practical method of drying is by the use of evaporators, whose product is better suited for wine making than that obtained by sun drying. In the cooler and later raisin districts the methods of dipping before drying in use for bleached Sultaninas would be necessary."

Wine Is Made from Dried Grapes.

"It has been abundantly demonstrated that wine satisfactory to the consumer can be made from dried grapes. It is not equal to that made from fresh grapes of course. During the phylloxera crisis in France millions of gallons of wine were made there from sun-dried grapes imported from Turkey and Greece."

How Many Gallons of Wine to the Ton?

This depends on how ripe the grapes were when they were harvested, how much moisture is retained in the dried grapes and the alcoholic strength desired in the wine. For example: "A ton of fresh grapes with 23 per cent of sugar will yield about 550 pounds of dried grapes. If we ferment this with 180 gallons of water, we can obtain 180 gallons of wine with 11.5 per cent of alcohol. These figures are based on analyses of California dried grapes and on tables based on actual practice."

To Make Wine from Dried Grapes,

"They must first be soaked in water until they have imbibed the amount of water they lost in drying. They must then be passed through rollers to break the skins. By soaking in water of 150 degrees F. the process is hastened and the crushing is unnecessary but the resulting mixture must be cooled artificially or injurious fermentations would be likely to occur."

"In any case, after crushing or cooling a good vinous fermentation must be started by the use of a pure selected wine yeast. In all other respects the operations are identical with those used in making wine from fresh grapes."

Will It Pay to Evaporate?

Professor Bioletti is of opinion that at the prices offered for dried wine

grapes, it will pay growers a fair profit plus the return of the cost of the evaporator from the first season's run. This opinion is based on estimates of the cost of an evaporator, of cost of evaporation, on the known drying ratios of various qualities of grapes and on the prices now offered and paid for dried wine grapes.

Average Drying Ratios of Wine Grapes.

He gives this table as based on three crops of eleven varieties grown and sun-dried at the Kearney Experiment Vineyard (Fresno county):

One Ton of Fresh Grapes Gives:			
Balling (Sugar test)	Pounds dry	Drying Ratio	
17 deg.	439	4.56	
18 deg.	454	4.41	
19 deg.	470	4.26	
20 deg.	488	4.10	
21 deg.	508	3.94	
22 deg.	531	3.77	
23 deg.	556	3.60	
24 deg.	585	3.42	
25 deg.	619	3.23	
26 deg.	662	3.02	
27 deg.	722	2.77	
28 deg.	826	2.42	

"The riper the grapes the higher the yield of dried product. For each added degree of sugar the increase averages about 35 pounds of dried grapes per ton of fresh or over 7½ per cent."

The next figures given are of the utmost importance as showing the gain in matured fruit:

"On a vineyard with a crop of five

fruit evaporators have been described. For the proper evaporation of grapes the Professor says:

"In the evaporation of grapes, heat is necessary. The moisture-laden air must be removed rapidly and continuously, by a forced movement of air through the evaporator. The volume of air necessary depends on (1) the temperature of the air, and (2) its "humidity."

Each 27 degrees Fah. rise in temperature doubles the moisture-absorbing capacity of the air. For example: a given volume of air at 154 deg. F. has about twice the moisture-absorbing power of the same amount of air at 127 F."

"The air will, in most grape evaporators, enter the drying room at 145 deg. F. to 150 deg. F. and leave it at about 25 deg. F. lower. To obtain a reasonable rate in drying, the air must be allowed to leave the evaporator only partially saturated."

"In grapes of the Sultanina variety, rapid deterioration takes place above a temperature of about 145 deg. F., and it is believed wine-grapes are no more resistant. This relatively low temperature makes it necessary to use larger volumes of air to secure an expeditious rate of evaporation."

Dipping and Sulphuring the Grapes.

"Grapes dry much more rapidly if dipped at the boiling point in a solu-

25 per cent. Above this moulding and fermentation will cause loss on the dried product. They must then be securely packed to exclude insects.

Professor Cruess describes an evaporator that will hold six tons of fresh grapes per charge that can be built—trays, trucks, furnace, tracks, dipper, labor, and all for \$2,000 or less. If a man owns an engine or motor this cost will be reduced at least \$200. The specifications are based very largely upon the results of the practical experience of growers who have used it. He says: "It is recommended that the prospective builder obtain all information possible from users of commercially built outfits upon performance of their evaporators before purchasing. The trays made have wire mesh screen bottoms as the ordinary raisin tray is not very satisfactory for use in the dryer."

General Specifications

Are given in Bulletin No. 15. Some of the details still under investigation are as follows: Tray material, wood slats or metal. If metal wire mesh the size of mesh—probably between ¼ inch and half inch. The best temperatures for the complete operation. The best methods of dipping and sulphuring with regard to time, amount of material used and manner of handling. The volume of air necessary for the best results and whether draft or suction or both be used. Instruments and scientific points in connection with heat, humidity and condition.

The mechanical details will be probably worked out to the best advantage by owners on the basis of methods now in use.

The time necessary for evaporation of grapes is variously estimated by different men, according to Professor Bioletti, who gave the writer the above details. The time given for the operation varies from 6 to 24 hours, which must give a great variation in dried quality, but may be also partly due to the difference in drying qualities of various varieties and their degree of ripeness. The Professor thinks that it will probably work out at from 8 to 16 hours per charge, but nothing has been definitely established.

We are told that the dried wine grape can be used for food uses other than wine-making, though they could hardly compete with raisins. Foreign markets are being looked for and investigated by men at the head of the Viticultural Industry. With many active minds at work on a single project it is not overanguine to hope for some workable outcome that may save the best of the vineyards to serve some useful purposes in the manufacture of syrups, vinegar, conserves, or what not. A large tonnage of cull Malagas, Sultanas, Muscats, Thompson Seedless and Fehrzagos is involved as well as the winegrapes in this great salvage scheme.

VARIETIES OF CALIFORNIA STRAWBERRIES.

The varieties of strawberries grown in the Gardena district (Los Angeles County) are Klondykes, and Baldwins, also Excelsior and Nickomar. In the San Gabriel Valley the Brandywine prevails. In the Pajaro and San Juan districts and the Santa Clara, Banners and New Oregon are the chief varieties while in the Florin district (Sacramento Co.) the Oregon, Dollar and Jesse are the favorites. According to the Bureau of Crop Estimates, Southern California has 1330 acres in Strawberries this year; Central and Northern California 1120 acres; Central and Coast districts 1100, making total of 3550 acres for this season.

Push on—keep moving. Stagnation means decay and you don't want to be taken for a dead one yet.

A type of home-made evaporator in the San Joaquin Valley with the furnace at one end and draft or suction outlet at the other end of evaporating chamber.

tons per acre, the increase in gross returns, if the dried grapes were sold at seven cents a pound would be over \$12 per acre for each degree of sugar. The drying ratios that would be obtained in an evaporator might be slightly higher than those of sun-dried grapes given in the table."

Cost of Evaporation.

"At present prices for labor and material it may be fairly estimated that the actual running cost of an evaporator drying six tons of fresh grapes per 24 hours would be close to \$6 a ton of fresh grapes. If we take an average sugar content of the grapes as 23 degrees Balling and a price of 7 cents per pound for the dried grapes, we get for a season's run (of 30 days) for an evaporator drying six tons every 24 hours, the following balance sheet:

Grapes—180 tons at \$20.....	\$3,600
Drying—180 tons at \$6.....	1,080
Total cost	\$4,680
Dried grapes—100,000 pounds at 7c.....	\$7,000
Net profit of drying.....	\$2,320

We had a man in the office only yesterday saying he had been offered 8½ cents flat if he would evaporate his grapes. Others, with finer varieties, have been offered 10 cents. The method described by Professor Bioletti's outline a manner in which the crop can be harvested and sold or stored.

The Principles of Evaporation.

A number of home-made evaporators have been studied by Professor W. V. Cruess, with the two governing factors always in view as of primary importance. These two factors are efficiency in operation and cheapness of construction. In recent issues of the Pacific Rural Press, various types of

tion consisting of one pound of lye to 30 to 50 gallons of water. Therefore, a dipping outfit is recommended. The ordinary prune dipper has been used with success on Tokays.

In Sutter county, black sheet-iron tanks are used to heat and hold the lye solution. A dipping basket, the shape and size of a lug box and made of heavy screen wire is used for smaller operations. White grapes will be improved in appearance by exposing to the fumes of burning sulphur for 15 to 20 minutes after dipping. Laboratory tests have indicated that similar treatment will improve the color of red grapes for wine-making."

Operation of the Evaporator.

"The grapes should be evaporated as soon after picking as possible, says Professor Cruess, for specified reasons.

The grapes are dipped in the above boiling solution for a period long enough to cause the skins to develop minute cracks—about three to five seconds. They are then rinsed in clean water.

Sulphur or Not as You Please.

Spread bunches on trays preferably only one bunch deep. A 3-foot square tray will hold 30 to 35 pounds of grapes. The grapes are run into the drying compartment on dryer cars. The heat is generated to 145 deg. F. at point of entry and the interior heat is observed on thermometers in front of small glass windows in the drying compartment."

"The dry air is forced through the chamber till the grapes are dried to a leathery consistency. The finished raisin should contain about 20 per cent of moisture. The amount of moisture is extremely important because the profits will vary according to the moisture content up to about

Of Interest to Fruit Growers

(Written for Pacific Rural Press.)

Near Selling Plan for Deciduous Fruit

All receivers and auction companies in New York have decided to block together in their auction catalogues of fruit shipments, according to a notification to this effect received by Charles E. Verdon, general manager of the California Fruit Distributors.

Cantaloupes. Increase of Production.

The yearly shipment record of cantaloupes from Imperial Valley is as follows: 1913 season, 2171 carloads; 1914, 4,065 cars; 1915, 3,693 cars; 1916, 4,142 cars; 1917, 3,148 cars; 1918, 4,094 cars and to July 1, 1919, 6,768 cars.

The Oregon Growers' Co-operative Association.

Seventy-five representative fruit and nut growers from every important producing district in Oregon met recently in convention at Portland and organized under the above name. It closely follows the California plan of organization, and is the largest of its kind ever attempted in the Northwest.

A Fortune for Somebody.

"It costs about \$40 a ton to husk strawberries for canning," said the manager of one of our large canning companies recently. The man who can produce a strawberry that husks easily and is yet a firm berry for canning can make a fortune. For it would be of great value to all consumers of the strawberry crop.

The Ukiah Fruit Evaporator.

The Cunningham Dryer at Ukiah will dry the "orchard run" of growers' pears this season. We understand that over 600 tons of No. 1 pears will be dried here this season as a starter. Experts have expressed the opinion that the pears grown and cured here should be equal to those of Lake County in quality.

California Pear Growers' Association

"Gratuitous applications for membership in this association are coming to the office every day," said President Frank T. Swett. "We have nobody out soliciting membership, but the new members are coming in so that they may get the benefit of the association prices. We have so far sold between 14,000 and 15,000 tons of pears to the canners. There will be 50 per cent more pears dried this year than usual." The pears on the river now being shipped are of excellent quality and are in strong demand.

Standard Apple Act Self-Supporting.

For the year ending July 1, 1918, the state appropriated \$5,000 for the enforcement of the Standard Apple Act. No appropriation was made or asked after that date for the reason that the revenue accruing from the sale of apple grade stamps, at one-half cent each, reached the sum of \$13,543.66 during the apple shipping season of 1918. There is every reason to believe that from now on this branch of the Agriculture Department's work will be self-supporting. The value of guaranteed standardized fruit can no longer be questioned.

Dumping Green Fruit.

The annual spasmodic attempts to dump some green fruit on the market have been, as usual, frustrated by the officers whose duty it is to protect the industry. Commissioner Fred Rouillard of Fresno County has turned back the first shipment of Thompson seedless, other commissioners have turned back peaches, plums and cantaloupes. We have the best quality fruit this year ever obtained. We have the best prices, the best crop and a record demand, and we intend that our markets shall continue to respect the quality of our packs.

Apricot Pits.

Before the war Germany and Denmark used to take our apricot pits, paying \$45 a ton for them. After the

war started and shut these markets off, the price dropped to \$15. The Prune and Apricot Growers' Association became interested, and last year agreed to pay \$31.50 a ton cash on delivery, and as much more as there was in it. The final settlement netted growers \$37.50 a ton or nearly two cents a pound. It pays to save the pits and let the association handle them. A still better price may be obtained this year if enough pits are delivered.

Cutting Back Young Walnuts.

Revisiting the S. P. Stow Company orchard last month at Golita (Santa Barbara County) we noticed that the large 6-year old Eureka walnut orchard had been heavily cut back. For over heavy growth of foliage was breaking trees last fall. The trees are 33 feet apart and look very promising. They were cut close down when they were planted and thus made a new stem and prodigious later growth. Pinching through the seasons might have avoided so much heavy cutting. The ranch has one of the oldest Eureka lemon orchards in the state (adjoining the walnuts). There are 30 or 40 acres of them—said to be 40 years old.

Management of Strawberries.

Jackson Bros. (nurserymen) near San Jose planted out 19 acres more strawberries this season—New Oregon and Banner. Fifteen thousand plants go to an acre and they are set in double row beds with irrigating furrows between. The ground is leveled in contour and the labor is contracted. One Jap family takes care of about three acres. This would be equivalent to about one man to the acre. The berries are irrigated once a week and picked once a week. Some sulphuring has been done for red spider. On their old beds last year they produced 12 tons of strawberries to the acre. This beats alfalfa for tonnage.

Propaganda to Disrupt Growers' Organization.

The ridiculous yarn about 10 cents being the price to be paid for raisins by independents while the association prices will be much lower, is such a palpable "bait" to lure away the credulous that it's a poor fish that would rise to it. For the intention is to injure the Raisin Growers' Association. Wylie M. Giffen, president of the association, says: "There is not a single concern in business today that would buy 10,000 tons of raisins at ten cents a pound without knowing what the association prices are going to be. Our duty is to sell the entire crop of raisins for the most money that we can possibly get. We believe that what has always been true will be true again—that our prices will be more than the average of outside growers. The keystone of an organization like ours is honor on the part of its component members. The undivided loyalty of the

9,000 growers with whom we now have contracts will make our position impregnable. We have already sold at a price to be named later a large percentage of this year's crop. If these contracts could not be filled our written pledge would be worth less than a scrap of paper. Under no conditions will we voluntarily agree to the release of any crop."

THE NEW IRRIGATION LAWS.

The new laws relating to irrigation go into effect July 22, when the new Department of Agriculture comes into being. One of these (Senate Bill 493—Senator Irwin of Kings County) will help to break up the large tracts of land now owned by corporations and transform them into small holdings. For it makes possible the organization of an irrigation district by a majority vote of the registered voters living within the boundaries of a proposed district instead of a two-thirds vote which was formerly required. A majority vote on property values is also essential. The farmer must control the water as well as the land if permanent success is to be assured. Irrigation districts have been prevented from organizing often by large land owning corporations, who do not want to be taxed on their vacant or dry farmed land for improvement and do not want to sell. Immense quantities of water are available in the two great interior valleys and only organization can pay for its development and distribution—by the formation of public districts having the power to raise the requisite money by the issuance of bonds. Forty-four such districts are now formed and operating under the Wright-Bridgford Law.

VETCH IN ORCHARDS.

To the Editor: Would you advise sowing inoculated vetch in a young orchard for cover crop this fall on land that can be irrigated? How would it do for an old orchard to be disked in the spring without plowing?—S. A. M., Modesto.

We certainly believe in sowing vetch early in the fall in orchards which can be irrigated. Whether it should be inoculated depends on whether the inoculation would make enough greater growth of the vetch to justify the expense. We know of a number of people in your district who have found vetch inoculation in grain fields highly profitable. While you would probably get more or less of a crop without inoculation, we believe that while you are doing it, you might as well get the best possible, and this is only to be obtained by inoculation according to directions. The object of the vetch is to add nitrogenous fertility to the soil in the cheapest form possible. If you disk it in the old orchard in the spring, you still have a great deal of the value available for that year's crop, but a great deal of it will remain in a dry, unavailable condition so long as it stays in the surface layer which dries out through the summer. It will help to make a good mulch, unless it loosens the soil too much because of heavy growth.

SULPHUR

It has been proven and so recommended by the University of California that if you sulphur your grape vines and orchards 3 times they will not be affected by MILD EW or RED SPIDERS.

ANCHOR Brand Velvet Flowers of Sulphur, also E. A. G. I. E. Brand, Fleur de Soufre, packed in double sacks, are the fluffiest and PUREST sulphurs that money can buy; the best for vineyards; the best for

bleaching purposes, LEAVING NO ASH. VENTILATED Sublimed Sulphur—Impalpable Powder, 100% pure, in double sacks, for Dry Dusting and making Paste—(Atomic Sulphur).

For LIME-SULPHUR SOLUTION, use our DIAMOND "S" BRAND REFINED FLOUR SULPHUR. We can furnish you this Sulphur at such a low price that it would pay you to mix your own solution and net you a profit equal to the amount paid out in labor for spraying your orchard, even if you pay your men \$4 per day for making the solution and applying same.

To create additional available plant food, drill into the soil 100 to 400 pounds per acre DIAMOND "S" BRAND POWDERED SULPHUR, 100% pure. This has increased various crops up to 500%.

Also PREPARED DRY DUSTING MATERIALS, Tobacco Dust, Dry Bordeaux, Dusting Sulphur Mixtures, etc. And "Anchor" Brand Standard LIME-SULPHUR SOLUTION 33 deg. Be., Sulphur Paste, Nicotine, Black Leaf 40, etc. Fungicides and Insecticides. Carried in stock and mixed to order.

SAN FRANCISCO SULPHUR CO
824 California St., San Francisco, Calif.

We are equipped to make immediate shipments. Send for "ILLUSTRATED BOOKLET"; also booklet "NEW USES FOR SULPHUR." Price-list, and Samples.

Please state for what purpose you use the sulphur, quantity needed, and date of shipment preferred.

APIARY DEPARTMENT
CHICO, CALIFORNIA, U. S. A.

PRUNE PRICES—THE STRAIGHT OF IT.

The California Prune and Apricot Growers, Inc., have determined opening prices on prunes as follows: 20-30s, 22 cents flat; 30-40s, 16 cents basis; 40-50s, 14 cents basis; 50-60s, 12 cents basis; 60-70s, 11½ cents basis; 70-80, 11 cents basis; 80-90s and 90-100s, 11 cents basis. From 100-120s, 8½ cents flat and 120 upward, 7½ cents.

Prices are difficult to compare with any straight basis price, but might be said generally to be better than a 12-12½ cent ordinary base, according to H. C. Dunlap, Secretary-Treasurer of the Association. On the 20-30 flat price, one point in the 30s is included; in fact, all these bases overlap one point. Two dollars a ton more will be paid on 27s; \$5 more on 26s; \$10 more on 25s; \$12 more on 24s; \$15 more on 23s; and \$20 a ton more on any points below 23. The 30-40 grade includes 32-41. The price then on 35s would be 18½ cents; 36s would be \$1 a ton less, and 34s, \$1 a ton more; every extra point within grade size adds \$1 a ton up to the 91-100 grade.

First payment will be 15 cents a pound in 20-30s, and on an 8-cent basis from 30-100. Five cents a pound on anything smaller than 100. On ordinary sizes, growers delivering their fruit in good condition before September 20 will participate in the fund that develops as a result of one cent a pound premium on September deliveries to the trade.

In some sections there has been a little injury from sunburn and here and there a little split fruit, but the crop generally is in splendid condition.

HORTICULTURAL JOTTINGS

There is a difficulty in some sections of getting enough props for orchard use.

Seventy-five cents a tray for material in making 6-foot trays is some price!

The first consignment of Thompson Seedless grapes was despatched from Fresno on the 17th.

Thompson seedless were the first grapes to be shipped from Woodlake. These left last Monday, July 21.

The Texas crop of Elberta peaches is estimated at 1800 carloads. Early sales were reported to be bringing \$2.65 per bushel f. o. b.

A carload of Oregon cherries broke all previous records when 1,107 sixteen-pound packages put on sale in New York brought \$6,570.

A crop of sixty acres of Tokay grapes was sold by T. H. Peppers Co. of Lodi for \$14,000 last week. There are estimated to be 40,000 crates on the place.

The Russian thistle is practically under control in Merced county, owing to an energetic campaign against them by Arthur E. Beers, Horticultural Commissioner.

An eighty-acre prune and apricot ranch in the Santa Clara Valley will yield the owner \$40,000 for the season. Mr. Treadwell plans to dry most of the fruit.

Len Lindquist of Middletown (Lake county) claims to have invented a new method of making grape syrup from wine grapes. Regular winery equipment can be used.

A good pear crop in California and the West in general contrast with poor conditions in such important pear states as New York, Michigan, Illinois, New Jersey and Delaware.

Field mice have attacked young citrus trees in Yuba County, necessitating "bridge grafting" to save some of the trees. Poisoned barley has been recommended to kill the mice.

The fruit juice tax of 10 per cent on gross sales of grape, apple and loganberry juices is being protested at Washington, and a delegation is urging 2 cents a gallon or less as a tax.

Commercial packing houses will not want any more green prunes in dry yards than they can help this year. Tray shock and labor are too high. Evaporators will be busy though, and be used to at least half-dry the fruit.

Malaga grapes are ripening enough in the Lodi district so that the sugar in them meets the standardization law of 17 per cent. Not all of the bunches reach this, but it serves as a forecast of early ripening Tokays.

Modesto Canneries have been busy with apricots. Finishing them this week, their forces will be put on peaches. The Pratt-Low Co. of that city will have 200,000 cases of fruit up by October 15. Vegetable canning will follow until December 15.

The plum season closed this week at Porterville and vicinity. The fruit was of high quality, but the season was not as good as usual, prices being slightly lower than last year. Wicksons and prunes were the chief varieties marketed.

Perhaps you have envied the hogs who have had a jag on apricots. Twenty-five of a herd of 75 were fed on refuse from a cannery packing

apricots near Lodi. The refuse had fermented and these hogs were "soused" for four days.

A system of supervision whereby evasions of the standardization law will be impossible has been worked out by green fruit inspectors of Tulare, Kings and Fresno counties. There will be close co-operation and packing houses will be under close scrutiny.

The British Food Controller has extended a general license for importation of fresh fruits except grapes and pears, which are classed as luxuries. This will be welcome news to our apple growers, who developed a large trade with England before the war.

Sunsweet prunes and apricots will make their bow this year for the first time in many new markets. Hundreds of tons are already contracted for shipment to the Orient, to Russia, Australia, Canada, England, Holland, Belgium, France, Italy and the Scandinavian countries.

The commercial peach crop is estimated at 30,082,000 bushels this year; and a half, or 16,000,000 bushels, comes from California. Nearly 90 per cent of our crop is dried or sent to the canneries, leaving about 4,000 cars to be shipped as fresh fruit. Heretofore California has been the third peach state. Georgia leads us now.

TEMPERATURES FOR EVAPORATING PRUNES.

"The information now published on the subject of the proper temperatures for curing prunes and drying prunes is somewhat conflicting and appears to be more or less unreliable," said Professor W. V. Cruess of the University of California, in reply to our questions. "The whole subject of artificial drying of fruits would appear to be on a very empirical basis and that a great deal of scientific work must be done before accurate recommendations can be made."

"With our present knowledge, it would seem that we should recommend a temperature of 120 deg. F. to 130 deg. F. for the start of the evaporation of fresh prunes. Prunes that are one-half or two-thirds dry can be started at 140 deg. F. or 150 deg. F. Fresh prunes would at this temperature soften and drip. The prunes apparently will stand a temperature of 150 deg. F. when thoroughly dry, but our laboratory experiments indicate that a temperature of 160 deg. F. will cause considerable caramelization, even two hours after the prunes have become free of water. Thus it would seem that a temperature of 150 deg. F. should be about the maximum used in practice where there is danger of fruits being kept at this temperature for more than two or three hours after they are dry. Where the prunes still contain moisture the caramelization does not take place lower than 160 deg. F. or 170 deg. F. because the evaporation of the water from the fruit keeps the fruit below the danger point in the vaporator."

The use of suction fans operated at night with a pilot light for collecting moths and beetles has been reported. A flat pan with a little coal oil in the bottom constitutes the receiver.

How many cords of wood do you need for that prune dipper? Now is a good time to haul it.

LOSE NO TIME IN CLEANING THOSE MOLDY TRAYS.

(Written for Pacific Rural Press.)

Have you cleaned those moldy prune and raisin trays yet? In three weeks' time you will be wanting to use them. Washing trays takes time: "a lick and a promise" won't do; it is too risky. Everybody is scrubbing trays now or thinking about it. We called at one large commercial drying and packing establishment last week and the following is their method of washing their thousands of trays: They made a redwood vat 8 feet 4 inches long by 40 inches wide and two feet deep, with a steam coil at the bottom to keep the water boiling. A pound of lye is dropped in and one tray at a time is dipped and scrubbed. Hot water is necessary. That is a point that must not be forgotten. It facilitates the work if the trays are well wetted up before they go into the bath. Wire brushes are used on the real dirty trays, and all are well scrubbed with brooms. The wire brushes are 5 row with 2 to 2½-inch bristles. Three men clean about 250 trays a day. The water is changed about four times a day. The lumber for the vat costs about \$10. There is not time to lose.

Anderson Combination Dipper Perforator, Grader And Spreader

Send for Catalog of Packers' and Dryers' Machinery.

A practical machine that the prune growers of Santa Clara Valley (where it is made) and other prune-growing sections have learned to recognize as the standard machine of its kind. It embodies every possible advantage—and does the work perfectly in every way. Durable and substantial in construction.

MADE IN VARIOUS SIZES

We can furnish this Combination Dipper, Perforator, and Spreader in any size desired—for either hand or power use. Write—and tell us your requirements.

Have you enough trays to handle this year's crop? Shook is high-priced but so is the fruit you are growing. What has become of the disreputable old blanket stiff? No room in California today but for self-respecting workers.

The Longest Shipping Period

(Written for Pacific Rural Press.)

Newcastle (Placer county) and the district adjacent to it has perhaps the longest fruit shipping season on the coast—from the strawberry and cherry period in early spring to late pears, pomegranates, table grapes and persimmons when the air smells frosty, a few weeks before Christmas. J. A. Campbell, a Dominion Horticultural officer from New Zealand, was with us when we drove through this region last month. As we came into the fruit area around Roseville, Penryn, Auburn and Newcastle, Mr. Campbell exclaimed, "Ah, now this looks like home! These undulating hills, clothed with orchards to their summits are more like New Zealand than anything I have seen yet. The picturesque background of timber, range and brush is typical of California yet not unlike our island scenery in the distance. Our trees run a little larger than these, but not so large as those in your valley orchards. I like the way the trees are trimmed—low headed and well protected; carry a goodly load and are yet cheap to harvest the fruit from, also to prune and spray."

A Newcastle Orchard.

After visiting the packing houses we drove to the orchards of J. L. Nagle—a prominent grower and general manager of the California Fruit Exchange at Sacramento. This ranch, comprising 242 acres of orchard, ships fresh fruit from April to November. One or two striking new features were noticed here. Baskets are used to pick the fruit into instead of buckets or bags. The sides are springy slats; the handle is a rope and the fruit is taken directly to the packing house and packed out of the basket. "No

dumping into lugs. This obviates much bruising of fruit and it is handled only once. As the truck collects the filled baskets of fruit it drops empty ones in the row for the next picking; the trees being gone over about three times. The baskets nest so that a large load of empties can be carried and they are very light. A large variety of deciduous fruits is raised here. We found the men working on plums. One orchard of plums yielded a crate of fruit to the tree at four year old.

Cultural Methods.

A trained man is kept here whose sole duty it is to make his rounds and look after the health of the orchard; to investigate any trouble shown by individual trees and repair any mechanical injury or forestall it by precautionary measures. In irrigation, contour furrows are drawn as much as possible and about one inch of water used to every 6 acres. After irrigation, the ground is promptly cultivated as soon as it is fit to get onto with a team. Mr. Nagle manures heavily every year in addition to raising a cover crop. From the top of a knoll we could look down and see the difference in the color and density of the foliage on peaches, plums, pears, etc., where the manure had been applied and some adjoining orchards where none had been used.

Mr. Nagle supervises these orchards on his Saturday afternoons and Sundays, and has them contracted or departmental men in charge. As he says, "I am a fiend for cleaning up," and apparently the men in charge heed this. The packing and marketing facilities from this section are admirable.

Staples for Wiring Fruit Trees

In your issue of July 12th there was an article descriptive of a method of securing heavily laden fruit branches by means of wire and galvanized staples. I have always thought that anything driven into the limbs of the trees would injure them, or at least greatly weaken them. Am I mistaken? I have some pear trees seven years old and many of the branches are beginning to break in the high winds, but as I have to cultivate frequently on account of morning glory I have not put up any props. I had thought before of wiring up the branches, but was afraid to pass a wire around a branch as it might cut through the bark, but the idea of staples is new to me. How large should the staples be? If small ones are used for small branches they will be too small in a few years to hold up the greatly increased weight.—H. V. L., Oakland.

We have used wire for supporting trees for years in Napa and Sonoma counties to eliminate the expensive and awkward method of propping. To pass a wire or a wooden support behind the branch cuts through the bark and weakens the branch. We did most of our wiring in the winter, but it can be done any time. First

we used 14 gauge wire and found that too light—some of them broke. Twelve gauge is all right, but hard to handle, so we compromised finally on 13 gauge.

We used two-inch fence staples (light) and drove them in if possible slightly obliquely with the points tending downward to avoid a straight pull. I don't know that this is necessary as they hang on well and never pull out. If the wood is too small to carry a staple without splitting the wood—and this must be a matter of judgment—use large picture screw eyes. Neither of these will injure your trees, for the bark will grow right over and there is no wound.

I have noticed some orchards wired to a central strong ring, the wires radiating from it. This is a good plan in a few instances where there are a number of leaders, but is generally an unnecessary expense as it involves the expenditure of far more labor. It has this advantage; if one wire breaks, only one branch is released. You will find this method of wiring from staple to staple very helpful in securing your trees in shape, and it will obviate the expense and annoyance of props and broken limbs each year.

Figures on Apple Drying

To the Editor: Will you kindly answer the following questions:

- (1) Will Newtown Pippins dry out five to one average?
- (2) What is the cost of peeling and trimming per green ton?
- (3) What amount of sulphur is used in drying?
- (4) How many peeling machines would be necessary to operate a 50-ton crop and what is the cost of such machines?

(Reply by Carrol J. Rodgers of Watsonville.)

(1) I do not believe that orchard run Newtowns will dry out 5-1; but if of good size and well matured they should dry out about 6-1. The evaporators here figure from 6½-1 to 7-1 for the season's average of all apples dried—the bulk of these being inferior grades with more wastage.

(2) The labor cost for peeling will be in the neighborhood of \$2 to \$2.50 per green ton, depending on the kind of labor used and the quality of fruit. If trimming is practised after peeling the cost will be about this much additional or a total of from \$4 to \$5 per green ton.

(3) The amount of sulphur used varies from 20 to 40 pounds per dry ton, the average being perhaps 30 pounds. Early in the season the apples require more sulphur than later when they are more mature.

(4) The number of machines to use for a 50-ton crop depends on the speed with which you wish to dry and the amount of floor space available for drying. For economy in heat, it is desirable to use each unit of your plant to capacity, if possible. We figure 3½ to 4 tons of apples (before

peeling) for each kiln floor of 400 square feet. Each peeling machine will average about a ton a day or bet-

ter with expert operators. Power machines cost around \$40 each and hand machines about \$25 each.

Here and There in the Fruit Business

[Written for Pacific Rural Press.]

Dusting for Walnut Thrips—Results.

The J. B. Pico walnut orchard at Goleta (Santa Barbara County) was dusted with the kaolin-black leaf mixture just as the leaves were coming out this year. Two and a half months later the trees still showed freedom from aphids, and the trees carried good foliage clear to the top of the largest trees. Another orchard dusted two months later also showed freedom from thrips but the foliage in the tops of the trees showed small. The two orchards can be compared as they are adjacent and the soil is similar. We cannot say that these comparative conditions are due to the dusting or to different orchard management, but they are the facts.

Effective Whitewashes.

We noticed a very white wash on some two year old tree stems last week and reached down a hand to try its adhesive powers. It whitened the hand but did not brush off, so we asked the grower for his recipe. "Well, I use a lot of tallow in it," he said, "and I cook the lime while the tallow is stirred in—I put a fire under it. How much tallow—oh, I don't know, never weighed it, but quite a lump. It makes the wash stick and I think it is repellant to rabbits." The next day we saw another young orchard well protected with whitewash and the owner also uses a lot of tallow (no specific quantity) but he also adds a quantity of Spanish whiting in order to make white whiter. There was no scaling in either case.

Stable Manure for Citrus.

The Kaweah Lemon Company at Lemon Cove (Tulare County) started planting their citrus groves in 1890 and '91. They have over 160 acres in lemons—all Lisbons,—90 acres of navel oranges and some grape fruit—enough to run a good-sized packing establishment. J. R. Arthur, the manager, says that \$1835 was spent for barnyard manure in one year for a small 22-acre orchard which was bought to add to their holdings. He has more faith in manure than in any form of fertilizer because of its mechanical effect as well as its plant food value. The above is only quoted as an instance of the thoroughness of the application deemed necessary by commercial growers.

This is a Peach of a Year.

How to build a large peach orchard so as to never miss the target or to have too much to do at once is shown at the Superior Fruit Ranch at Ceres—320 acres of it. Their peaches are divided as follows: 40 acres of Muirs and 40 acres of Lovells now 10 years old; 40 acres of Tuscans and 40 of Phillips Clings (8 yrs. old); 20 acres of Albertas. Then there are 30 acres of Tilton Apricots and 10 of Blenheim, also 20 acres of Tokay Grapes and 50 acres of Malagas. This makes a long, profitable season. Any fruit man familiar with this section can figure out the possibilities of the turnover here for this year of wonderful crops and prices.

Disking Against Johnson-grass.

"The disk is not a good tool to fight Johnson-grass; I have found that out," said S. G. Owens of Madera, who has 80 acres of Muscats where this tiresome weed has crept in. "The disk just chops up the root and makes more plants of it which readily strike if the ground is in proper shape for working. I have found the best plan is to plow thoroughly and then use the spring tooth and harrow, which drags the tough roots up to the surface. Keep the spring tooth going till they are dried up and can be raked off. In the vineyard it is impossible to keep this going as long as I should like because the vines prevent that, but the spring tooth is the tool." He uses it also in his apricot and peach orchard to create and maintain a thorough mulch after irrigation.

Caprifying Adriatics.

Mr. Owens has about five acres of White Adriatic Figs which turned off

ten tons of dried fruit last year. This year he has caprified the orchard and can reasonably expect an improvement in quality and weight. He has 185 trees to be exact and these may yield \$700 to the acre with decent luck, for they are large trees. Farmers in this section are fortunate in being in control of their own water systems. The water is within easy lift of the surface and in any quantity. The soil is warm and responsive to careful treatment in irrigation and fertilization.

Prune Prices.

In 1902 prunes sold at a 2¼ cent base. In 1903 and 1904 they sold at 1¼ to 2¼ cent base and thousands of prune trees were ripped out by disheartened growers. In 1917 the growers received up to 8 cents and the following year 8½ cents and better. This year the market and the demand as well as concomitant conditions have given a 12 cent base. The average men outside of the associations sold their prunes at 9 cents. Some sold at 8 cents and 8½ and some at 10 and 11, but the average was not over 9 cents or 25% to 30% less than association men will get at the least.

Let Your Fruit See the Sun.

"I am going to take out every other row of prune trees in my orchard," said a prominent grower recently. "The trees have grown so close together here that the sun never penetrates and that is why these prunes are small. No sun—small prunes. I expect the surrounding trees to do better in size and quality of fruit and they will soon spread over the unoccupied ground."

That 300,000 Ton Raisin Crop.

Advertising is an art. Judicious display and a careful following up is bound to bring returns. Our growers' selling organizations are shining examples of what can be done by advertising in a large way, and this was only possible by organization. This year's 200,000 ton crop of raisins is already sold where a 100,000-ton crop was a drug on the market a few years ago. In a few more years there will be a 300,000 ton crop. Nothing but a grand campaign of advertising could find markets for such a vast increase. And this will be carried out by the efforts of the united growers of raisins—the California Associated Raisin Company.

Wage Scale Decision for 1919.

In accordance with a wage scale decision arrived at by conference with employers and employees, the following firms and fruit operators who are parties to the agreement agree to pay 45 cents an hour for 8 hours and 55 cents for each hour thereafter in each day: California Packing Corporation; Herbert Packing Co., Inc.; Garcia & Maggini Co.; Napa Fruit Co.; J. F. Pyle & Son; D. Di Fiore Packing Co.; Golden State Canneries; Pacific Coast Canning Co.; Geo. E. Hyde & Co.; J. C. Ainsley Packing Co.; California Peach Growers, Inc.; J. B. Inderrieden & Co.; Hunt Bros. Packing Co.; Pratt-Low Preserving Co.; The Shaw Family, Inc.; Salsina Packing & Canning Co.; Rosenberg Bros. & Co.; Croker Packing Co.; Schuckl & Co.; The Conatada Canning Co.; H. Z. Prince & Co.; California Canneries Co.; Manteca Canning Co.; Golden State Asparagus Co.; Bay Side Canning Co.; F. Z. Wool Packing Co.; Goetjen & Workman; J. H. Flickinger Co.; California Associated Raisin Co.; O. A. Nelson & Co.; Muller Bros.; Libby, McNeill & Libby; Pacific Coast Syrup Co.; Manteca Packing Co.; Richmond-Chase Co.; Guggenheim & Co.; G. W. Hume Co.; Greco Canning Co., Inc.; Winters Canning Co.; F. E. Booth & Co.; Ocean Shore Canning Co.; Maywood Packing Co.; Sunlet Fruit Co.; Sunical Packing Co.; Kings County Packing Co.; Zerillo Packing Co.; North Ontario Packing Co.; Placentia Canning Co.; San Jose Canning Co.; Tamal Packing Co.; California Co-operative Canneries; Western Canning Co.; Pasadena Canning Co.; Victory Canning & Packing Co., Inc.; Bishop & Co.

Belt a G-E Motor to it

Whether the job be one in the barn—milking, cutting the day's feed, pumping the water—or in the dairy—separating or churning—or wherever chores are everlastingly waiting to be done, there is a G-E FARM MOTOR that will do the work better and quicker. The labor released soon pays for the motor equipment.

(Written for Pacific Rural Press by E. E. Hodges.)

To the Ranchers of Madera County and Elsewhere:

The State Railroad Commission has investigated the situation in Madera county revealed in our issue of April 19, wherein it was stated that there is a general impression among the ranchers that if they buy an F pump, they will get earlier and more continuously satisfactory service from the San Joaquin Light and Power Corporation with less delays than if they buy any one of a half-dozen other pumps that are offered. In that issue we quoted the Power Company's representative who stated emphatically that there was no real basis for such an impression or rumor. Some of the Power Co. and F. Co. officials had ridiculed the statement that such an impression existed, but the Railroad Commission found it quite general among the ranchers as the Pacific Rural Press had found it.

The Railroad Commission then tabulated the dates when applications were signed and when transformers and meters were hung, the application dates including all from Madera county between January 1, 1918, and March 6, 1919. This shows that the average time between date of application for power and date transformers were hung was 132 days for parties installing F. pumps and 124 days for those installing other pumps. The average time between date of applications and date meters were ready for service was 145 days for parties who installed F. pumps and 143 days for all others. This proves that our readers actually were not discriminated against in any general way on account of the kind of pump they installed, although certain cases of discrimination are yet unexplained. Walter J. Dodge, Assistant Engineer of the California Railroad Commission, and Mr. Lutzke, also of the Commission, made the investigation.

On February 21, 1919, one of our subscribers wrote to the Pacific Rural Press stating that he had found a pump and motor that would fill his requirements and that the price was reasonable. He had partly paid for the outfit when his neighbors told him "that unless I purchase my plant from a certain company and purchase a certain make of machinery, I will meet all kinds of delays and obstacles, even to the condemnation of my whole outfit. After asking for bids from several firms, I asked this favored company. Their bid was \$71 higher than the next highest bid." * * Can anything be done to get a square chance for the farmer and justice for those who advertise in your paper?"

We asked the power company for their explanation, of course withholding the name of our subscriber who feared delay if he antagonized the company. We also inquired from five of the leading makers of pumps and motors in San Francisco, and found them unanimous in saying that their experience justified them in believing that such a condition existed. General Manager A. G. Wishon of the San Joaquin Power Corporation refused to discuss the anonymous letter, but almost immediately addressed a letter to his district agents asking them for specific cases of faulty installations of various pumps such as would justify the stand of the power corporation in recommending the F. pump to consumers of electricity for irrigation.

The Power Corporation has a definite set of specifications for pump installations which are required before it will connect its lines with the meter and thus with the pump outfit. But these specifications are not always followed by the local men who install pumps, and the ranchers have trouble afterward if connected in spite of the rule, but due to the urgency of some such cases.

Since Mr. Wishon would not go further in the matter, the Pacific Rural Press sent a representative to that territory and published a summary of his findings along with a few ranchers' statements in our issue of April 19. Not long afterward, we submitted our correspondence and several signed statements from the ranchers to the California Railroad Commission. That Commission thereupon sent their representatives to the same territory for an investigation, since the Power Company is under its jurisdiction and is supposed to connect power users in the order of priority in which their applications for power were signed.

Referring to actual dates of application and service, most discriminations against power users were found to have been for causes that would seem reasonable to any unprejudiced person. Some parties obtained transformers independently when the Power Company claimed to be unable to get enough to go around, and such

parties were served sooner than their turn would otherwise have justified. One party was told that the company had no transformers, but he found transformers available in San Francisco and was immediately connected up when he told the company about them. Some applicants were dropped from the priority list when they failed to answer letters. Some parties exchanged places with friends on the priority list for fair reasons and without delaying other applicants, but this is subject to abuse and is discouraged by the Commission. Some applicants were not ready when their turn arrived and the power men were busy elsewhere when they became ready. Sometimes a man late on the priority list could be connected with a great economy of time and labor while the power men were out to connect up a near neighbor. Such a practice would perhaps be commendable if it did not tend toward outrageous abuse and if it did not subject the company to perpetual suspicion.

But the persistence with which this public utility recommends one particular pump concern, and the frequency with which the representatives of both visit prospective power-users together, along with the discontent of other pump dealers have led to a suspicion, not well founded in our opinion, that some of the Power Company's representatives are getting a rakeoff from the F. pump business. The rumor that discrimination was practiced against buyers of other pumps certainly has led many ranchers to buy the one recommended by the Power Corporation officials. It may be significant that of the 141 applicants for power service who have been connected up since January 1, 1918, 80 have installed F. pumps and 61 applicants other makes.

I think that the Power Corporation has handled this situation somewhat unwisely, writes Mr. Dodge in his report, in that they have allowed various rumors to continue and have taken no definite steps to counteract them. Further, I believe that the close association of the Power and the F. pump companies' representatives is not the most prudent course to continue. * * * The Power Corporation recommends strongly the installation of the F. pump; and in their attempt to have these pumps installed, their representatives on going to see the applicant for service has * * * had an F. pump agent accompanying him.

However, it appears that during this year the order of connecting up new services in the Madera district has more nearly corresponded to the order in which the applications were received than during 1918.

Get Definite Data.

Our suggestion to our readers, based on the Power Corporation's stated wish to clear up such misunderstanding is that whenever you feel that discrimination is being practiced

against you, apply to the district representative of the Power Company on the basis of their statements in our article of April 19 and ask for an explanation. If that proves unsatisfactory, ask to see their books as the Madera representative promised permission. If you find discrimination that has damaged you, get the facts of the case which prove it and send them on to us or to the Railroad Commission in San Francisco.

THE KADOTA FIG PLANTINGS.

(Written for Pacific Rural Press.)

In reply to our enquiries regarding the Kadota fig (which is said to be the White Endich), W. Sam Clark of Sultana (Tulare county) said: "About the planting of Kadota figs for next season, I am now booking orders in some quantity about five months in advance of any previous season though my nursery has never heretofore been able to supply over 50 per cent of the orders placed with me (June 14). In a few days we will be picking and shipping the June crop and will be about 30 days at this work. On August 1 we will begin shipping the later crops, which correspond with the Smyrna and Adriatic. By caprifying this portion of the Kadotas we produce a dried article second only to the choicest Smyrnas. Then, as the season advances and the wasp is no longer obtainable, our figs continue to ripen and we generally cease picking November 15 to 19. Hence we have a crop in June, part of September, all of October and half of November, and we have harvested a tonnage on trees of a given age far greater than can be found on the above named varieties."

"The curing qualities are the same as any other fig. They are gathered from the ground in the same way though we consider them too valuable as a fresh fruit to think of drying them. For instance, all the green Kadotas in the valley around us have been contracted for by canners, who furnish the boxes. The grower gets 8 cents a pound f. o. b. for his June crop and 9 cents a pound for his following crops. The uncertainty of transportation the last two years has made us cautious of heavy shipments, but another year we hope to resume in quantity the shipping East."

"It is not alone the excellent shipping qualities of this fig that is bringing it into favor with planters. It bears a paying crop at an early age, the fruit never splits, sours, or molds on the tree and is frost resistant."

Cherries are practically all harvested now and the yield has been satisfactory in tonnage and of a quality throughout which has never been surpassed.

Suggestive Agricultural Mention

(Written for Pacific Rural Press.)

Restricted Cereal Importations.

After August 15 no seed or paddy rice may be imported into America, nor, except under strict supervision may raw, uncleaned, or unprocessed wheat, oats, or rye be imported from Australia, Japan, India, Brazil or western Europe. This is to prevent introduction of the flag smut and take-all diseases.

Chinese Wheat and Flour.

China imported more than one and three-quarter million barrels of flour in 1913, but her imports have fallen off since then and she now produces more wheat than she uses at home. Had it not been for high freight rates, flour milled in Shanghai would last year have been marketed in Vancouver. That's surely carrying coals to Newcastle!

California Land Show.

A cotton gin, a vegetable dehydration plant, a miniature rice field and rice mill are some of the exhibits to be at the California Industries and Land Show, October 4 to 19 in San Francisco. Along with these will be maps from the U. S. Department of Agriculture showing further available lands for cotton, rice, vegetables, etc.

World Cotton Conference.

A world cotton conference at which are expected representatives of not less than 20 foreign countries, besides all of the cotton states of America, is to be held in New Orleans, October 13 to 16. The pro-

gram recently published includes discussion of all the questions confronting cotton growers as well as a better understanding by each section of the conditions existing in other sections.

Lime for Legumes for Fertilizers.

Is your land heavy and sour? Money spent for lime is an investment, not an expense. It will all come back with some more little dollars besides. Soils analyzing strong in lime will produce abundant legume crops, other things being favorable: legumes increase the nitrogen in soil; nitrogen from legumes will increase your crop of whatever kind; and the lime will help in other ways, too.

Barley Skyrocketing.

It is estimated that over half of the present barley crop has been sold, and Europe is demanding more barley at the higher prices being asked. Since the opening of shipments to Europe, there has been a rather steady rise in prices due to increasing demand. It may be well not to forget recent history of a similar wild struggle to get barley and a slump thereafter.

Cold Storage Public Utility.

All cold storage warehouses are public utilities subject to the Railroad Commission as to rates, regulations, etc., under a law which went into effect July 22. There are about 60 such warehouses in California. The Railroad Commission has asked

all of them to file schedules showing all rates, charges and rules at present in force. From these reports as a basis, equitable rules and charges for the State will be worked out officially.

Iron Canyon Water Application In.

Permission to store a million acre feet of water per annum besides direct diversion of enough to cover an acre every 17 seconds is asked of the State Water Commission by W. A. Beard of the Sacramento Valley Development Association to irrigate 650,000 acres on the west side of the valley from the Iron Canyon project. Mr. Beard also asked the use of 10,000 cubic feet per second for hydro-electric power development under the new law by which irrigation districts may generate electricity with their water power.

Modesto Applies for Water.

The Modesto Irrigation District has applied to the State Water Commission for a permit to store 600,000 acre feet of water per annum in the Tuolumne River by means of a concrete dam 283 feet high, 930 feet long on top, 100 feet long at the bottom, the waters to be used for electric power and for irrigation of 100,000 acres as reported by the Water Commission. The dam and reservoir are to cost \$3,100,000 and the electric works are to cost \$1,000,000. The work is to begin in 1920 and be finished before 1924. This district has been dry several weeks already this summer, and the need for storage is shown by damage to fall crops.

Hogs Prevent Irrigation.

A dollar a foot for a ditch right of way to irrigate new developments in Placer County proved too much for the P. G. & E., which company had been allowed by the Railroad Com-

mission \$15,000 with which to buy 47,200 feet of right of way. One hog asked \$9,200 for five or six acres of uncleared land worth a maximum of \$80 per acre. Such unreasonableness on the part of some farmers prevented others from getting water after the P. G. & E. had bought 18,600 feet of right of way for \$19,000. The farmers who suffered tried to get the Railroad Commission to order completion of the job and delivery of water. The commission refused to feed the hogs (by ordering completion of the canals), but suggested that their appetites be reduced first, by pressure from their neighbors who want water.

WHAT DO YOU KNOW ABOUT THIS?

A business man who had become a prune grower was told by an independent buyer, just when he was going to lose money by letting his fruit remain in the Prune and Apricot Growers' Association, and offered him 8½ cents for his crop back in April—just to help him out of a hole. The grower is said to have appealed to the Association to have his contract cancelled so as to be able to get this grand price, which request was naturally refused. He is now able to realize how important it is for every single member of a marketing organization to "stay put." It looks as though the man who remains on the outside now is something like those men who evolve a "system" to beat the races. But the only way they can ever win is to take a flyer and quit after grabbing off a long shot. This year the odds were too wild for anyone to take a chance and win. But the bookmaker has got to live, and he can only live on what he makes from you fellows who speculate.

CUT YOUR MACHINERY EXPENSE

The belting with which you equip your machinery can be the largest item of your running expense. If you continue to use the ordinary makeshift kind you can expect a continuation of the usual breakdowns and lay-offs. The belt that will give you less trouble and last longer is the one that will save you money, time and labor, and prove the most valuable in the end.

That belt is the **TEST SPECIAL**. For years it has been recognized as the standard and has won its popularity through its merits and superior wearing qualities. It is a guaranteed belt for hard service. No matter how great the strain or what the weather conditions may be a **TEST SPECIAL** will do the work as though the conditions were the most favorable.

TEST SPECIAL is made of long fibre cotton, specially woven into strong plies. Each ply is vulcanized with high-grade Rubber Friction. High pressure is maintained during the process of vulcanization, which forces the rubber through as well as between the plies. This assures a permanent adhesion. **TEST SPECIAL** will positively never separate between plies.

We guarantee it to give better and longer service than any other Rubber Belt manufactured. Our guarantee is your protection. Do not purchase Belting for any purpose whatsoever until you have investigated the **TEST SPECIAL**. It means a saving to you. Send in the coupon for samples of the grade belt we will guarantee for your work.

If you are having belt trouble of any description, write us. Give us the details and a rough drawing, showing location of machinery and trouble, if possible, and we will tell you what is wrong. Nine times out of ten belt trouble is due to its improper use. Write us today. Our services are free.

Grasses Along the California Coast

(Written for Pacific Rural Press by Sam'l E. Watson.)

At the first convention of the California Dairy Association, in 1894, Prof. E. J. Wickson gave a talk on grasses, in which he specially commended the perennial grass, *Danthonia Californica*. In the Rural Press, about the same time, a correspondent from Marin county also gave it the following tribute, when there was considerable discussion as to grasses suited for dry regions:

"In the search for pasture grasses that will endure drouth why do they not cultivate *Danthonia Californica*? It is the most valuable pasture grass that we have in this county, but unhappily it can hardly produce seed, because the animals eat it so greedily. Last fall, when there was not rain enough until after Thanksgiving to start seeds, *Danthonia* grew and flourished, and helped by the fogs and mists on the high hills, it was the mainstay of the animals. It keeps green longer than anything else in the spring, freshening with every shower, and I have no doubt it could be converted into a lawn grass. I have seen beautiful, smooth stretches of it when conditions were favorable and when conditions are unfavorable it makes the bravest struggle of any plant I know."

These statements impressed me so that I have tried to observe it in my work along the coast and have found it generally distributed from Bolinas to Russian river and inland as far as the ocean influences permit enough permanent moisture to continue growth after the common annual grasses have turned brown.

Pastures Along the Ocean.

It is certainly true that through the centuries rank growth of vegetation, due to ocean influence, has filled the soil with humus or decayed roots and herbage. This gives it moisture-holding qualities through the dry seasons, and this fact has a direct bearing on the great problem of maintaining the pastures along the ocean.

It is a question of relying on perennial growths that send roots down to permanent moisture and the direct problem is to find grasses and forage plants with abundant leafage and minimum seed-stems, such as the bunch grasses of perennial type. Blue-grass of the middle states, buffalo-grass of the western ranges, and *Danthonia* of the Pacific Slope may be relied upon as the mainstay of dairy pasturage.

Prof. Jepson's "Flora of Western Middle California," with its section on the "Grass Family," edited by J. Burtt Davy, which has enabled me to identify many of our common grasses, says that *Danthonia* is the prevalent grass on dry hills, especially along the coast from San Francisco Bay northward and southward.

Prof. Geo. H. Vasey, while botanist of the U. S. in 1893, in his work on "Grasses of the Pacific Coast," says it extends from middle California northward and also eastward to Nevada and beyond.

The Mainstay of the Dairyman.

The practical dairyman along the ocean knows that there is a bunch-grass which is the mainstay of his herds, but gives little notice to its habits and has never heard of Etienne Danthoine, a French botanist of the 18th century, in whose honor the great perennial was named. Excepting for a mass of fine green blades close to the ground and a few seed-stems, as it has escaped the eager nipping where a maximum herd of dairy cows is cropping it twelve months in the year, the casual observer will scarcely notice this inconspicuous grass, that maintains its hold through the centuries.

In the Australian building, at the Panama-Pacific Exposition, *Danthonia* was displayed in several species peculiar to that country, indicating that it is important on that continent, similar in climate to California. The one deficiency of the grass is that it is a shy bearer of seed and therefore difficult of introduction and propagation. However, dairymen along the region facing the Pacific need not

worry as to this shortcoming, as it was here long before themselves and will continue in the centuries to come.

In reply to any question as to how we may improve the coast pastures, there is but one answer, and that is to make conditions as favorable as possible to this great perennial; investigate its habits and aid in combatting the foreign growths that have lessened its importance and crowded it out, with the assistance of overstocked ranges. At least the dairyman should be able to identify it and cultivate the habit of understanding something about the qualities of the various plants that cover his dairy ranch, thereby lending a helping hand as it may be required.

In order to aid in this identification I have made a collection of the grasses in this vicinity, most of which are annuals and compared with the perennials of little value as pasture plants. These may be classified into three tribes, as follows:

Oats Tribe.

Danthonia, or Oat-grass; Wild oats (*Avena fatua*); Mesquit or Velvet grass (*Holcus lanatus*).

Barley Tribe.

Barley-grass or foxtail (*Hordeum murinum*). Meadow Barley-grass (*H. nodosum*). English Ray-grass (*Lolium perenne*), a perennial, commonly used for lawns in all places, probably valuable for bottom pastures. Italian Rye-grass (*L. multiflorum*), an annual or biennial, extensively sown in bottom lands of Humboldt county for summer feed. Darnel or cheat, (*L. temulentum*), common in grain fields and probably a good grass in its early stages. Various considered as toxic. English farmers believing it harmful if brewed with barley. Most recent opinion is that it is sometimes affected with ergot, a black fungus, poisonous if eaten. Rancheria-grass (*Elymus condensatus*), a good grass but not very prevalent in this vicinity.

Fescue Tribe.

Branch-grass (*Bromus maximus*), useful in early stages, but its terrible awns make it useless when mature, though in regions of California, where better grasses are deficient, it is used extensively for dry stock. Poverty-grass or soft chess (*B. hordaceus*). Common everywhere in California and apparently of little value when mature, though it is highly praised by a prominent farmer in Humboldt county. (*B. cardinatus*) not plentiful here, but increasing farther north and regarded by the same Humboldt farmer as well-suited for dry land and a good pasture grass, as it is a perennial. Rattlesnake-grass (*Briza maxima*), an ornamental grass in gardens. Weedy Fescue (*Festuca myuros*). *Dactylis glomerata* (Orchard grass), perennial, affording good pasture.

As most of these are annuals and do not prevail in the coast pastures they have but little interest to dairymen along the coast, but at twenty to fifty miles inland they are the important range grasses and some of them constitute the winter pasture, turning brown and dry, with seed-stems from one to six feet high. In these semi-arid districts the perennials do not thrive, usually, though the rye-grasses continue green long after the annuals have dried up and become woody.

Miscellaneous Growths.

In such favorable regions as on the coast ranges it is to be expected that there is great variety in plant-life, but the fact that perennials have taken the ground and survive the long summer period, where annuals do not penetrate to moisture, gives the former class of plants an advantage. While there is considerable wild clover (*Trifolium tridentatum*), mixed in the pastures and a weedy fescue (*Festuca myuros*) is becoming a serious competitor with *Danthonia*, though apparently cropped by cattle, the great problem for ranch owners is to make an effort to destroy such

unpalatable and harmful plants as the sedges, lupines, and especially the English plantain (*Plantago lanceolata*) or ribwort, which is rapidly covering the best pasture lands. In reference to this invader, Prof. Jepson states that it is a naturalized Euro-

pean species, which has seriously diminished the carrying capacity of cattle pastures in the Point Reyes country and northward to Humboldt county. These various growths should bring a full discussion here and later investigation as to practical efforts to redeem the coast pastures from all injurious plants.

WORLD WHEAT CONDITIONS.

If the world supply of wheat has any bearing on its market value, figures just gathered by the U. S. Bureau of Markets will prove interesting. The average world production for the three years, 1911-13, preceding the world war, was 3,825,096,000 bushels. 1918 crop totaled 3,788,926,000 bushels. The United States produced more than any other country—about one-fourth of the world's production. Russia and Siberia together raised about 200,000,000 bushels less than the United States, and the next biggest producer, India, raised only half as much as Russia. From the 1919 crop, however, Russia will be able to furnish the world with practically none as against her pre-war average of 128,000,000 bushels. India, instead of exporting 35,000,000 bushels, as she did in 1918, or 60,000,000, as she did annually in the pre-war period, is importing wheat from Australia, owing to her crop failure. The only exporting countries for the period July, 1919, to June, 1920, are Argentina, Australia, Canada, Algeria, and the United States, but they have an estimated total of 1,287,807,000 bushels for export to the rest of the world which does not feed itself.

FARMERS MAY KILL BAD BIRDS.

In answer to inquiries as to the farmers' right to kill birds which are actually injuring his crops, we give below an extract from the law which shows that the farmer is allowed to protect his crops:

"All other species of wild birds, either resident or migratory, shall be considered non-game birds; provided, that the English or European house-sparrow, the great horned owl, sharp-shinned hawk, Cooper's hawk, duck hawk, butcher bird, blue jay, house finch, commonly known as the California linnet, are not included among the birds protected by this act; and provided, further, that in fish and game district one, in fish and game district two, and fish and game district three the blackbird is not included among the birds protected by this act; provided, further, that nothing in this section shall prohibit the killing of a robin, or other wild bird by the owner or tenant of any premises where such bird is found destroying berries, fruit or crops growing on such premises, but the birds so killed shall not be shipped or sold."

FARM OWNERS' AND OPERATORS' NATIONAL ASSOCIATION.

One of the staff of the Farm Owners' and Operators' Association has been in the office of the U. S. Grain Corporation studying the latest and official methods of grading and classifying grain. Every courtesy and aid was received from the officials. His office will be at the association headquarters, Farmers' and Merchants' Bank Building, Stockton. Although the grading done by the association grader will not be "official," farmers say it will be a great satisfaction to have a test made before they offer their wheat in the market. The service will be free to members, but a charge will be made on samples graded for non-members. Equipment for a complete grader has been ordered and will soon be installed. Chairman Albert Lindley has still other plans for extension of the work. Vice-chairman J. M. Bigger and all the directors are giving their enthusiastic support.

Hessian fly has been found in some of the coast county wheat fields, not doing a great deal of damage so far as we have heard. The chief item in its control is to burn the stubble or plow it under as early as possible. Stubble burning should be done under instructions from the local or State Fire Wardens.

These resilient rubber rivets mean greater mileage.

Grow Wheat in Western Canada

One Crop Often Pays for the Land

Western Canada offers the greatest advantages to home seekers. Large profits are assured. You can buy on easy payment terms.

Fertile Land at \$15 to \$30 per Acre—

land similar to that which through many years has averaged from 20 to 45 bushels of wheat to the acre. Hundreds of cases are on record where in Western Canada a single crop has paid the cost of land and production. The Governments of the Dominion and Provinces of Manitoba, Saskatchewan and Alberta want the farmer to prosper, and extend every possible encouragement and help to Grain Growing and Stock Raising.

Though Western Canada offers land at such low figures, the high prices of grain, cattle, sheep and hogs will remain.

Loans for the purchase of stock may be had at low interest; there are good shipping facilities; best of markets; free schools; churches; splendid climate; low taxation (none on improvements); For particulars as to location of lands for sale, maps, illustrated literature, reduced railway rates, etc., apply to Supt. of Immigration, Ottawa, Can., or

Some Types of Air-blast Evaporators

(Written for Pacific Rural Press by Professor M. V. Cruess, Univ. of California.)

Most of the large evaporators in California are of this type. They are used for a wide range of materials and products from fish and laundry to rain damaged prunes and raisins. The design and construction of these evaporators are practically never alike in two cases. Some are of excellent design, especially those used for fish; others are very inefficient and of improper design. Many of those used for prunes, I am sorry to say, ignore most of the fundamental principles of evaporation and consequently give very poor results.

In planning any style of evaporator, several fundamental principles must be considered:

1. There must be an adequate supply of heat.

Heat is the sole cause of evaporation. Every pound of water evaporated requires about 1000 British Thermal Units, or about ten times the amount of heat to raise one pound of water from the freezing point to the boiling point. The burning of one pound of oil liberates about 18,000 B. T. U. But we can count on not more than fifty per cent. of the heat liberated being actually used. For example, if air at 80 degrees F. is raised to 150 degrees F., artificially, and is blown over the fruit and leaves the dryer at 120 degrees F., about 57 per cent is lost in the air leaving the evaporator. It is usually estimated that only about 40 per cent of heat generated is actually utilized.

2. The Humidity.

The humidity of the air in the evaporator is very important. Humidity means the amount of moisture in the air—100 per cent in humidity means air saturated with water vapor at a given temperature; 50 per cent relative humidity means air with only 50 per cent enough moisture to saturate it. In practice, it is not advisable to completely saturate the air before leaving the evaporator; this would too greatly slow up drying.

On the other hand, the air must not be allowed to leave the drier without absorbing a reasonable amount of moisture. We have found many evaporators that have no provision made for the regular escape of the saturated air. It is blown through the evaporator over and over and the air finally becomes "dripping wet" actually, and deposits water on the fruit at the end of the tunnel remote from the fan. The wet air must be removed.

3. Ample flow of air is essential.

Do not choose too small a fan or too small a ventilator and also be sure that your heating system is large enough for the air supply. An improperly balance fan and heating system will cause much exasperation, loss of temper, and what is worse, loss of fruit.

Sixty-nine thousand cubic feet of air at 212 degrees F. falling 1 degree F. is necessary to evaporate one pound of water. Each 27 degree F. rise in temperature doubles the moistures absorbing power of the air. Thus air at 150 degrees F. will absorb twice as much moisture as air at 123 degrees F. and so on for the other temperatures.

4. Good ventilation.

For removal of the exhausted air is essential. Not only must the air flow rapidly in the evaporator but it must also be removed and not allowed to "back up" or to recirculate. Get it out of the evaporator's system as soon as possible once its work is done.

5. Do not make the evaporator too long.

For your fan and heating system. The last half of a long drying tunnel may often serve as a depositing place for excess moisture from the air passing through. The fruit may actually "sweat" under such a condition, indicating a deposition of moisture. Two drying tunnels, 40 feet long, represent in the writer's opinion all of the space that a 60 inch disc fan should be asked to take care of.

6. Other important considerations.

Are the following: The arrangement of the evaporator should be such that the temperature may be controlled closely. Several good thermometers should be arranged in the evaporator, a recording thermometer at the entrance being very desirable. Make the air pass over your trays and not down wide channels between the stacks. The writer has seen a space of two feet between two lines of loaded cars in a drying tunnel. The air naturally followed down this wide channel and escaped through the ventilator without doing any work. A screen tray is much more satisfactory and efficient than a wooden tray. By all means, use screen trays if they can possibly be afforded. Wooden trays permit drying on one side only and use up great quantities of heat.

PRUNE DRIERS AND DRYING.

(Written for Pacific Rural Press.)

Nineteen years ago Anderson combination prune dips and graders were sold in 17 counties of California; and over 100 per year of the same type are being sold now, according to the inventor, W. C. Anderson himself. This season a great many people are coming to Anderson-Barngrover and saying that they had their prunes dried by neighbors last season but want an outfit of their own this year. Such outfits are made in five different sizes, so that anyone with ten acres of prunes or more may profitably use one. They are made in standardized parts so that a man with young trees bearing uniform-sized prunes may get a furnace and dipper to use on the first few crops and add the grader and spreader later.

Perforators Better Than Lye.

Needle perforators are necessary for all prunes, according to Mr. Anderson, who has been drying fruit of his own for 25 years. Prunes shaken from the tree will check by use of lye, especially around the stem end and particularly with Imperials, but he says that when they are old enough to drop, even in the Santa Clara Valley (where they do not cling to the trees so long as in some other districts), lye alone does not check them properly for a satisfactory job of drying. Lye in the prune dip is properly used only to remove the bloom and waxy covering of the skin. Then running the fruit over a perforator makes minute openings to permit proper evaporation of moisture. Prunes not perforated but put out in hot weather may ooze from the stem end if no other rupture in the skin is provided. The ideal way is to use weak lye, say a pound per 100 gallons, replace it with entirely clear water and new lye every day, and perforate the prunes. Mr. Anderson takes the cloth off the perforator needles every 20 minutes to clean them. He also does not believe in rinsing after dipping in weak lye as all the lye will disappear in the drying. But no excuse is to be tolerated for the use of the same muddy water day after day; and where strong lye is used, there is need of rinsing.

Get Big Crops With Less Effort

The long levers on Disc Harrows make gang shifting easy. Not only is handling easier but the work is better. The E-B Disc Harrow is quickly and easily adjusted and has great flexibility and increased penetration. This insures thorough pulverization of the soil, better seed bed, larger yield.

E-B Disc Harrows

The E-B Disc Harrow is a modern necessity for the man who wants big results and all the crop profits he's entitled to. Powerful and dependable, this disc harrow will give you years of satisfactory service. Have your dealer give you full details of this harrow.

Agricultural Notes.

Corn is showing splendid growth in the Vina district of Tehama county.

Hay was selling in England at the equivalent of \$38 to \$48 per ton about June 1.

The United Kingdom was the destination of over a million bushels of rye shipped out of New York in the week ending June 14.

Nearly 8,000,000 pounds of barley malt were exported from New York city to the Netherlands during the week ending June 14.

Irrigated crops around Los Molinos are normal owing to abundance of irrigation water; non-irrigated areas averaged two-thirds of a crop or less.

The Exeter district is shipping cantaloupes on a commercial scale for the first time this year. Seventy-five cars is the estimated crop.

Rice irrigation water drains onto an alfalfa patch and thence into a ditch and onto other rice lower down as arranged by S. M. Joslin of Placer county.

An exportable surplus of more than 2,000,000 tons of grain had accumulated in Siberia, as reported January 31, 1919, by the American consul at Vladivostok.

Lodi shipped the first carload of tomatoes this season. The car left last Saturday for Eastern consignees. Packers have made preparation for a bumper crop in the State.

Eastern shipments of watermelons totaled 2,800 cars last week. Dinuba, Turlock and Imperial Valley were the most active districts. The shipment of prime fruit is starting now.

The first carload of cantaloupes shipped from Turlock this season brought \$4.25 for standard crates in Portland, Ore. Over a hundred cars daily are now being shipped from the Turlock district.

Cantaloupes in Stanislaus county have been affected by mosaic, a disease common in sugar beets. Plant pathologists from the State Horticultural Commission and University of California are working on the disease.

Dr. Elwood Mead of the University of California has been asked to prepare the sections dealing with farm credits, in the proposed law for bank credits on short time for farmers and industrial workers. The committee on this work was formed in New York.

Bean movement to the warehouses of Stockton and San Francisco during June was 27,765 sacks more than were moved out. A total of 101,518 sacks were received at San Francisco. There were over 2,000,000 sacks of beans in the State June 1. There were 317,493,000 pounds of beans in the United States June 1.

California bean acreage is estimated to be 415,000 acres, a decrease from the 1918 acreage of 597,000. The difficulty of marketing is the main cause of this decrease. Los Angeles, Orange, Ventura, and Santa Barbara counties, with half of the State's bean acreage last year, planted 85 per cent of the 1918 acreage.

All stocks of Merced tomatoes were condemned in San Francisco wholesale commission markets this week as a result of irregular grading. The Deputy County Horticultural Commissioner is holding the tomatoes as evidence and the packers may be prosecuted. With effective laws fraud in fruits and vegetables will be reduced to a minimum.

Lima beans from last year's hold-over have been recleaned and will be held in stock in view of the short crop this year, by the lima bean selling agency. Secretary Essig estimates this year's crop at 50 per cent of normal, and he expects the thirty cars of limas and thirty cars of baby limas held by the agency to bring more than the current nine cents a pound.

Leases on 10,000 acres of land are to be obtained for a big rice project in Sutter county. Six thousand acres are already provisionally contracted for, and it is reported that this land

will be leased for a three-year term to Japanese, who will pay \$32 an acre per year for it. Water for irrigation will come from the Sutter-Butte Canal Company if the project goes through.

The baled hay law went into effect July 22. The law establishes 2,000 pounds net weight as the standard ton of hay and provides for the marking with a tag the true weight of each bale. It prohibits the malicious breaking of bales and provides for settlement when bales are broken. The addition of foreign matter is prohibited. The law will be strictly enforced.

COMPLETE TRACTOR CATALOG.

A most valuable feature of the State Fair tractor exhibit, from the standpoint of tractor users, is to be the catalog of all makes, showing in detail and in condensed form the size, specifications, and equipment of each machine. Questionnaires have been sent out by Geo. Collins of the Cali-

fornia Tractor and Implement Association State Fair committee including 66 questions about each machine. This will be a great reference book, suggesting many points that a buyer of tractors should look into and can see at the State Fair.

The first fig trees were introduced into California probably in 1769 when the first Catholic Mission was founded in San Diego. The Mission fig grows all over the State practically and still holds its popularity as a producer.

Mechanical Power on the Farm

Users of tractors, engines, pumping plants, motor trucks, automobiles, electric motors, and other mechanical farm power are invited to make this department an exchange of their experiences and troubles.

NEEDED BIGGER TRACTOR.

"My 12-20 h. p. tractor did splendid service, but I want a 20-35 machine of the same kind now, because I figure I can do twice as much work with it in about the same time," said I. N. Miller of San Joaquin county. "I bought the 12-20 for my own use on 250 acres, but so many folks around me wanted the use of it that I plowed 1300 acres of grain and orchard land last winter and spring. Part of that was Bermuda sod. After plowing it I angled a seven-foot double-disk as much as possible and worked it down. Part of the plowing was done with 50 inches of plows going ten inches deep.

Planked Out of Mud Hole.

"I bogged down once in a mud hole. All that was necessary was to put a plank under the front end of one track, brake the track on the other side and throw the engine into gear. This brought the plank back under that side and then the same thing was done on the other side. Then with both tracks in gear, the machine pulled out easy enough."

TRACTORS CULTIVATE HILLSIDE ORCHARDS.

Tire pumps were required on the fuel tanks of two 20-35 tractors to force fuel into the carburetors on the steep hillsides included in 950 acres of young almond trees which were saved from drying out by the tractors this summer. Lack of rain made lots of cultivation necessary to save the trees, but horses and men were scarce. The Associated Almond Growers of Paso Robles ordered one tractor on the guarantee that it could negotiate 75 per cent of the hillsides. Within a month they ordered another. Manager G. A. Nehrhood is enthusiastic about the work done by these tractors with ten-foot double disks and twelve-foot spring-tooth harrows, which cultivated practically the whole orchard. Part of it was cultivated as many as five times.

THE SONG OF THE ENGINE.

(By G. W. Morrison.)

One listens in the dark more intently to the rhythm of the engine, then learns its language. The story the engine is telling all the time is of moderation in all things. "Give me food and drink in moderation; don't choke me. Give me good digestion so I may thoroughly consume my food, which is gas-mixture, and show my best power. Do not give me over-rich doses of gasoline and a weak and vacillating battery spark that will choke me up with carbon and make me sluggish and panting when I have to run up over the hills, but give me less gas, more air, and a big, fat magneto spark of the hottest kind that will keep my cylinders clean and make me take the hills as mere play. Then I will 'purr' in my happiness, and from sheer joy will sing you songs of love and devotion, giving such good service you can truthfully tell all scoffers that I run sweeter, not only at night, but all the time, because my magneto gives me the vitality of life and the 'pep' of will-iness and joy."

ELECTRIC SHORTAGE COMING.

There is going to be a shortage of electric power about as serious this year as last in Central and Northern California, according to Power Administrator H. G. Butler of the Railroad Commission. The larger steam plants of the power companies were already in operation early in July and the smaller plants were being put into condition to operate as water flow decreases. The amount of electricity to be generated is six or eight per cent greater than last year with no prospect of reduced demand or of early rains which helped out last year. The winter snows came too late to keep

the water power up, and though more water was stored this season than last, the power companies have had to draw on it two weeks earlier than last year. Were it not for the completion of the line in Sacramento canyon which last winter connected central California with the dynamos of the California-Oregon Power Co. and added about 7,000 horsepower to our electric resources, the new steam turbine of about 20,000 horsepower capacity being installed by the Pacific Gas & Electric Co. would be the only hope for keeping up with the demand. It is necessary but unfortunate, that in proportion as reduced water flow reduces hydro-electric generation, to about the same extent is irrigation reduced and therefore the demand for power for pumping increased. No conservation orders such as were put into effect last summer are contemplated. If any rancher loses one crop of alfalfa hay from 40 acres, he will have lost more money than would have paid interest on investment in a gas engine plus the cost of gasoline to run it plus the cost of the engine itself.

AFTER LONG IDLENESS OF ENGINE.

After a gas engine of any kind has long stood idle its film of oil between the pistons and cylinder walls has caked, and perhaps sweating has rusted the walls. It must be run some time before its splash oil system or even a force-feed oil system will get the proper lubrication between piston and cylinder walls. Meanwhile there will probably be too much friction, heating, scraping of

metal, and loss of power. To avoid this, it is recommended that before starting the engine, its spark plugs be removed and half a cup of lubricating oil put on each piston. Turn the engine over rapidly by hand until the walls should be lubricated, replace the plugs and run the engine idle under its own power slowly for five minutes.

GUNSHOTS FROM AUTOMOBILE.

Time was, when the writer hurriedly turned out of bed around midnight and sought the tragedy supposed to have resulted from several sharp gunshots. He has been awakened many times since by the same noise, but it does not worry him now.

An exuberant auto driver going at high speed suddenly shuts off his spark and advances it again. A charge of gas goes through the firing chamber and into the exhaust without ignition by the slow spark. The advanced spark ignites the next charge and its exhaust explodes the live gas in the muffler.

DONE BY A SMALL TRACTOR.

A nine-eighths tractor, pulling three ten-inch plows, turned 15 acres in good shape for Theodore Stirewalt of Tehama county in 22 hours. It pulled an eight-foot double-disk angled to the limit and weighted down for hard rough ground. It ran a hay press all day when the temperature

TRACTORS—TRUCKS—FARM MACHINERY

219 N. Los Angeles St.,

Los Angeles, Cal.

Why the Cletrac TANK-TYPE TRACTOR Best Meets Your Needs

THIS thirty-two page illustrated booklet is of vital interest to every farmer in the United States. It answers the questions you have been asking. It solves the problems you have been wrestling with. It gives you just the kind of information about tractors and tractor farming that you have been looking for. Sent free to any one. Mail the coupon today for your copy.

The Cletrac is a "year round" tractor

We believe that we can conclusively demonstrate to the average farmer that he can get more work out of the Cletrac more days in the year than out of any other tractor on the market. The Cletrac is invaluable in winter as well as in summer. It pays you dividends in the fall as well as in the spring. It is a "year round" machine. Send for the booklet shown above. It will open your eyes to the tremendous possibilities of tractor farming with a machine that serves you twelve months in the year.

The Cletrac has a wider range of use

It is small enough to be used economically on light jobs, yet powerful enough to handle the majority of the so-called heavy work about the farm. It plows, harrows, plants, reaps, binds, threshes, hauls, cuts ensilage, fills silos, saws wood, and does practically all the work formerly done by animal and stationary power.

The Cletrac is built to stand hard usage

It is rugged—and powerful. It is designed and built by practical men who know what a farm tractor must stand. It is economical in its use of kerosene and oil.

Don't wait! Get your Cletrac now

Orders are coming in fast and we are filling them as rapidly as we can. In another month we will be behind again. If you want your Cletrac promptly order it now—today! Don't wait! Every day's delay means a later start in reaping the greater profits that are bound to come with year round Cletrac farming.

Send for this booklet "Selecting Your Tractor." It goes into your problems—and solves them. It doesn't do a lot of theorizing but gets right down to cold hard facts that are of real live interest to every progressive farmer. Fill out this coupon now—and mail it today.

The largest producers of tank-type tractors in the world.

The Cleveland Tractor Co.

19079 Euclid Avenue, Cleveland, Ohio

CLEVELAND TRACTOR COMPANY

Please send me your thirty-two page illustrated booklet "Selecting Your Tractor."

Name _____

Address _____

stood at 114 degrees F. in the shade, and lost only a quart of water. It was used to plow various places in the neighborhood last winter and to bale hay last season and this one for neighboring ranches.

PAID TO BUY TRACTOR.

"My father used to run three 8-mule teams the year around and then didn't get his work done," said Wm. H. Boyd. "Now with a 22-45 tractor he gets the work done right. We have run that machine 22 hours per day for eight weeks at a stretch. You bet it paid to buy that tractor."

RICE IRRIGATION BOXES.

Making boxes to let water through rice irrigation levees becomes a tremendous chore if boards are sawed by hand and not put together systematically. S. M. Joslin and E. Paillex of Placer county, in preparing something over 800 acres for rice last spring, hauled thousands of feet of lumber to a convenient place at headquarters, and sawed them with a circular saw and a six-horsepower engine into standard lengths. At the same time other men were setting these pieces on molds prepared for the purpose and nailing them. Waste motion and duplicated effort were avoided and the engine did the otherwise tedious work.

POWER NOTES.

Keep tire pressure up to 20 pounds per inch diameter of the tire and don't guess at it.

When the rear tires show wear, put them on the front wheels or change them to the other side.

Dirt covers a multitude of strains, loose nuts, cracked castings. Kerosene is the dirt remover for the outside of any gas engine.

He saved an hour a day by overloading his tractor until he came to a time when he lost more days and dollars than the number of hours he had saved.

A booklet illustrating various tractor hitches for farm implements has been published by the Avery Company of Peoria, Ill., and will be sent to any tractor man who asks for it.

Loosened wire connections are the cause of many a weak spark which is the cause of much fuel not burning, which is the cause of thin lubricating oil and the cause of lost power.

Byron S. Swearingen has recently been appointed sales manager for Smith Bros. of Los Angeles, who are distributors for Cletrac Tank-Type tractors, formerly known as Cleveland tractors.

A tractor baling hay in Tehama County became hot unaccountably. It was found that chaff and light hay had been drawn against the front of the radiator until it prevented enough air passing through.

H. G. Knapp & Son, power-lift disk plow manufacturers, have bought 250 feet frontage on the railroad in San Jose, and will move their plant to bigger quarters to be built there. They have outgrown their present facilities.

It is with great sorrow that we announce the death of President F. W. Krogh of the Krogh Pump and Machinery Co., in San Francisco, July 7.

Meters are to be put in for all consumers of electricity generated by the California-Oregon Power Co. in order to save some juice for transmission to needy districts in central California.

Dixon and Griswold, the well-known implement dealers of Los Angeles, retired from business June 30. This firm has for several years been very active in selling several well-known lines of agricultural tools, chiefly the P. & O. line of goods. It is to be regretted that such a live wire organization quits the field, and at this time they make no announcement as to their future activity.

Cheer up! We all have our ups and downs. Try again.

CULTI-PACKER

TRADE MARK REG.

It Cultivates — It Packs

The Largest Wheat Farm in the World

MONTANA FARMING CORPORATION

MARDIN, MONT. October 23, 1918.

The Dunham Company,
Berea, Ohio.

Gentlemen—

We have *over 600 feet—60 Machines* of Dunham Packers on our work, and next to our plows consider them the most important agricultural implement in handling fresh breaking and packing old ground.

We have just finished seeding on our first unit of 7000 acres, every foot of which has been packed twice with Dunham Packers. We first used the packer directly behind the plow and again used them directly behind the drills, seeding and packing at the same operation. By using these machines we were able to plow the sod and turn it over perfectly flat, thereby eliminating air spaces and helping to a great extent to retain the moisture.

Through a delay in shipment during the summer part of our land was plowed without packing and the difference in the moisture content of the soil as a result was very noticeable. The field which was packed having moisture practically for ten inches, while the unpacked field had no moisture below the plowed ground. We plowed in each case about four and one-half inches deep. We packed every acre we seeded directly after seeding and feel that this will give us a yield of two to three bushels more per acre.

The packer not only seems to compress the soil but seems to pulverize it also leaving a very finely powdered surface. It is our belief that all fresh breaking should be packed and in sections known as dry farming sections we think that all seeded lands should be packed.

Very sincerely yours,

Thomas D. Campbell
President

Roots Improve the Dairy Ration

(Written for Pacific Rural Press.)

Follow the work of the Sacramento Cow Testing Association carefully and you will find that the herd owned by A. E. Greene of Hood generally stands at the head of the list for heavy production. His grade Holsteins have excelled registered cows of all the different breeds, and both the general average and the records of individuals in this herd have been exceptionally high. Mr. Greene attributes the high production not only to rigid culling, but also to the fact that he feeds a large amount of carrots.

In the California State Dairy competition, the records made by Humboldt county dairymen will be remembered by all, but how many remember that Iver Iverson of Arcata fed his cows from 125 to 150 pounds of carrots daily during September, October and November, and similar quantities of beets from December to March? Also that he fed only 6 lbs. grain and 10 lbs. alfalfa hay per day? Mr. Iverson's grade cows averaged 531.9 lbs. fat and 10,184 lbs. milk, so his method of feeding brought good results.

Mr. Iverson's case was not an isolated one. The grade cows of G. E. Trigg of Ferndale averaged 553.3 lbs. fat and 9,505.3 lbs. milk and were fed heavily on roots. Mr. Trigg began feeding 80 lbs. carrots a day to each cow about August 1, and during the latter part of November changed to beets, feeding about the same quantity.

J. W. Coppini of Ferndale, whose herd also produced very heavily and won several prizes, fed oxheart carrots when grass became short, and later on substituted beets.

So much for high-record grade cows. Now let us consider the greatest registered cow on earth—Tilly Alcartra—with her wonderful yearly record of 1,322.99 lbs. butter from 33,424.8 lbs. milk. To roll up this record she was fed 5,872 lbs. mixed grain, 2,550 lbs. beet pulp, 3,000 lbs. corn silage, 5,000 lbs. alfalfa hay, and—get this—21,000 lbs. beets. Think of it—an average of nearly 60 lbs. beets per day right through the year, and as high as 80 lbs. during the time of her heaviest production.

Is there a lesson in this for the average California dairyman, who feeds alfalfa hay almost exclusively during the winter season, or perhaps only silage with it? Every feeder who has changed cows from a dry ration to one including roots testifies to the heavier flow of milk resulting. He finds not only that the cows consume large quantities of roots, but that their appetites are whetted for heavier consumption of roughages which, in turn, lead to larger and more economical production.

The average dairyman's most difficult problem nowadays is to furnish cheap concentrates for his cows. Henry says that roots should be regarded not as roughages, but as watered concentrates, high in available energy for the dry matter they contain. He cites experiments to show that a pound of dry matter in roots has the same feeding value as a pound of dry matter in grain. It was found that mangels could replace half the grain ordinarily fed in a ration of hay, silage and grain without reducing the yield of milk, and that with grain at \$30 per ton, mangels were an economical substitute when they could be grown and stored for \$4 per ton. At present each of these figures would be about doubled.

When any of our common root crops—mangels, carrots or beets—are grown to take the place of silage, the comparison of cost is in favor of silage. That is, it usually costs less to grow a ton of dry matter in the form of silage than in the form of root crops. But when we consider the root crops as concentrates to add to hay and silage, or to take the place of concentrates in the ration, the cost of raising them may be high and yet they will be an economical part of the ration—at least during that part of the year when green alfalfa or pasture is not available.

Roots also have a beneficial tonic effect upon animals. They are laxa-

tive and cooling to the digestive tract, and help to keep the cows in prime condition. As a rule a good dairying section is a good root-growing section, and it seems as though root crops deserve a wider recognition for their milk-making qualities. It seems as though they can economically fill a larger place in the dairy ration than they are now given.

NEW ZEALAND STUDIES OUR DAIRYING METHODS.

New Zealand, whose dairymen have the most perfect dairy organization in the world, has succeeded in producing all the products that can be consumed at home, and has sent five representative men to California to study our advanced methods of making by-products, such as casein, sugar of milk, dried milk and poultry feeds.

One of the men, Wm. Dempster, secretary of the National Dairy Association of New Zealand, gave an interesting talk at the recent meeting of the California Dairy Council. He said that it is the custom in his country to have cows milked on shares, the milker getting from one-third to two-fifths of the total receipts. New Zealand has the reputation of leading the world in mechanical devices, and milking machines have solved her dairy labor problem. Over 60 per cent of the 800,000 cows are milked by machines. Most of the milkers own their outfits and take them wherever they go. The machines are quite different from those used in this country, one difference being that the milk goes directly into the cans instead of into pails, and thus carrying is largely eliminated.

The New Zealand milkers are a prosperous lot—often more so than the owners. The average milker has his automobile, while the owner may not be able to afford one. We would not like to see dairy laborers more prosperous than their employers in this country, yet perhaps our dairymen can learn a lesson from this and make their help better satisfied by providing better working and housing conditions. This seems to be the first step necessary to better conditions here at home.

CALIFORNIA STOCK WINS IN HAWAII.

Prof. Gordon H. True, of the University Farm, who recently judged livestock at the second annual territorial fair of the Hawaiian Islands, reports a great improvement over the stock shown last year, and a much larger and better show.

A very gratifying feature was the number of prizes won by California bred animals. The senior and grand champion Holstein cow was from the Napa State Hospital herd; the champion Jersey heifer was bred by J. E. Wherrell of Riverside; the champion Jersey bull and the junior champion Angus heifer were bred by the University Farm; the champion Duroc boar by H. P. Slocum & Son of Wil-lows; the champion Guernsey heifer by A. J. Welch of Redwood City. Two Hereford bulls sold by H. H. Gable, Esparto, for range bulls were shown against eastern and island bred animals and were within the money.

Another proof that a wonderful market can be developed in the Hawaiian Islands for California stock. Let's go after this business that rightfully belongs to us. We won't get it unless we do.

Don't feed calves the froth which rises from skimmilk from a separator. It may cause bloat, scours or indigestion.

Livestock Queries

(Written for Pacific Rural Press.)

Foundered Cow.

To the Editor: A cow took sick about two weeks before calving. She had been fed on alfalfa hay and seemed to be impacted, so I gave her injections and drenches. She got stiff in her legs and had little appetite. She has partly recovered, but is still stiff, has difficulty in getting up and down, and when she stands her forelegs are bent forward. She used to give about six quarts at a milking, but now hardly gives sufficient for the calf.—W. A. P., Fernley, Nev.

(Answered by Dr. E. J. Creely, San Francisco.)

Stand her in some kind of moisture, such as mud or a running brook during the day time and keep her in a dry, well-bedded stall at night. Give her a heaping tablespoon of granular

sal nitre twice daily. Flaxseed tea will prove good and a thick mucilaginous tea might be given daily. Allow her all the cool water that she will drink and provide an abundance of greens in preference to dry food, including carrots, if you have them.

Lumps on Neck of Steer.

To the Editor: A young steer eight months old has lumps all over his neck and brisket. They are of a dirty white color and as large as cherries. What can I do to remove them?—H. V., Carbon.

(Answered by Dr. E. J. Creely, San Francisco.)

Paint the lumps with iodine; then cut into them and apply an ointment made of four ounces zinc ointment, two drams iodoform, 3 drams Balsam Peru. At the same time give internally one-half ounce of Fowler's solution of arsenic daily.

Cows Eat Bones.

I have a little dairy in the marsh and feed my cows hay and grass which grows here. They get plenty of salt, yet they chew bones whenever they can get hold of them. What is the reason?—G. M. B., Belmont.

(Answered by the Live Stock Editor.)

The feed which your cows are receiving is probably deficient in lime and phosphorus. These ingredients are needed in large amounts by cows producing milk, and probably it will pay you to buy alfalfa to feed in connection with your native hay. If you prefer to feed nothing but the latter you should provide your cows with a little ground bone or bone meal, which can be procured at any feed store. Ground rock phosphate is excellent, but you may not be able to procure it.

Potatoes for Hogs.

To the Editor: Are potatoes good to feed hogs?—W. L. R., Manteca.

(Answered by the Live Stock Editor.)

Potatoes fed alone are not an efficient hog feed, either as a growing or a fattening ration. Grain must be fed with them, and it will pay to use a protein supplement, such as skimmilk or tankage. Use from one-sixth to one-fourth as many pounds of grain as potatoes and the usual amount of skimmilk or tankage, which is 3 pounds of skimmilk to one of grain, or one pound of tankage to 10 of grain. When finishing off the hogs, one pound of tankage to 20 of grain is generally sufficient.

Pin Worms in Horse.

To the Editor: I have a horse that has been troubled with pin worms for two years. Have tried all kinds of medicine, but nothing seems to help him. He eats well, but is weak and run down. What can you suggest?—M. F. M., Union.

(Answered by Dr. E. J. Creely, San Francisco.)

Give a teaspoonful of the following each morning in grain: Iron sulphate (desiccated) 1 lb., bicarbonate soda 1 lb. Every tenth day give a rectal injection of 1/4 lb. pulverized quassia chips boiled in one gallon of water. When lukewarm inject and with a cloth hold it in for 10 minutes.

LAST CALL FOR BUTTE CITY SALE.

All aboard for the big sale at Butte City Ranch, Saturday, August 2. A great variety of stock will be offered, including 50 registered shorthorns, 50 registered Berkshire hogs, 125 registered Shropshire sheep and 10 Shetland ponies. This ranch has developed into one of the leading breeding establishments of the state, and its stock and blood lines are too well known to require any comment. The sale offers a wonderful opportunity for beginners to obtain choice foundation stock or for established breeders to secure new blood. Let's go.

Two good feeds mixed together are better for hogs than double either one of them fed alone.

Get All the Butter Fat

PRIMROSE and **Lily** cream separators skim clean. They give you the exact density of cream you want. The large fat globules are never crushed or broken.

They are the **only** cream separators provided with **two wide open cream outlets**. There is no screw to interfere with the full flow of the cream. The cream outlets are not stopped up in any way, because the regulating screw is in the skim-milk outlet.

Asplash oiling system reduces friction to a minimum, lubricating every part, **forcing oil through every bearing**, and adding years to the life of the machine.

The only way to know how superior these separators are is to see them yourself. A nearby dealer will go over every point with you and prove to you that whether your herd of cows is small or large, you can save money with a **Lily** or **Primrose** cream separator.

Full information on separators or any other machines in the list below will be gladly furnished.

Workings of Cattle Protection Act

(Written for Pacific Rural Press.)

Have you studied the cattle protection act to see how it will affect you? Its object is to protect all cattlemen against theft. To do so, of course, there must be a positive means of identification, and the surest way to identify cattle is to brand them. So each cattleman is supposed to have his own brand, and it is illegal for anyone to use a brand without first having it recorded by the State Cattle Protection Board. The State has been divided into districts, and the same brand cannot be used by two different persons in the same district.

The sale or transfer of any cattle or hides should be accompanied by a bill of sale showing number, kinds, marks and brands on the animals or hides. The bill of sale must be signed by the owner, and should two witnesses who have been freeholders in the county for at least two years.

Any cattle offered for shipment by rail must be inspected while in the shipping yards just prior to shipment, and a certificate of inspection filed with the railroad agent. He is not allowed to accept the shipment unless this is done. Hides offered for shipment must also be inspected and accompanied by a certificate. The inspector should be notified at least 24 hours before shipment is made, and a bill of sale, properly filled out and signed, must be shown to him.

A rancher may kill his own cattle without having a license, and he may sell the meat. However, he must keep in a book a record of all cattle slaughtered by him, and must make a monthly report by registered mail to the Cattle Protection Board of all cattle slaughtered or skinned by him. He must also exhibit this record on

demand to any officer of this state. Hides removed from slaughtered or dead cattle should be kept at the ranch for 15 days before selling unless they have been previously inspected.

A person actually engaged in the slaughter business must get a license from the Cattle Protection Board and file a bond in the sum of \$1000. A rancher who buys and slaughters stock to make a profit comes under this head. It is illegal for any person to get a license to kill at a designated place and then kill at some other place without first obtaining permission from the Cattle Protection Board to change his location.

The licensed slaughterer must ask to have his cattle inspected for marks and brands prior to killing. If after 24 hours' notice the inspector fails to appear the slaughterer may kill, but must retain the hides for not less than 15 days. All the rules concerning records and reports named for ranchers are also applicable to the licensed slaughterer.

The retailer must keep a record showing date of purchase, from whom purchased, quantity and kind of all meat of any bovine animal purchased by him. This also includes meat brought from his own abattoir. This record is to be kept in a book for that purpose.

This cattle protection law is now being enforced in 36 counties of the State, and other counties are included as fast as inspectors can be secured. This is no easy task, however, for the inspectors are allowed only 5 cents per head, and often this is not half enough to pay for gasoline. An inspector may have to drive 20 miles to inspect 20 head of steers, for which he receives the munificent sum of \$1. He uses up two hours of his time and has the expense of a 40-mile trip.

The sooner the entire State can be put under inspection the better it will be for cattlemen, but in some sections the inspectors resign about as fast as they are hired, and to keep them on the job it seems necessary to adopt one of two plans.

First, let the cattlemen in a certain section get together and guarantee the inspector a minimum amount per month. This is done at Bakersfield, where the inspector is guaranteed \$150, and even though the cattlemen have to dig down into their pockets occasionally, they feel that the protection which the system gives them is well worth this additional amount.

Second, forget the monetary end and offer to be an inspector for the good of the cause. A cattleman living near a shipping-point can well afford to devote the time necessary to inspect the shipments, or it would pay a grocer or other dealer through the extra trade that he would get by accommodating the cattlemen.

Secretary Jas. B. Newsom of the State Cattle Protection Board, 612 Underwood Bldg., San Francisco, has copies of the law for free distribution, and applications for brands or slaughterer's licenses should be made to him. There have been numerous delays in getting out the "Book of Brands," on account of the difficulty of photographing so many brands, and probably it will be a few weeks longer before the book will be ready for distribution.

Butte City Ranch

OWNED BY W. P. DWYER AND W. S. GUILFORD
BUTTE CITY, Glenn County, CALIFORNIA

SECOND ANNUAL SALE

Saturday, August 2d, 1919

50 REGISTERED SHORTHORNS

38 FEMALES—12 BULLS

These Shorthorns present a splendid selection for the breeder who wants to found a registered herd with modest investment. They are of uniformly good type, in excellent physical condition, and are sired by Victor Stanford, Vermillion, Gloster Archer, Roan Chancellor, Crescent Dale, Gibson's Goods, Ringleader, Sir Type, and other bulls of approved breeding.

There are choice cows with calves at foot, bred heifers, and a very desirable lot of open heifers. All of the bred females are in calf to the Butte City Ranch herd sire, Victor Stanford, who is one of the best sons of Whitehall Sultan and out of a Stamford dam.

Every Shorthorn sold as a single lot is guaranteed to be a breeder, and is tuberculin tested; every young animal permanently immunized against blackleg by Purity Blackleg Agglutinin made by the Kansas process.

125 Registered Shropshires

35 MATURE EWES—40 EWE LAMBS 35 YEARLING RAMS—20 RAM LAMBS

This is the first time within the history of public sales in California that buyers have had an opportunity to buy such well-bred registered Shropshires of splendid type at public auction. The offering is in high-class condition throughout, and represents Broughton, Cavendish, Minton, and Wardwell breeding, the best obtainable. The owners of Butte City Ranch have selected some of their very best Shropshires for this sale, for they believe that nearly every farm in California can profitably own a farm flock, and that the foundation should be of the best.

50 Registered Berkshires

The Berkshire offering is composed of a choice selection of gilts and young boars, in thrifty, vigorous condition, well grown and of the breeding and type that will meet favor with buyers on sale day. An outstanding feature of the offering is the uniformity of breeding. Every animal in the sale is sired by a son of the world's famous imported English boar Epochal, or by a grandson of the world's grand champion boar, Grand Leader 2nd. Besides this the animals in the sale are out of some of the very best breeding sows ever owned at Butte City Ranch.

Every Berkshire in the sale is permanently immunized against hog cholera by Purity Hog Cholera Serum and Mixed Vaccine.

10 Shetland Ponies

Scores of youngsters have been made happy by the purchase of Shetland Ponies from Butte City Ranch, and the owners have selected some of their very best for this sale.

Along the Livestock Trail

(Written for Pacific Rural Press by Thos. F. McConnell.)

Hand's "Keep On" Herd.

Here is a herd of Jerseys, owned by Dr. H. W. Hand, Orland, that superlative adjectives are inadequate to describe. Matrons and heifers, all are good, and the doctor "keeps on" adding good ones. It would require the eye of an expert to find a more beautiful cow than the 10-year-old Imp. Lady La Source. She has a wonderful conformation and unsurpassed quality—oh, well, she was champion of the Island of Jersey twice, so what would you expect?

Prolificacy of Yates' Polands.

Behold Stella! Not the one shown in picture at the Panama-Pacific, but the great Poland-China sow in the herd of R. J. Yates of Orland. During her long and useful career she farrowed 155 pigs in 12 litters and raised 149 of them. From these pigs over \$5,000 in cash was realized, and two splendid daughters of Stella are still in the herd.

Keep your eyes on A Buster, a young boar in the Yates' herd that has tremendous size even in this day of big hogs. But he ought to be big, as he was sired by Long Jumbo and out of Stella. What more could you ask?

Burr Starts New Duroc Ranch.

F. D. Burr of San Francisco is starting at Orland a Duroc-Jersey ranch that promises to be a big one and a good one, too. Some of the pens are already erected and more are going up. The herd at present consists of 40 brood sows and their season's offspring, and they are bright red ones at that.

H. M. Jerome, manager of the ranch, is a great lover of animals, and the animals know it. Besides the Durocs there is a beautiful Percheron stallion that Mr. Jerome drives to town hitched to a small truck without thills and without reins or even a jerk line. The horse is controlled by a system of signals and there seems to be perfect harmony between master and horse.

Bassett's Pigs Grow.

When size, good bone and real quality are looked for, Bassett & Son of Hanford have 4 pigs sired by Kings Timm out of Model Maid that will take the cake. They weighed at 3 months, 86, 91, 93½ and 94 pounds, respectively. They are as much alike as the proverbial "peas in a pod" and of almost perfect form. Also there are 3 October boars sired by Model Fellow out of the sow Hopeful, that weighed 83, 87½ and 90 pounds, respectively, at 3 months of age. These young fellows have been coming right along and are a very good trio.

As an example of how the small animal may outgrow the larger, the pig that weighed 83 pounds at 3 months weighed 269 pounds at 7 months; the one that weighed 87½ pounds at 3 months only weighed 261 pounds at 7 months, but the pigs that weighed 90 pounds at 3 months weighed 286 pounds at 7 months. These figures show gains of 1.44 pounds, 1.55 pounds and 1.63 pounds daily for 4 months. This is not fat, either, and they all look as though they might ultimately reach the 1,000 pound mark.

Poland-Chinas in Paradise.

Judging from the looks of the Poland-Chinas in the herd of J. H. Cook at Paradise, the original Paradise has nothing on California's spot bearing this name. They grow everything there from peas to pineapples and pleasant people, but Poland-Chinas stand out prominently. One of the good ones in Mr. Cook's herd is Whiz Bang, a grandson of Caldwell's Big Bob, and if he develops as he promises he will make some of the eastern boars look like small potatoes. The sow, Molly Wonder 2nd of Pfander and Mouw breeding, is a corker and one that would hold her own in the best company. Mr. Cook is in a fine section and he certainly raises fine hogs.

Quigley's Herefords.

About 12 miles from Paso Robles at Linne (pronounced Lin-nay) is the ranch of Benj. Quigley, where, scattered around under the spreading oaks or ranging over the hills and through the dales, is found one of the best herds of registered Herefords on the coast. The herd sire is Lemuel by Harris Standard 2nd, and he is a good one. As an illustration of constitution and prepotency it should be mentioned that the aged cow, Mercedes, has a beautiful calf at foot by Harris Standard 2nd and another 11 months old by Debonair 6th—two classy calves in 10 months.

Barnhart's Shropshires.

C. E. Barnhart of Suisun, breeder of pure-bred Shropshires, sold wool in 1893 for 4 and 6 cents per pound and dandy black face lambs for 75 cents per head. This year his wool brought 55 cents per pound and the same grade of lambs \$9 per head. Certainly some contrast.

To illustrate what is possible and also probable in the sheep business at present, Mr. Barnhart bought 1,600 ewes last year, paying \$15 per head for them, and the lamb and wool crop brought over \$24,000 this season, thereby bringing back the purchase price in one year. This was under range conditions, but of course, the range is of the best.

Rambouillet Sheep

**SHROPSHIRE,
RAMBOUILLETS**

AND

**AMERICAN
MERINOS**

We have for sale this season 350 HEAD OF PUREBRED SHROPSHIRE RAMS, yearlings and two-year-olds. They are sired by sons of the famous Senator Bibby, one of the best Shropshires ever imported into the United States. He is now nine years of age, and is still hale and hearty.

WE HAVE 500 AMERICAN MERINOS AND RAMBOUILLETS. Our Rambouillets are all from prize-winning rams at the P. P. I. E. Strong, hardy, range-raised stock. We have a fine lot of yearling American Merinos of our own breed.

ALL STOCK SOLD SINGLY OR IN CARLOAD LOTS.

Livestock and Dairy Notes

Livestock breeders all over the state are invited to send on postal cards, notes regarding their sales, State and County Fair intentions, new stock, etc.

LIVESTOCK SALES DATES.

October 18-26—Los Angeles Livestock Show.
November 1-8—San Francisco Livestock Show.

The Dairy.

W. J. Higdon of Tulare has sold a Holstein bull calf to J. W. Snodgrass, Oxnard.

Stockholders of 10 creameries in the San Joaquin Valley have already ratified sales to the San Joaquin Valley Milk Producers' Association.

King Pontiac Hengerveld Payne, the famous Pequest Farms Holstein bull, has been purchased by R. E. Haeger of Algonquin, Ill., for \$100,000.

For the first six months of this year the butter receipts at San Francisco were 11,578,400 pounds as compared with 14,773,700 pounds for the same period in 1918.

A bulletin on milking machines is being issued by the State Agricultural College. The conclusions are that the machines will give satisfaction when operated by competent men.

Recent sales by the Edgemoor Farms, Santee, include 2 Guernsey calves to the Adohr Stock Farms at Owensmouth; a bull calf to Russell S. Cox, Escondido, and one to A. Marone, Oceanside.

The practical value of the new inter-state tuberculosis law is proved by the results of a shipment of 33 cattle from Illinois to Utah. They passed the test before shipment, but on a retest, after arriving at Ogden, 16 were found to be tuberculous.

G. M. Brown of the Burr Creamery, Los Angeles, is very happy over the arrival of a fine heifer calf sired by Matador Segis Walker, the famous Carnation bull, and out of Carnation Rag Apple De Kol, the heifer purchased at the Sacramento guaranty sale.

E. C. Gammon of Hood has joined the Guernsey ranks and has established a fine herd at the head of

which is Escalon Golden Jewel, formerly owned by A. B. Humphrey, Es-

calon. Mr. Gammon has extensive orchard interests and is adding a dairy to keep up the soil fertility.

The Hidden Valley herd of registered Guernseys at Redwood City, owned by A. J. Welch, has been sold to Palo Alto Stock Farm, Palo Alto. It consists of about 55 head, includ-

ing 25 milk cows. The sire is Dairy Maid's Prince. Many excellent records have been made in this herd.

Beef Cattle.

R. L. English of Pasadena, prominent for years in show horse circles, has purchased 10 bred Hereford heif-

Start With Hampshires

THE HAMPSHIRE HOG is the farmer's hog. The sows are prolific, good mothers, excellent rustlers, quick maturing. Because of their high quality and dressing percentage Hampshires are eagerly sought after by packers. If you want to make all the money there is in hog raising, start with Hampshires.

The next step is to get the best of the breed. Individuals of nondescript breeding are apt to be lacking in merit and prepotency; and no pedigree, however attractive, can compensate for a poor individual.

ATTEND THE BIG SALE

In this sale you will find sows with attractive pedigrees and outstanding individuality to back up their blood lines. They are the fruit of a \$25,000 investment in foundation stock alone, and represent the scientific mating of some of the greatest animals of the breed.

65 Bred Sows and Gilts

Four 3-year-old sows, 24 2-year-olds, 21 yearlings, 17 fall gilts. All guaranteed safe with pig; most of them carrying their own guarantees. Everything royally bred and from four great blood lines—Gen. Tipton, Lookout, Gen. Allen and Cherokee Lad. You can't beat this breeding.

The boars to which the sows are bred include Gen. Tipton's Masterpiece, the best son of the grand champion; Exalted Ruler, a Lookout boar by Exalted Lad, 1918, grand champion of Iowa; Draper Laddo, a Cherokee Lad boar; and Gen. Allen's Counterpart, by Gen. Allen, undefeated grand champion.

Wednesday, August 6th

Sale will be held at the Ortega Underhill Rancho, 4 miles east of Santa Barbara on the Coast Highway, near Montecito. Free transportation from Santa Barbara. E. C. Stone will be there. A State Hampshire Association will be organized in the morning. Free barbecue at noon. Sale starts at 1 o'clock. Be sure to attend. For catalog and full information address

Auctioneer

Hats Off to the HAMPSHIRE

The Hampshire has become America's most popular hog by sheer force of merit. The 1918 International Livestock Show was his last great record, winning grand championship over all other breeds, and selling for \$2.25 per hundred above his nearest competitor.

The Hampshire is the ideal hog for California conditions, as he is a natural foraging, green feed hog, and thrives well on our alfalfa and other succulent grasses, therefore requiring less grain than other breeds.

If you are looking for the greatest meat producer, investigate the Hampshire. Send for free information and literature about the progress of the breed and its adaptability to California conditions to

WALTER FOLK, Western Representative, American Hampshire Record Association.
SANTA BARBARA, Route 2, CALIFORNIA

ers from W. D. Johnson & Son of Kansas City as foundation material for a herd that he is establishing in southern California.

Elmer Murphy of H. L. & E. H. Murphy, Perkins, has gone to the middle-west to bring out a bunch of high-class Shorthorns.

L. A. Nares of Fresno, president of the California Cattlemen's Association, and H. A. Jastro of Bakersfield, (Continued on page 114.)

Pays to Feed Out Culls

(Written for Pacific Rural Press by Geo. L. Horine, Winton.)

In the Rural Press of June 28 is a story regarding the methods used by two breeders of registered hogs in marketing their culls. Likewise the question is raised, whether it is better business to sell culls or feed them out until ready to butcher before disposing of them.

To my mind there are several reasons why the breeder should feed his culls instead of selling them as shotes. The breeder—that is, the successful breeder—is admittedly able to produce better hogs in less time than the mere feeder. There is no chance for argument here—breeding stock speaks for itself. The breeder understands the individual characteristics and peculiarities of his particular strain of hogs better than anyone else. Some hogs will eat slop feed; many will not. Some will fatten on pasture; others will hold their own and no more in stubble. Skimmilk and blackeye bean culls will fatten one bunch, and cause sickness in another. No feeder can buy up a lot of hogs from a dozen herds and feed them so as to get the greatest possible returns from each individual hog.

Another point against selling feeders is the reflection cast upon the breeder. A pure-bred hog in the feed lot is sure to be pointed out as a "registered hog from Mr. So-and-So's herd," and as such is bound to be a poor advertisement wherever he goes. A cull on public display, as it were, is an admission that the particular herd he is from is a producer of culls. He may be only one out of a dozen or a hundred, but the psychological effect upon the would-be pure-bred prospect is the same.

Closer culling at farrowing time is

a great step in solving the question. Saving all the pigs possible is of course imperative, but if after the litter is a day or so old the weaklings are discarded, those that are left have a much better chance to develop into breeders, and thus the general average is raised. Saving runts may pay on some ranches, but it does not for me. As a result I have few culls.

As to feeding those that are absolutely culls and nothing else, I have been able to get 200 pound hogs in 6½ months. On a recent bunch of eight barrows marketed at 196 days of age, averaging 191.7 pounds apiece, I made a good profit. Knowing how to feed and finish my particular strain at this early age paid me 18 cents per pound, f. o. b. shipping point, when the market was 17¼c. These barrows were fed grain in self-feeders until 10 weeks of age, when they were cut down to 2 pounds per day per hog. This was continued until six months when they were fed 8 pounds per day for 15 days. The grain was rolled barley, soaked, and they were on good alfalfa pasture after three weeks of age.

Figuring barley at 2½ cents, the grain cost per hog was as follows:

First ten weeks, including sows' feed	60 lbs.	\$1.50
10 weeks to 6 months...	210 lbs.	5.25
6 months to 6½ mos...	120 lbs.	3.00
	390 lbs.	\$9.75

This means a grain cost of almost exactly 5 cents per pound live weight of finished hog. Of course the alfalfa pasture, the upkeep of the sow before farrowing, etc., should be figured, but no one but a pessimist can see loss in such a proposition.

Tulare Duroc Sale Another Success

(Written for Pacific Rural Press.)

Breeders from all over the state responded to the potent lure of quality at the second sale of the Tulare County Duroc-Jersey Breeders' Association, held at Tulare, July 16, and the average of \$114 for the first sale was beaten by over \$5, as the 57 head offered brought an average of \$119.30.

A short program to dedicate the new sales pavilion preceded the sale. Then Col. Geo. W. Bell took the box, and when it comes to crying hog sales, he certainly can "ring the bell." He did not allow interest to wane for an instant, and the bidding was spirited.

The top of the sale was the tried sow Ohio Lady, bred by Elmer Lamb of Ceres, consigned by Joe M. Chinowth of Visalia and bought by Alex-Whaley of Tulare for \$300. Mrs. W. L. Fisher of Visalia was the heaviest buyer, taking 8 head for a total of \$840. J. W. Schmitz of Madera secured 6 head for \$820. Other buyers were J. R. Weisenberger of Terra Bella, H. E. Spires of Caruthers, Post Card Ranch of Corcoran, Sturgeon Bros. of Lemoore, A. E. Poston

of Tulare, J. C. Rogers of Wasco, F. D. Burr of San Francisco, Allen Thompson of Tulare, Chas. Hubbard of Riverdale, C. C. Putman of Honolulu, A. B. Trech of Bakersfield, J. G. Roberts of Madera, W. F. Thompson of Porterville, W. J. Higdon of Tulare, Elmer Lamb of Ceres, S. M. Padias of Santa Ana, M. C. Allen of Bonita, W. A. Jenkins of Tulare, W. L. McDowell of Strathmore, R. C. Sturgeon of Tulare, C. W. Townsend of Bakersfield, W. L. Caldwell of Visalia, W. A. Meyer of Sacramento, Oscar McDowell of Strathmore, Frank Hesse of Tipton, C. P. Morgan of Shafter and R. E. Chinowth of Visalia.

Several new breeders were started and many of the hogs went to distant homes—to San Diego and Glenn County in this state and across the waters to Honolulu. The Tulare County breeders are putting their section on the map as a red hot center. The affairs are in the hands of live wires who are backing up good hogs with good business methods. Watch their smoke!

Hog Feeding Method Sounds Good

(Written for Pacific Rural Press.)

E. C. Green of Coleno, Mendocino county, writes us: "In reading the California Hog Book I came across the following: 'It is unfortunate that the dairy hogs cannot have some of the grain from the stubble hogs and that, for a part of its life at least, the

stubble hog cannot have some of the milk that the dairy hog has in excess.'

"Those who have handled hogs on stubble know that the growth and gains under the best conditions are slow, the reason undoubtedly being that they do not get a balanced ration. Last summer I tried an experiment to see if I could overcome this difficulty. I took alfalfa meal and moistened it with buttermilk and whey from the creamery, and hauled it daily to the hogs on stubble, being careful to feed on hard ground.

"The hogs took to it immediately. I was able to feed the fields closer; put faster gains on the hogs, thus insuring earlier marketing; in fact, I turned two carloads off the stubble where ordinarily I could figure on only one. No record was kept of the actual gains, but from close observation I am satisfied that the experiment was a success."

MONTELENA HERD —OF LARGE— YORKSHIRES

LAKE PARK KING 25211

Grand Champion Boar—California State Fair, 1917.

Due to the ever increasing popularity of the breed, Yorkshire breeders are almost entirely sold out, and it would behoove the prospective purchaser to place his order soon. We are only able to offer at the present time a very exceptional lot of fall pigs, some sired by "Lake Park King," others by "Montelena Prince 2d." They are out of such sows as "Deer Creek Nena 8th," present Grand Champion sow of the State, who has averaged a fraction over 17 pigs per litter for nine consecutive litters; "Riverina Nena 9th," one of her best daughters, and "Lake Park Lady Frost 291st," the top sow at the Thomas H. Canfield sale last year.

We solicit your correspondence.

A. L. TUBBS CO.

CALISTOGA

CALIFORNIA

IF—

Your sows farrowed 18 to 30 live pigs per year—Your market hogs averaged 200 lbs. in 6½ months—Your herd contained the blood of CRIMSON MONARCH, GOLD MODEL, CRIMSON WONDER, ORION CHERRY KING, and GREAT WONDER—You had a DEMAND for BREEDING STOCK that you could not supply—

Would you talk about it?

To help any California farmer who wants to make a start with REGISTERED DUROC-JERSEYS, I am selling until August 10th, weaned pigs, open and bred gilts, bred sows and herd boars on easy terms. A small payment secures such stock as you desire, balance on a time basis without interest.

Write today for full particulars, including prices, pedigrees, etc., stating sex and number of animals interested in.

GEO. L. HORINE,

WINTON, CALIF.

SAN JOAQUIN COUNTY POLAND-CHINA BREEDERS' SALE.

Not to be outdone by the other county breeder organizations, the newly formed San Joaquin County Poland-China Breeders' Association will hold a sale at Stockton, September 19. There will be 40 outstanding fall and spring boars and 20 choice bred sows and gilts of Big Bob, Ursus, Jr., and Golden Gate King breeding. The consignors will be Young & Clark, Langhorst Bros., Eugene Miner, John Hazel, Geo. V. Bechman & Sons and J. F. Lehman.

FRESNO POLAND-CHINA SALE.

Some breeders form county associations and plan big things, but never carry out their plans. Not so with the live wires who organized the Fresno County Poland-China Breeders' Association a few months ago. They immediately got busy and planned for a sale of corking good sows and gilts that would win them fame from one end of the State to the other.

Although the association is young, the men behind it are old-timers. They have bred Poland-Chinas for years, have been prominent winners at shows, and have some of the best stock in the state. The choicest of this will be offered at the sale of 50 bred sows, bred gilts and open gilts, to be held at the Fair Grounds, Fresno, Wednesday, August 20th. It will be a big even, and those interested in money-making hogs should plan to attend.

ANOTHER HANFORD POLAND-CHINA SALE.

When it was announced that different groups of Kings County Poland-China breeders would hold fall sales, it was supposed by many that this would end the association sales. Not much. The association is bigger and stronger than ever, having recently taken in eight new members, and will hold one of its regular sales at Hanford October 11. But the mem-

bers are raising Poland-Chinas in too large number to include all of their offerings at this one sale, so it will be supplemented by sales of combinations of breeders—four already being announced for September and October, as will be seen from our list of livestock sales dates in another column.

"This shows you that Kings County is establishing herself as the real Poland-China center of the Pacific Coast," says W. Bernstein. Looks so, doesn't it?

THE BIG HAMPSHIRE SALE.

The 65 bred sows and gilts that will be offered at the Underhill Hampshire sale at Santa Barbara, August 6th, represent the mating of some of the greatest individuals of the breed by a man who has made a study of the science of breeding for over 35 years, and never breeds a sow without a definite purpose in view. They are not the culls, but the surplus stock, due to a natural increase of the herd.

Their blood lines are of the four great strains of the breed, and you can get live-bred animals of any of these strains, or straight bred animals with the blood lines crossed. You can find prize-winning prospects or breeders for pork production, as you prefer.

If you are not sure about the Hampshire hog, attend the sale and investigate. Be at the Hampshire meeting in the morning, and don't overlook the big barbecue at noon. You will be welcome whether you intend to buy or not.

CARRUTHERS' BERKSHIRE SALE.

Here is an opportunity to get good young stock from the herd that holds the coast record for the two top sales of Berkshires. Nothing will be reserved. About 40 young sows and 30 boars will be offered, among which will be some that can be developed into prize winners. Yet it will be strictly a breeders' sale and high prices are not expected. There is

hardly a better way to make money than by buying young stock and growing it out, so be sure to attend this sale, August 16th, at the Carruthers' Farm, three miles west of

Live Oak, Sutter County, California.

Keep the pigs growing every day until they are ready for market; it makes big interest on the investment.

The BIG Poland China Sale

Hogs are selling at the highest prices ever known—\$23 at Chicago and \$21 right in the San Joaquin valley. The dearth of meats and fats abroad assures a high market for years. Now is the time to get into the game. The Poland-China is the hog to start with, and the kind of stock you want is raised by the

Fresno County Breeders

Seventeen of the leading breeders of the county have consigned the tops of their herds in order to make a big success of this first sale of the Fresno County Poland-China Breeders' Association.

50 BRED SOWS, BRED GILTS, OPEN GILTS

Wonderful brood matrons, with great stretch, strong backs, heavy bone, well-sprung ribs, easy-feeding qualities—everything you look for in profit-making hogs. Bred to outstanding boars.

Nearly every consignor secured his foundation stock from the Corn Belt, and in the pedigrees of the animals offered you will find the most noted blood lines of the breed.

Wednesday, August 20th Fair Grounds, Fresno

Come early and look over the stock. Free lunch at 11:30. Sale starts promptly at 12:30. You can't afford to miss it.

LIVESTOCK AND DAIRY NOTES.

(Continued from page 111.)

formerly president of the American Livestock Association, say there is no justification in the present beef prices now charged by the butchers to the consumers. Mr. Jastro believes that if the Kendrick bill passes the evil will be remedied.

Conaway Ranch, Woodland, has purchased the entire well-known herd of Shorthorns owned by A. W. Foster of San Francisco. It will be remembered that C. Harold Hopkins, the manager of the Conaway Ranch, was the purchaser of the \$5,500 Shorthorn bull at the Davis sale last spring. He is getting together one of the greatest herds of Shorthorns in the state.

Swine and Swinememen.

The sale of the Poland-China breeders of Fresno County will be held August 20 instead of 26 as previously announced.

Cloverdale Farms, Escondido, have just delivered 10 weanling Poland-China pigs to the American Beet Sugar Co., at Chino. A service boar was recently sold to the same parties.

Mrs. Viola L. Renwick of Santa Barbara, owner of El Profito herd of Poland-Chinas, is expecting a Big Bob gilt from E. D. Frazier, Drexel, Mo. She will be bred to the great boar Buster Model.

Recent sales of registered Durocs by the Charnock Ranch at Hemet include 2 gilts to Newman & Bush at Riverside for \$175 each; 4 bred gilts to the Agua Mansa Ranch at Colton, and 15 fall gilts to Mr. Hulse, San Jacinto.

Mr. Eastman, of the Eastman-Dillon brokerage firm of New York, is starting a Poland-China ranch on Chatsworth Boulevard near San Fernando. Homer L. Graham, formerly swine herdsman at Santa Anita Rancho, has the work in charge.

Sales of Berkshires at the Lark Meadow Ranch, Geo. E. Stingle, proprietor, El Monte, include: One gilt of Master Gabriel and Superbus breeding to Frank M. Hinton, Santa Fe Springs; 1 boar of the same breeding to C. N. Esender, to go to Moapa, Nevada, where Mr. Esender is starting a Berkshire ranch.

Tom M. Bodger, Gardena, reports sales of Hampshires as follows: Two gilts and 10 weanlings to E. F. Mitchell, Tranquillity; 1 weanling boar and 1 sow to W. W. Crockett, Covelo; 1 weanling sow to Mrs. F. W. Rublie, Inglewood; 1 weanling sow to D. M. Towne, Gardena.

A. D. McCarty, secretary of the California Poland-China Breeders' Association, has scattered the announcement throughout the east that if visitors to the coast will call at his office he will see that they are escorted through the fields of tall alfalfa to the spots where the best Polands are grown. This is the kind of breed promotion work that gets results.

H. C. Witherow of Greenwood Farm, Live Oak, says that his best pigs are by Johnson's Defender, Jr., and out of daughters and granddaughters of Model Col. and their old sow, Col. B's Queen 4th. This represents the mating of sows of uniform breeding to a good boar of a prominent branch of the same family. Mr. Witherow considers this practice essential in building up a strong herd

and the results seem to prove that his theory is correct.

Sheep.

The Second Annual Western Ram Sale will be held at Denver, September 30 to October 3.

F. A. Ellenwood of Red Bluff recently sold 200 spring lambs to a San Francisco butcher for \$10 per head.

The Department of Agriculture announces that collection of excess profits from wool dealers is proceeding and that their distribution to wool growers will begin in the near future.

The Fourth Annual Ram Sale of the National Wool Growers' Association will be held at Salt Lake City, August 26-29. Bullard Bros. of Woodland will consign 25 Rambouillet stud rams and 100 range rams. Ellenwood & Ramsay of Red Bluff will consign 25 half-blood Corriedale rams.

Livestock Miscellaneous.

Stockmen from the 13 western states gathered at Salt Lake City this week to discuss matters of interest to the cattle and sheep industry. It was planned to offer a resolution advocating the passage of a bill by congress to place public grazing lands under federal supervision.

Pork Production

BY ACTUAL TEST PURE HAWAIIAN CANE

MOLASSES

will increase pork production approximately five-tenths pounds daily over a barley and tankage feed, yet it sells for less than half the price. Do you know of any other feed at any price that will do this?

Why not get all the profits out of your hogs?

Write us immediately for a copy of above test.

CULLING THE FLOCK.

If you have not already begun culling the flock it is time to begin. Feed is still high and prices for hens are higher than they will be later on when the surplus stock is marketed. As a rule, it is advisable to put hens on the market before it is "flooded."

The production of a hen is usually greatest during the first two laying seasons; also mortality increases with age. Consequently, as a rule it is best to keep only what two-year-old hens you desire for breeders and to dispose of the balance. However, the heavier breeds generally keep up productions longer than the lighter breeds, and if you have Rocks, Wyandottes, Reds, or Orpingtons, it may pay you to keep through the third laying season hens that show good vitality, moult late and measure up well according to the Hogan system.

Vitality is the chief consideration in selecting hens to keep. All showing symptoms of disease or low vitality should be culled, irrespective of breeding or good points. The actions of the hens usually indicate their physical condition. The weak are inactive and dull and are likely to sit around a great deal. They are the first on the roost at night and the last off in the morning. They do not range for feed and do not sing like busy birds. A hen with a long neck, thin beak, narrow head, long slender body and long legs and thighs can be put down as one low in vitality; while a strong, vigorous bird will be found just the opposite. The active bird usually has a short stubby beak and toenails, as these become worn while she is scratching for feed.

The hen to keep should have a bright, prominent eye, a well-developed, blocky body, an erect carriage, bright comb and wattles, and should be active at all times. A good layer is never idle.

Next, consider the time of year the hen moults. One that stops laying in the summer and moults early is not a high producer. When a hen moults during warm weather it takes much longer for the moult to become complete, and consequently her period of idleness is much longer. Hens that moult late in the fall usually lay right up to the time they moult; the moult is rapid, and they get to work again in quick time.

The color of the skin, shanks and beak should be considered. Of the yellow-shank breeds the poor-producing hen will be found to have bright yellow shanks and beak at the end of the laying season; while the persistent layer will have these parts faded out and of a whitish flesh color.

When the Hogan method of culling is used the distance between the pelvic bones and the condition of these bones should be taken into consideration. If they are thick and close together the hen is not a good layer and should be discarded. If they are thin and wide apart, showing flexibility and great abdominal capacity, the bird may be considered a good layer and one well worth keeping.

It is a pretty good plan to spend a little time each day looking over the flock, instead of waiting for a definite culling time and doing it all at once. In this way you can pick out all of the inactive birds, those that are in any way diseased, and those that are starting to moult too early. These can be marked and when the time of culling comes it can be done with less work and in less time.

SUMMER CARE FOR GROWING CHICKS.

Although chicks may be hatched from eggs produced by strong, vigorous hens and may be carefully brooded, their growth will be retarded unless they receive the proper attention during warm weather. They should be provided with plenty of nutritious food, including green stuff, dry mash and grain, according to the formulas which we have already

given. If the rations are varied better results will be secured, and a mixture of grains will always give better results than any one alone, irrespective of the nutritive value.

Charcoal, grit and oyster shell should be available at all times. If skim milk is available it should be fed, preferably sour, and in this case the beef scrap in the mash may be reduced about one-half; in fact, unless this is done when the pullets begin to mature it will cause too early laying.

Whenever possible growing chicks should be allowed free range so that they may obtain natural green feed, such as grass, alfalfa and clover, and also bugs and worms. Green feed is not only an excellent tonic but absolutely necessary for the proper development of chicks, and when they can not obtain it on range it must be provided.

The matter of clean, fresh water cannot be over-emphasized. Where running water is not provided the supply should be changed twice daily and the water should be kept in the shade. The pans should be cleaned daily before fresh water is added.

Keep the coops and houses clean and sanitary. Disease most frequently starts in unclean quarters. Houses should be cleaned at least once a week, and clean sand or straw should be scattered over the floor. Lime is good to scatter over the droppings if they are not cleaned up daily. When chicks are confined to a pen the ground should be spaded at frequent intervals so as to provide fresh ground for them to scratch in. The chicks should be examined occasionally for lice, and if these pests are present immediate steps should be taken to kill them.

CARE IN HANDLING EGGS.

Good fresh eggs put in a basket and stored in the hot kitchen for a day or two may reach town in such condition that they must be used at once to be available for food. A basket of perfectly fresh eggs left on the back of the wagon and exposed to the sun during a 10-mile drive to town may reach the country merchant in such shape that not even immediate chilling will make them available for long shipment to the cities. This is the story constantly revealed by the candle on the egg car. Eggs of which the farmer's wife is very proud will show that they have been allowed to remain 24 or 48 hours in the nest or at some point in their history have been exposed to heat, which lowers their value. It is evident, therefore, that if the egg is to be palatable to the city consumer care in its handling must begin on the farm. The farmer must gather his eggs twice a day and must keep them cool afterwards, just as he would cream or milk, until they are delivered in town. There the merchant must at once put them into a dry, cold place, or, if he wishes to be strictly up to date, must chill them in his own little refrigerating plant of the town, to a temperature well below 40 degrees.

Heat is the great enemy, for once a good egg has stood for any time at a temperature of over 68 degrees it begins to incubate if it is a fertile egg, or to spoil if it is an infertile egg.

DUCK-O-GRAMS.

If ducklings are allowed to swim when small, many will get cramps and die or else become stunted and never make good, large ducks.

It is estimated that it costs about five cents per pound to feed ducks up to ten weeks of age, two cents for labor, two cents to market, and three cents for eggs, etc., making a total of twelve cents per pound. All over that is clear profit.

Very small ducklings should never be allowed out in a shower as they will often stay out until they get so chilled they cannot walk, and sometimes will sit outside a coop with

their heads up in the air and drown. Ducks are liable to stampede in the dark when frightened by an intruder. When raising large flocks of ducks, allow a lantern to burn all night in the house and keep dogs or cats away. Many valuable ducks may be killed in a stampede.

Water should be given before feeding ducklings as they eat so greedily they may choke if they do not have the water to wash the feed down.

Poultry Breeders' Directory

WHITE LEGHORNS are the most profitable breed of poultry. If you are in the business for profit, you will eventually have them. EASTMAN'S BRED TO LAY Hoganized and trapped Barred Plymouth Rocks. September chicks. Fairmead Poultry Farm, Fairmead, Calif.

FOR SALE—72 purebred S. C. Rhode Island Red pullets. April hatch; Eastern stock. Two dollars each. Mrs. Alice Jeter, Esparto, Cal.

GOLDCROFT BUFF ORPINGTONS—Winners San Jose show. Choice stock for sale. Samuel Abrams, Los Altos, Calif.

CHICKENS, DUCKS, GEES, GUINEAS, Pea Fowl, Pigeons. Wm. A. French, 545 W. Park St., Stockton, California, Stamps.

BUFF ORPINGTONS, BUFF DUCKS, BOURBON RED TURKEYS—The Ferris Ranch Rt. 2, Box 144D, Pomona, California.

HIMALAYAN WHITE FUR RABBITS. Mock Ermine. Mrs. Leroy Hackett, 3306 "P" West St., Oakland, Calif.

BRONZE TURKEYS—Albert M. Hart, Clements, Calif.

RABBITS.

I HAVE the following rabbits for immediate delivery, 6 mo. and over. Pair Himalayan and litter, 6 does, 5 white bucks, 13 white does, 18 New Zealand does and bucks, 25 Belgian does, 16 three-quarter Flemish does, 2 black, 1 gray, 1 steel Flemish bucks; 7 checked does; also the following, 3 to 5 mo. old: 37 pedigreed New Zealand bucks and does; 2 black, 1 steel Flemish buck, 2 3/4 Flemish does, 1 gray, 3 steel Flemish does; also many others and several hundred young, all breeds; prices right; health guaranteed; ship anywhere, guarantee safe arrival and satisfaction. V. C. Howe, E 14th St near Knox Ave., San Leandro, Cal. Mayward car to door.

RAISE RABBITS—Most profitable and popular small animal in America. Big demand. Clean, fascinating work. Send 10c for copy of leading rabbit magazine and our Rabbit Books, P N 5. Gilmore's Rabbit Farm, Santa Barbara, Calif.

NEW ZEALAND REDS—First class utility does bred \$5.00 each. Young does, \$2.50 each. F. R. Caldwell, Broadmoor, San Leandro.

RAISE RABBITS FOR US—We supply the breeding stock. Send stamp for particulars. H. E. Gibson Co., Arcadia, Calif.

THE HOME CIRCLE

LIFE AND TEARS.

When I consider Life and its few years—

A wisp of fog betwixt us and the sun;

A call to battle, and the battle done
Ere the last echo dies within our ears;
A rose choked in the grass; an hour
of fears;

The gusts that past a darkening
shore do beat;

A burst of music down an unlistening
street—

I wonder at the idleness of tears.

Ye old, old dead, and ye of yester-
night,

Chieftains, and bards, and keepers of
the sheep,

By every cup of sorrow that you had,
Loose me from tears, and make me
see aright

How each hath back what once he
stayed to weep;

Homer his sight, David his little lad.
(Author unidentified.)

A FARM WATER SYSTEM.

It seems hardly necessary to urge upon Californians the necessity for an adequate water supply, inasmuch as this is a land of irrigation, and most ranchers and farmers of this particular edge of the world are familiar with the use of a gasoline engine for pumping water over their lands, and they have also learned that such an engine is most practical for many other things besides pumping water for irrigation purposes. One of these uses is to furnish the power for supplying running water through the house. And while the majority of rural dwellers have long since seen the wisdom of, installing their own water systems, there are still some who cling to the old laborious method of carrying water by hand from a well, or hauling it from a distance by horse power; and it is the ear of these that we would gain in this dissertation.

A sanitary water system for the home has four distinct features, viz.: (1) a pure water supply; (2) pumping, storage and distribution; (3) a durable and simple plumbing system; (4) a safe disposal for sewage; and we shall take them up in this order.

Pure Water Supply.

A sanitary water system is the most important feature for every farm home. Whatever other advantages in the way of modern equipment the farm may enjoy, they rank second in importance to a pure water system for family use. Indeed, many diseases (particularly typhoid) are directly traceable to an impure water supply. Farm waters particularly are more susceptible of pollution than are waters from other sources; this is due to poor surface protection. Wells are usually located for convenience near the barn, stable, or back door, where waste water is thrown out. Through seepage the water is contaminated by the organic filth which percolates through the soil. A well should be above stock pens and barns so that the surface drainage is away from the well. Even cistern water does not escape pollution, for the accumulation of months of germ-laden dust, decayed leaves, etc., which are deposited on the roof during the long dry season here in California is a constant menace. For this reason every cistern should have provision made for proper straining and filtering of the water before it is allowed to run into the cistern. There should also be an overflow drain and a close-fitting cover over the top to keep small animals, rodents, etc., from falling in.

Springs as a rule draw their water supply from great depths, which is usually filtered through beds of sand or gravel, and are therefore good sources for pure water. However, this is not an absolutely reliable source of water supply, for springs are subject to the same pollution as are wells—through seepage of impurities, and the same precautions should be taken as in the case of

wells. A spring should be thoroughly cleaned out, and then walled in with stone and cement, and covered with a double slant roof with a door in one gable. If one is disinclined to do this, the spring should at least be fenced to keep out stock.

Pumping, Storage and Distribution.

After an adequate supply of pure water has been made available for the home, a suitable pumping equipment must be selected, and then means for distributing and storing the water must be provided. The quantity of water will depend on the power used, whether it be a windmill, electric motor, gasoline engine, hydraulic ram, or gravity pressure. A storage tank should be of sufficient capacity to hold at least 200 gallons if the water is to be used for household purposes only, or 500 gallons if the barn is to be supplied; this varies, of course, according to the number of stock to be watered. These above-mentioned amounts of store water do not provide for protection against fire or other emergencies.

Where gravity pressure is used, and the spring or storage tank is, say, 600 feet distant from the house, its height should be somewhere about twenty-five feet higher than the highest point to which the water is to be carried. A three-inch pipe in this case carries a strong pressure except in the very dry season. The height of the water source, and the distance the water travels (as considerable pressure is lost in pipe friction), determine the amount of the pressure; also the size of the pipe reduces or increases the amount of pressure—the larger the pipe, the greater the pressure, and vice versa.

Simple Plumbing.

The water pipes should be placed so as to carry the water in as nearly a straight line as possible to the point of discharge. In such a small system as is under discussion, strict avoidance of all lead in either pipes or receptacles should be religiously observed. All the plumbing should be thoroughly tested before use; this can be done by filling with water to detect any leaks. When in use the discharge pipes should frequently be flushed to insure the carrying off of all waste material.

Sewage Disposal.

Sewage can be disposed of either by septic tank, cess pool, or filter bed, although the septic tank is probably more desirable because it is more sanitary. Grease from the kitchen or dairy should not be allowed to enter with the sewage, as it clogs the system and soon puts it out of commission; therefore a grease tap should be provided which eliminates this difficulty.

With such a water system as outlined in the foregoing, the farm house can be equipped with a modern bath room, lavatory, toilet, kitchen sink, and hot water tank connected with the kitchen range. If desired, the hot water tank can be placed in one corner of the bath room, thus obviating the necessity for further heating the room for bathing purposes.

One man claims that he installed a water system on his place about ten years ago at a cost of \$75.00. Another man's system, with the aid of a plumber, cost him \$175.00. This was also about the same number of years ago, which systems it goes without saying, could not be installed at the present time at so little cost. However, no farmer or his wife who has once known the advantages of an adequate water supply, would deem any expense too great when they stop to consider that it is fully compensated for in the saving of physical and mental energy.—Z. D. H.

TO MAKE SURE.

"Were you very sick with the flu, Rastus?"

"Sick? Sick? Man, Ah was 'so sick mos' every night Ah look in dat casualty list for mah name."

TASTY RECIPES.

Sauce for Puddings—Rub together a half-cup of butter and a cup of sugar to a cream; add the well-beaten white of one egg and a cup of strawberries or other fruit mashed through a sieve; put all together and beat well.

Fruit Jelly—3 tablespoonfuls granulated gelatine; 1 scant cupful cold water; 2 cupfuls boiling water; 1 orange; 1 cupful sugar; 4 lemons; 1 sliced banana. Soak gelatine in cold water until soft. Shave very thinly the lemon rind, using none of the white. Steep it in the boiling water 10 minutes. Then add the soaked gelatine, sugar and lemon juice, and when dissolved, strain. Put layer of jelly in a mold. Let it stiffen, add a layer of fruit, then carefully pour in some liquid jelly. Let stiffen; add fruit and liquid until mold is full. Set on ice to harden.

Nut Cakes—One-half cupful butter; 1 cup sugar; 2 eggs; ½ cupful milk; 2 teaspoonfuls baking powder; 1½ cupfuls flour; 1 teaspoonful vanilla; 1 cupful chopped nuts, floured. Cream butter, add sugar. Add yolks of eggs, well beaten. Mix flour and baking powder and add alternately with the milk to the first mixture. Add chopped nuts, rolled in flour, and fold in stiffly beaten whites of eggs. Bake in small tins, 15 to 20 minutes.

Chicken a la King—2 cups of cold cooked chicken cut in cubes; 2 cups of cream sauce; 2 pimentos cut in long strips with the scissors; salt and pepper to taste. Add chicken and pimentos to the hot cream sauce and place over hot water until ready to serve, then pour over toasted bread cut in triangles.

Blackberry Jam—Pick over and wash the berries and mash with a wooden spoon. Bring gently to the boiling point, then press through sieve. Add 1 cup boiling water to the portion that does not pass through the sieve. Reheat and again pass through sieve. Weigh the strained blackberry juice and pulp, add an equal weight of sugar and boil until thick, stirring frequently.

CRUELTY TO ANIMALS.

No matter what the argument animal trainers may put forth, it is elemental that wild animals do not like to be caged for their entire lives. It is equally obvious that elephants do not relish being chained by the legs, as they are day and night in exhibitions. They weren't born to do that, and it isn't their natural state. Humans do not yearn to be caged and chained, and much less do beasts of the fields. Furthermore, it is a fact known to all showmen that ferocious animals are beaten cruelly, frightened by pistol shots, and burned with irons before they become submissive enough for exhibition purposes. As for dogs, this writer asserts of his own personal knowledge that many trainers—more especially the foreign ones—are unbelievably cruel to them, not only in the course of training, but in the event of shortcomings in exhibitions.—The Morning Telegram, N.

HEARD 'EM TALK.

One negro soldier in the Argonne was as pale as circumstances would permit, and visibly shaken.

The PREMIER BURNER

Makes a Clean Gas from Kerosene

(common coal oil)

If there was a better oil burner than the PREMIER, we would be offering it for sale.

We have so many pleasant things said to us about the PREMIER that it makes it a pleasure for us to offer it for sale.

Any one can install it;
Every one can operate it;

One and one-half minutes to start—then its action is automatic. Before you provide your winter's fuel, would be well to find out how much money and how much work a PREMIER will save you; then there are your hands to consider—the PREMIER does not make any soot or smoke, and of course there is no ashes.

Complete Outfits, \$12.50 and up, according to requirements.

No obligation in asking for information.

VAUGHAN & MATTISON, Pacific Coast Agents

225 MARKET STREET,

SAN FRANCISCO, CALIF.

"It's de tawkin' shells what gits me," he confided to the lieutenant.
"Nonsense, Sam; shells don't talk."
"Don't you tawk thataway to me. I kin hear 'em plain as day. Four dese ole G.I. cans jus' whizzed by and I heard 'em say: 'Niggah, you ain't going back to Ala—BAM!'—Stars and Stripes."

CAUTIONARY.

A Georgia colored preacher has more than one way of making sure that none of his parishioners let the contribution plate pass unnoticed.

"We have a collection for foreign and domestic missions dis morning, bredren and sisters," he announced, one Sunday morning, "and for de glory ob heaven, whichever one ob you stole Widow Johnson's sheep don't put a cent on de plate!"

Tannin is all right for tanning leather, but nobody wants it in tea.

The way to get tea-flavor without tannin is to buy a fine tea and then not boil it—steep it just long enough to get the tea-flavor.

Get Schilling Tea and make it this way, and you have a fine rich invigorating drink at the very low cost of 1/3 cent a cup.

There are four flavors of Schilling Tea—Japan, Ceylon-India, Oolong, English Breakfast. All one quality. In parchment-lined moisture-proof packages. At grocers everywhere.

A Schilling & Co San Francisco

"WHO'S WHO" IN THE PINEY WOOD.

Camping out in the Piney Wood, Dick, and Jimmy and me—
A noise that none of us understood
Came down from a tall old tree.

Jimmy he called, "Who's that up there?"

The rest of us hollered too.
(At night a holler will keep off scare.)
The answer came back, "Who?"

That sounded fresh! Dick called,
"Who's Who?"

You'd better tell us, quick!
We're after you—we mean it, too!"
"Who? Who?" came back to Dick.

Then Dick caught up a blazing brand,
And marched off toward that tree!
(We all went with him, understand,
To see what we should see.)

And what d'you think? 'Twas a great
gray owl!

And we boys understood,
When we faced the glare of that
proud old fowl,

"Who's Who" in the Piney Wood!
—Our Dumb Animals.

SINKS AND TABLES RIGHT HEIGHT SAVE WOMAN'S TIME.

The height of a woman's kitchen sink and work tables are important factors in her well-being and well-doing. She can't do as much or as good work and feel well and strong with her sink and table so low that she has to bend over to work, or so high that she has to "reach up," as she would were they the proper height. As a general rule, 32 to 36 inches from the floor is the height for general work tables and the bottom of the sink should usually be 30 to 31 inches from the floor, the home economics kitchen of the United States Department of Agriculture suggests. However, each woman ought to find out for herself the height of the table at which she can work most easily and efficiently, and see that her work tables and sink are adjusted accordingly. Legs which are too long can be cut off, and those too short can be raised by blocks under them.

WAR-TIME-ECONOMY.

"At least the war has taught us economy," remarked ex-Secretary McAdoo recently. "I call to mind a friend of mine who works in New York, but lives in Brooklyn. He has been lecturing his wife on the gentle art of saving, and she, after deep pondering, advanced a really bright idea. Quite often the husband was not able to get home in time for dinner at night. He told his wife that he would phone her every day as to whether he could leave the office or not. Mrs. Benson was of a very thrifty disposition and the following was her solution of the problem: 'Sam, if you find that you can't be home for dinner, phone me at exactly 6 o'clock. If the telephone rings at that hour I'll know it is you and that you are not coming for dinner. I won't answer it and you'll get your nickel back.'—Chicago News.

CHECKING OUT THE SILVER.

Here is a ray of hope for those timid diners who dreaded trying to guess what all the silver implements of attack were for and who would rather have broken all ten commandments than meet a hostess' eye after picking up the wrong spoon or fork. Dame Grundy is said to have decreed that only the linen and china shall be on the table when the diners are seated. The silver is to be brought in and handed to the guest with each course.—Selected.

TO CLEAN ALUMINUM PERCOLATOR.

To the Editor: How can I clean the interior of an aluminum percolator, which is badly discolored?—Mrs. J. E. H.

Use bon ami. If this is not effective, try steel wool, which can be purchased in ten and fifteen cent pack-

DREADNAUGHT

BLAZING-AWAY-IN-COST-DEFENCE!

COST DEFENCE

Home defence—a cost defence that will continue to operate as during the war, is what our Government wishes to encourage lest we forget the lesson of profitable thrift that the necessity enforced.
What a saving goes into effect the moment you install a Dreadnaught. Kerosene is your fuel with the result concentrated in a clean gas of the highest degree. Nothing has been lost; you burn all that is in the oil, even its odor. The Burner can be installed in any stove without any changes—no plumber needed. Your dealings are with the manufacturers and sole owners at the home office, backed by a written guarantee. A circular dealing with the fuel problem and the ease with which it can be overcome, will be sent upon request—a postcard will do.

H. CLAY GLOVER CO., Inc.,
118 West 31st Street, New York

THE SELF-OILING WINDMILL

has become so popular in its first four years that thousands have been called for to replace, on their old towers, other makes of mills, and to replace, at small cost, the gearing of the earlier Aermotors, making them self-oiling. Its enclosed motor keeps in the oil and keeps out dust and rain. The Splash Oiling System constantly floods every bearing with oil, preventing wear and enabling the mill to pump in the lightest breeze. The oil supply is renewed once a year. Double Gears are used, each carrying half the load. We make Gasoline Engines, Pumps, Tanks, Water Supply Goods and Steel Frame Saws. Write AERMOTOR CO., 2500 Twelfth St., Chicago

Market Comment

1,000,000 Sheep Drowned in Argentina.

Floods in Argentina have caused the loss by drowning of 1,000,000 sheep and 100,000 cattle. Such a loss this year is keenly felt.

Canned Fruit Marked Up.

Canned fruit prices have risen from 25 to 40 per cent above the opening prices in 1918 as announced by the California Packing Corporation.

Livermore Lambs Bring \$12.

A record price for spring lambs under six months old was set this month when 1,500 lambs from Livermore averaged \$12 a head in Oakland.

Alameda Pears, \$80.

Alameda county members of the Pear Growers' Association are receiving \$80 a ton for their fruit. Most non-members are selling at \$75. The differential exists because Alameda pears ripen so quickly in the canner's hands.

A Peach of a Crop.

With an average of 3 cents a pound higher for dried peaches this season and a crop of 40,000 tons twice last season's crop, peach growers will receive more than \$7,000,000 above the total of the 1918 crop.

Bean Bags Advance.

Prices for large bean bags advanced from 15 to 16 cents this week, and the small bags from 12½ to 13½. Calcuttas on the spot are quoted at 14 cents and higher prices are being asked for later delivery.

Guarantee Wheat Price \$2.30.

The guarantee wheat price has been raised to \$2.30 per bushel at Galveston and New Orleans by President Wilson. No wheat or wheat flour may be imported or exported after July 1 except under limitations to be fixed by Wheat Administrator Julius Barnes.

State's Prune Crop Sold.

The bulk basis of 13.56 cents per pound for prunes to Association members will bring to the members approximately \$25,000,000. The organization controls about 75 per cent of the State's prune output. The entire yield is estimated at 230,000,000 pounds and is practically disposed of.

Citrus Growers' Plan Box Factory.

Options have been closed by the Fruit Growers' Supply Co. to purchase 41,414 acres of timber land in Lassen county, where they will erect a box factory. The total investment will be \$2,800,000. The debt will be financed by an assessment of 2 cents on each packed box of oranges for some years.

Farmers' Hog Sale Brings \$21.

The top price of \$21 per hundred for hogs in California outside of San Francisco and Los Angeles markets, was reached at the farmers' auction sale in Bakersfield last Saturday. Previous to that Hanford had reached its record of \$20.05 in the same week.

Watsonville Apple Crop 100 Per Cent.

"The apple crop here is still very close to 100 per cent—at any rate it is estimated about 10 per cent greater than last season," says Carrol J. Rodgers, grower and packer. The orchard run price being paid at present is about \$40 per ton, some higher sales being reported, but very few apples remain in the hands of the growers for sale.

Bumper Crop of High-Priced Melons.

Tulare county growers experimenting with cantaloupes are having fine success. Manager Kuhn of the Tulare County Cantaloupe Association, says that intensively cultivated fields will produce 400 crates to the acre, which at \$5 per crate gross, means an income of \$1200 an acre. Because of the immediate success this season officials estimate a planting of 2,000 acres next season. The Ripon section figures \$3 a crate net to the grower. In this district cantaloupe cutters are scarce and are being paid \$5 a day and board.

THE MARKET REPORTS

Figures Given Are Independent and Reliable.
Prices Quoted as Paid to Producers.

SAN FRANCISCO.

San Francisco, July 23, 1919.

WHEAT.

There is little feature to the local wheat market its strength being based principally upon the firmness of the eastern markets.

California	\$3.07½ @ 3.75
Early Bant	\$4.15 @ 4.20

BARLEY.

Prices of this grain have been marked up again this week. Buying is mostly speculative and for shipping account, the local demand showing but little increase.

Feed	\$3.15 @ 3.20
Shipping	\$3.15 @ 3.25

OATS.

While there is not a large demand for oats, the continued advance in the price of barley increased the price of red feed 20 to 25 cents this week.

Red feed, per cwt.	\$2.90 @ 3.00
Red for seed	Nominal
Black for seed	Nominal
Re-cleaned Red or Black for seed	Nominal

CORN.

In the absence of any particular demand, the price of California corn remains the same. No good Egyptian is offered and the limited supply of mulo is poor and attracts no attraction.

California	\$3.30 @ 3.50
Egyptian, choice	Nominal
Mulo	Nominal

HAY.

Receipts of hay for the past week were 1886 tons compared with 2141 the previous week. Some difficulty is already noted in obtaining cars, which indicates that a shortage of rail equipment may have quite an effect upon the future market. The demand has been fair with the result that receipts have moved readily. This is particularly true of wheat hay, most of the arrivals of which have been of No. 1 quality. Choice Quality Red oat hay is coming in quite freely. Some sales of round lots of alfalfa have been made in the country, which market has taken on considerable strength and is quoted higher. Wild oat and barley hay have both been marked up also from a dollar to two dollars a ton.

No. 1 Wheat, per ton	\$15.00 @ 17.00
No. 2 Wheat, per ton	12.00 @ 14.00
Choice Tame Oat, per ton	15.00 @ 17.00
Wild Oat, per ton	10.00 @ 13.00
Barley Hay, per ton	12.00 @ 15.00
Alfalfa, per ton	14.00 @ 18.00
do, new, 1st cutting	
Stock Hay, per ton	9.00 @ 11.00
Barley Straw, per bale	.50 @ .80

FEEDSTUFFS.

The market on feedstuffs is very firm as a result of increased demand now that green feed is becoming scarce. Quotations have been advanced on practically all offerings except alfalfa, coconut and oil cake meal, the sharpest increase being on rolled oats, which had been quoted \$56 to \$58 and is now \$60 to \$61.

Bran	Not being marketed
Shorts	Not being marketed
Cracked corn	73.00 @ 74.00
Roller barley	63.00 @ 64.00
Roller oats	60.00 @ 61.00
Alfalfa meal	33.00 @ 35.00
Coconut meal	48.00
Oil cake meal	71.00 @ 72.00
Millmix	58.00 @ 60.00
Millrun	44.00 @ 45.00

POTATOES, ONIONS, ETC.

The supply of potatoes and onions exceed the demand; shipping is light and the market on the street is weak, with a result that prices have been revised downward of certain items of stock. In green vegetables, string beans have developed weakness, the demand being light and the supply very heavy, causing prices to drop to 3 and 4 cents. Small boxes of hothouse cucumbers are not arriving any more and the larger boxes are quoted at 75 cents to \$1. Eggplant is lower than a year ago, and green corn has dropped from \$3.50 to \$4 to \$2.50 to \$3.50.

String beans	3 @ 4c
Beans	5 @ 7c

Onions new red	\$3.50 @ 4.00
Yellow	\$2.00 @ 2.50
Green Alameda	\$1.50 @ 1.75
Garlic	.15 @ .18c

BEANS.

The demand for blackeyes continued this week and the price has advanced another 25 cents. In other respects the market was quiet and quotations remain unchanged. The bean men are anxiously watching the bean market, which is showing unusual strength.

Bayos, per cwt.	\$5.00 @ 6.10
Blackeyes	\$4.75 @ 5.00
Cranberry beans	5.75 @ 6.00
Limas (south, re-cleaned)	.90 @
Pinks	\$5.50 @ 5.75
Mexican Reds	4.50 @ 5.00
Topary beans	2.50 @ 2.75
Garbanzos	11.75 @ 12.00
Large whites	\$5.85 @ 6.00
Small whites	6.00 @ 6.90

POULTRY.

The general market is steady, with receipts about equal to demand, except possibly on hens. Offerings of extra colored hens are rather light and the demand sufficiently great to cause an advance in their quotation. The rest of the list is unchanged.

Turkeys, live, young spring, lb. Nominal

Broilers, 1½ lbs. and under 33 @ 34c

do, 1½ to 2 lbs. 32 @ 34c

Fryers, 2 to 3 lbs. 34 to 36c

Hens, extra, per lb. colored 32 @ 34c

do, Leghorn 28 @ 32c

Smooth young roosters, per lb. (3

lbs. an over) 40 to 43c

Old roosters, colored per lb. 22 @ 23c

Geese, young, per lb. 22 @ 23c

do, old, per lb. 22 @ 23c

Squabs, per lb. 48 @ 50c

Ducks, young 25 @ 28c

do, old, per lb.25c

Belgian hares 14 @ 16c

Jack rabbits \$3.00 @ 3.50

BUTTER.

The butter market has been firm and active in the past week, with quotations showing an advance of 2 cents, this price today reaching the highest peak for some little time. Government orders, together with some outside demand is causing a temporary shortage of the finer grades. Some butter has been extracted from storage to meet the local demand. Undergrades are plentiful.

Special Deciduous Market Report

(Written for Pacific Rural Press by J. L. Nagle.)

Sacramento, Cal., July 21, 1919.

The general high level of the past week in practically all markets remained unchanged over the week previous, though the prices on Bartlett's declined, due to a freer movement of the stock and under heavier offerings. Prices, however, were in all instances very satisfactory and indications are that though there will be this week and part of next a somewhat lower market on pears on account of the very heavy receipts anticipated, we do not look for any noticeable slump on account of the unusual demand and the opportunities for export. This last factor will unquestionably stimulate seaboard markets.

The shipments and receipts of plums are much lighter than the week previous and will be considerably less from now on, the market on blue varieties showing a sharp advance, and we look for a high level to be maintained for the next three or four weeks.

Owing to a falling off of shipments of peaches from Southern states and on account of the keen demand on the part of the consumers for fruit for canning, California peaches of all varieties advanced generally in all markets, and we predict that the California peach crop now rolling and to be harvested within the next three weeks, will be disposed of to good advantage.

On account of the unusual quality, size, and color of the Malaga grapes that have been forwarded and sold to date, the demand far exceeds the supply and though shipments of

the above varieties from the Imperial and Coachella Valleys will be finished this week, and though the last cars will undoubtedly come in competition with early shipments from the San Joaquin Valley, we estimate that the prices received will be the highest recorded in the history of the State. Inquiries are already numerous and active for Tokays, which, however, will not be ready before thirty days, but there is no question that a strong market on table grapes of good quality and sound arrivals will be maintained throughout the season.

Averages for the week:
NEW YORK—Bartlett Pears, \$5.13; Wilders H-B, \$2.98; Malaga Grapes, \$4.18; Thompson Seedless, \$3.76; Hale Peaches, 77c; St. Johns, 85c; Climax Plums, \$1.70; Santa Rosa, \$1.82; Burbank, \$1.58; Tragedy, \$1.82; Botan, \$1.40; Wickson, \$2.40; Koley, \$3.30.

CHICAGO—Bartlett Pears, \$4.80; Triumph Peaches, \$1.16; Hales, \$1.09; St. John, \$1.91; Crawford, \$1.55; Malaga Grapes, \$4.08; Thompson Seedless, \$4.50; Tragedy Plums, \$2.19; Burbank, \$2.30; Climax, \$2.09; Santa Rosa, \$2.42; Calif. Blue, \$2.05; Botan, \$1.87; Wickson, \$2.51.

BOSTON—Bartlett Pears, \$5.38; Comets H-B, \$2.60; Wilder H-B, \$3.05; Triumph Peaches, 77c; Hales, 78c; St. Johns, 98c; Malaga Grapes, \$4.53; Thompson Seedless, \$3.10; Santa Rosa Plums, \$1.98; Climax, \$1.48; Tragedy, \$1.84; Calif. Blue, \$1.80; Burbank, \$1.43; Wickson, \$2.81; Formosa, \$2.60; Abundance, \$1.35.

Firsts	48½	48½	48½	51½	51½	51½

EGGS.

Monday the egg-market showed an advance of a cent over Saturday's quotation, under the influence of light supplies, several carloads having been shipped East during the previous week and production having dropped off. Tuesday to market seemed bare of supplies and it looked as if the shortage might be continued, so there was active bidding, bringing the price up 2½ cents. Today the demand eased off on increased supply and the price receded a cent.

Th. Fri. Sat. Mon. Tu. Wed.

CHEESE.

The local supply of cheese was greatly augmented with the arrival of 352,000 pounds on Tuesday of this week, this being the largest day's receipts in a year or more. Of this amount the greater part was Oregon cheese; to be exact, 305,000 pounds. The other 47,000 pounds were made up of different varieties. The California product, in which the trade is especially interested, continues in short supply, with prices firm.

Extra California, flats, per lb. 30½c

do, Firsts 31½c

California Y. A. 32½c

Oregon Y. A. 33c

Oregon Triples 37½c

Monterey cheese 22½ @ 24c

FRESH FRUITS.

Trading on the fruit market continues quiet active, with but few changes in prices. Plums are a little cheaper on the strength of increased supplies, but peaches and figs are higher. Royal Anne and white cherries are entirely gone, the only offerings of this fruit being a limited amount of blacks. Turkey melons are coming in to take the place of Merced and Imperial arrivals.

California apples	\$3.00 @ 4.00
Northwest apples	3.00 @ 4.00
do, New Red Astrakhan, lug	75c @ \$3.25
do, California, boxes	\$1.50 @ 2.00
Peaches	40 @ 85c
Apricots	\$1.50 @ 1.75
Plums	\$1.00 @ 1.25
Figs	50 @ 65c
Strawberries, chest	\$11.00 @ 14.00
Raspberries	\$12.00 @ 15.00
Loganberries	\$8.00 @ 10.00
Blackberries	\$8.00 @ 12.00
Currants, chest	10.00 @ 13.00
Cherries	
Black, bulk	15 @ 18c
Cantaloupe, Standards	\$2.50 @ 3.00
do, Ponies	2.00 @ 2.50
do, flats	1.00 @ 1.25
Watermelon, lb.	2 @ 2½c

CITRUS FRUITS.

Citrus fruits remain about the same, both in supply and demand, with no change in prices.

Oranges, Valencia \$3.50 @ 5.25

Lemons, fancy \$7.00 @ 7.50

do, choice 6.00 @ 7.00

do, standard 5.00 @ 6.00

Lemonettes 4.00 @ 5.00

Grapefruit 3.50 @ 4.25

DRIED FRUITS.

The market is strong, with a heavy demand for dried fruits, notwithstanding the high prices. Peaches are in particularly strong demand. Prices have been advanced for the 1919 peach crop by the California Peach Growers, Inc., for domestic and foreign trade; September, October and November shipment, sellers' option; guaranteed against decline until January 1, 1920, as follows: Apples and pears have been marked up ½ to 1 cent.

Apples 19½ @ 20c

Pears 10 @ 21c

Peaches 16½ @ 18c

Apricots 23 @ 29c

Prunes 18 @ 19c

Figs, Adriatic 14 @ 18c

do, Calmyria 15 @ 20c

RICE.

An upward price tendency is shown in the rice market, attributed to increased export demands accompanied by steady shipments of comparatively small amounts for home consumption. The 1918 crop of California rice is practically exhausted.

HONEY.

There is little change in the honey situation, receipts of new crop being light as yet, and prices firm. All indications point to a heavy production this year. No new comb honey has arrived, but it is expected to put in an appearance within the next two weeks. Water-white orange blossom 18c

White to water-white sage (subject to production) 18c

Light Amber Mountain (Sage-Buckwheat) 14c

Light Amber Alfalfa 11 @ 13c

WOOL.

The tendency of the wool market is strongly upward. European countries are desperately in need of clothing of all grades, and are eager bidders for wool supplies, especially of the cheaper kinds, thus narrowing the spread between fine and coarse wools. The quotations below are furnished by a large wool-buying firm in San Francisco.

Mendocino 30 @ 35c

Humboldt 40 @ 42c

Sacramento Valley 30 @ 35c

San Joaquin 18 @ 20c

HIDES.

The hide market shows a strong tone, and prices on both packers' and country hides are steadily advancing.

No. 1 wet salt kip, 15 to 30 lbs. 20c; No. 2, do, 37c; No. 1 wet salt calf, trimmed, 70c; do, untrimmed, 65c; No. 2 calf, 2c, lb. less.

Wet salted horse hides—No. 1 large, skinned to hoof, \$7 @ 10; do, medium, \$4 @ 6; do, small, \$14 @ 3.50; No. 1 colts, 50c @ \$1.

FEELS.

Pelts—Long wool, 9 to 12 months' growth, \$2.50 up; medium, 6 to 9 months, \$1.50 @ 2.50; short, 3 to 6 months, 80c @ \$1.50; shearings, good, 1 to 3 months, 25 @ 75c; do, shaved or damaged, 20c; lambs, large long wool, \$1.25 up; lambs, small, 25c @ \$1; milk lambs, 5 @ 25c.

LOS ANGELES.

Los Angeles, July 22, 1919.

BUTTER.

Butter advances another 1c since reported last week. However, the demand continues to be good. Receipts are much lighter than a week ago, and for the week, 337,800 lbs. California extra creamery 57c do, prime first 55c do, first 54c

EGGS.

Pullet eggs advanced 1c since last week's report. Other prices remain unchanged and selling fairly. Receipts lighter; for the week, 927 cases. Fresh ranch, extra 51c do, case count 50c do, pullets 46c

POULTRY.

Broilers show an advance of 1c while prices declined 2c since quoted a week ago. Receipts reported to be very good and the demand holding up fair. Broilers, 1 to 1 1/2 lbs. 25c Broilers, 1 1/2 to 1 3/4 lbs. 29c Fricars, 2 to 3 lbs. 30c Roosters (soft bone), 3 lbs. and up 30c Stakes and old roosters, per lb. 16c Turkeys 34 to 40c Hens 24 to 30c Ducks 23 to 26c Geese 25c

FRUITS.

Berries reported to be very dull. Peaches now listed and selling for 3c and 5c the lb. Plums on the market and meeting with good sale. Apples also appearing on this market and the demand for them is very good. Cherries not quoted because they are about off the market for this season. Apples, new crop selling at 5c and 6c. All fruits in very good demand.

We quote from growers: Apricots, lb. 5 to 7c Peaches 4 to 5c Strawberries—30 basket crates, fancy 4.25 to 4.50 Poor to choice 3.75 to 4.00 Blackberries, case 30 boxes 3.75 to 4.00 Raspberries, case 30 boxes 3.50 to 3.75 Loganberries, case, 30 boxes 3.25 to 3.50 Plums, Santa Rosa 6 to 7c do, Tragedy 6 to 7c do, Satsuma, lb. 6c do, Burbank, lb. 5 to 6c do, Sugar, lb. 6 to 7c do, Nectarines, lb. 7 to 8c Apples, White and Red Astrakhan, lb. 5 to 6c Grapes, Thompson's Seedless, lb. 9 to 10c do, Malaga, lb. 8 to 14c

VEGETABLES.

Potatoes and onions, dull and lower. Beans also lower and dull. Corn sharply lower, but demand is good. Green peppers now coming in quite freely, and lower. Tomatoes selling well. Casabas now on the market and selling well. All melons reported to be good sale. Receipts continue good. Potatoes, new, per cwt. \$2.00 to 2.25 Onions, New Red, per cwt. \$2.65 to 2.75 do, Stockton yellows, per cwt. \$2.65 to 2.75 White silver wax, cwt. \$2.75 to 2.80 Cabbage, per 100 lbs. 75c to 1.00 Rhubarb, per 30-lb. box 75c to 1.25 Summer squash, lug. 35c to 40c Peas, per lb. 8 to 10c Kentucky Wonders 3 to 4c String Beans, wax 3 to 4c do, Green 2 to 3c Tomatoes, lug box \$1.50 to 1.75 Cucumbers, local, lug box 15c to 25c Lima Beans, local, lb. 10 to 12c Cantaloupes, shipped in, Stand. & Pony crates \$1.50 to 1.75 do, home-grown, pony crate \$1.75 to 2.00 Watermelons, 100 lbs. 1.00 to 1.25 Lettuce, crate 70 to 90c Corn, lug box 35c to 40c Peppers, Bell, lb. 15 to 18c do, Chile, lb. 7 to 8c Casabas, lb. 2 to 2 1/2c

DRIED CHILE PEPPERS.

This market is reported to be very dull. California 12 to 14c do, Mexican 20 to 22c

BEANS.

There is little doing in this market. All prices firm and unchanged since last week's report. Limas per cwt. \$8.00 Large white, per cwt. 8.50 Pink, per cwt. 8.50 Small white 8.25 Blackeyes, per cwt. \$3.75 to 4.50 Tepary, per cwt. \$2.00 to 2.50

HAY.

Prices are higher in this market since last week. Demand is fairly good for all choice offerings, while receipts are somewhat light. We quote f. o. b. Los Angeles: Barley hay, per ton \$18.50 to 21.50 Oat hay, per ton \$21.50 to 23.50 Alfalfa, Northern, per ton \$20.00 to 21.00 Alfalfa, local, per ton \$21.00 to 23.00 Straw, per ton 9 to 10.00

ALFALFA.

The following quotations on Alfalfa Hay, f. o. b. Los Angeles, are furnished by the Alfalfa Growers of California, Inc., 525 Central Bldg. No. 1 Dairy \$26.00 to 27.00 Standard Dairy \$23.00 to 24.00 Standard Alfalfa \$21.00 to 22.00 Stock Alfalfa \$12.00 to 17.00

DRIED PEACH PRICES TO THE TRADE.

Following are the prices of dried peaches for domestic and foreign trade published by the California Peach Growers, Inc., on July 10. These prices are guaranteed against decline on the part of the association until January 1, 1920:

On Yellows: Standard, 14 1/2 cents; Choice, 15 1/2 cents; Fancy, 16 1/2 cents; Extra Fancy 17 1/2 cents; Slabs, 14 1/2 cents. On Muirs: Standard, 15 cents; Choice, 15 1/2 cents; Fancy, 17 1/2 cents; Extra Fancy, 18 1/2 cents. For "Practically Peeled" add 1 1/2 cents a pound (any grade). Above prices are all "bulk prices."

For packing in 50 pound or 25 kilos boxes add 1 cent a pound.

For packing in 25 pound or 12 1/2 kilos boxes add 1 1/2 cents a pound.

For packing in 10 pound boxes add 2 cents a pound.

Bakers' special "Practically Peeled," 16 1/2 cents per pound, bulk basis.

In accordance with their policy to eliminate speculation they will sell, at this time, only a limited quantity to any one buyer. (July 10.)

LOS ANGELES TRACTOR DEMONSTRATION.

Secretary R. M. O'Neill, of The Tractor, Engine, and Implement Dealers' Association of Southern California, makes the announcement that the location for the fourth annual demonstration to be held in Los Angeles September 16-21 inclusive, will be on the corner of Melrose and Crescent avenues. The Field Committee, in charge of securing the land, have, through the courtesy of George Allan Hancock, been granted the privilege of using this tract. The location is easily accessible, the interurban car lines passing through the tract.

Student workers in the canneries of Santa Clara Valley last year made from \$20 to \$25 a week—both boys and girls. They hailed from both Universities, from the San Jose State Normal and from the High Schools. Their services will be again in strong demand this year. Thousands of extra workers will be needed by the new and the enlarged canneries and packing houses this season, as well as in the orchards and vineyards.

The appropriation by the Ventura County Board of Supervisors for establishing an Insectary in their county on the recommendations of H. S. Smith and A. A. Brock, the County

Horticultural Commissioner, was a move that will be appreciated by the growers. It was urged on the Board by Mr. Smith on results already obtained. Mr. Brock is a trained entomologist and is very keen on the new work entrusted to him. Money spent by a fruit county for the advancement of horticulture is a benefit to the whole county and the Ventura county move looks like a step in the right direction.

MISCELLANEOUS.

REMANUFACTURED PIPE.

All sizes standard pipe and wrought iron screw casing. All kinds of fittings. Guaranteed good as new. Write for prices. Weissbaum Pipe Works, 160 Eleventh street, San Francisco.

FOR SALE—Ventura Bean Thresher, Junior No. 2. Equipped with ten-horse-power gas engine. New last season. Used only very short time. Best of condition. One thousand dollars takes it. Phillips & Johnson, Box 93, Mendota, Calif.

ALL SIZES OF PIPE and screw casing, both new and second-hand, dipped and undipped. Guaranteed. Prices right. Shecter Pipe Works, 304 Howard St., San Francisco.

MADE OF REDWOOD, Hawley's Perforated wooden well casing, the best and cheapest well screen made. Send for descriptive circular. G. M. Hawley, La Mesa, California.

PATENT ATTORNEYS.

WEBSTER, WEBSTER & BLEWETT, Savings and Loan Bldg., Stockton, California. Established 50 years. Send for free book on patents.

CORN HARVESTER—One-man, one-horse, one-row, self-gathering. Equal to a corn binder. Sold to farmers for twenty-three years. Only \$25, with fodder binder. Free catalogue showing pictures of harvester. Process Corn Harvester Co., Salina, Kan.

CO-OPERATION (not operated for profit) reduces living expenses. Particulars and catalogue from Co-operative League, Commercial street, San Francisco.

CROLEY'S BALANCED HOG FEED—The cheapest feed to fatten hogs. Write Geo. H. Croley, Townsend Sts., San Francisco, Calif.

BEEES FOR SALE—Golden Italians in patent hives. John G. Mee, St. Helena, Cal.

COUNTRY LANDS.

\$16,000.00—80 acres in Honey Lake Valley, Lassen county. All under cultivation. Alfalfa seed, hay, and grain; under good irrigation system. Good improvements. 2 miles from postoffice and bank. School, 1 1/4 mile; high school, 15 miles; S. P. depot, 3 miles. Daily trains. A good buy. Cash only. Have other business prospects. Write to Box 280, Standish, Lassen Co., Cal.

FOR SALE BY OWNER—18 acres improved, about 5 miles south of Williams, 11 miles southwest of Colusa, county seat of Colusa Co., near State Highway. Alfalfa. Abundance of water for irrigation. Ideal poultry and dairy ranch. Address C. A. Hanson, Williams, Cal.

FOR SALE—My Equity of \$3700 in 40 acres alfalfa land. 5 miles from Manteca. Address Wm. Robertson, 869 Fulton St., San Francisco.

WANTED TO EXCHANGE—Improved ranch in Tulare county for stock ranch in northern California. Address 154 So. C St., Tulare, Cal.

Special Livestock Market Report

San Francisco, July 23, 1919.

CATTLE—There is a wider spread in the cattle market than has existed for some time—due to a stronger demand for prime steers and a heavier glut of the poorer grades of cattle to save high-priced feeds.

Steers—Grass Steers, No. 1, weighing 950 1100 lbs. 10 to 10 1/2c Grass Steers, No. 1, weighing 1100 to 1300 lbs. 9 1/2 to 10c Grass Steers, thin 6 to 7c Grass Cows & Heifers, No. 1 8 to 8 1/2c Grass Cows & Heifers, 2nd qual. 6 1/2 to 7 1/2c Grass Cows and Heifers, thin 4 to 5 1/2c Bulls and Stags, good 4 1/2 to 5 1/2c do, fair 4 to 4 1/2c do, thin 3 to 3 1/2c Calves, light weight 12 1/2 to 13c do, heavy 10 to 11c

SHEEP—The sheep and lamb market is strong, and although packers' quotations are unchanged some outside sales indicate the pressure on buyers to pay advanced prices in order to obtain supplies.

Lambs, yearling 10 to 10 1/2c do, milk 13 to 13 1/2c Sheep, wethers 9 1/2 to 10c do, ewes 7 1/2 to 8c

HOGS—The hog market is still buoyant, and the late unprecedented prices still hold, except as to the heavier weights, which have sagged slightly.

Hard, grain-fed, 100 to 150 19 1/2c do, 150 to 200 20c do, 250 to 300 19 1/2c do, 300 to 400 18 1/2c

Los Angeles, July 21, 1919.

CATTLE—All prices remain the same as reported last week. It is still very dull in this market.

Per cwt. f. o. b. Los Angeles: Beef, steers, 1000 to 1100 lbs. \$9.00 to 10.50 Prime cows and heifers 7.50 to 8.50 Good cows and heifers 7.00 to 7.50 Canners 5.00 to 5.50

HOGS—This market quoted higher since last week's report. Receipts light. Demand is only fair.

Per cwt. f. o. b. Los Angeles: Heavy average 275 to 350 lbs. \$15.50 to 16.50 Heavy average 225 to 275 lbs. 17.50 to 18.00 Light 1900 to 20.00

Rough docked 20 lbs. piggy sows 40 per cent.

SHEEP—All prices stationary. The market is steady and firm with fair demand. Prime wethers \$ 3.50 to 9.50 Prime ewes 8.00 to 8.50 Yearlings 8.50 to 9.50 Lambs 12.50 to 13.50

PORTLAND LIVE STOCK.

Portland, Ore., July 22, 1919.

CATTLE—Strong; receipts, 32. Steers, best, \$10.00 to 11.50; good to choice, \$9.00 to 9.50; medium to good, \$8.50 to 9.00; air to good, \$7.75 to 8.25; common to fair, \$7.00 to 7.50; good to choice, cows and heifers, \$8.00 to 9.00; medium to good, \$7.00 to 7.25; fair to medium, \$4.50 to 5.50; can-

Amazing Results from Rural Press Advertising.

I have hardly been able to credit my eyes with the number of answers my ad brought during the first week. Although it is too early to determine the final results, I believe that the entire 35 Duroc pigs will be sold before the end of the month. The Rural Press certainly brings Big Results.

GEO. L. HORINE, Winton.

Take it in the Car

Think how your car shortens those trips to town!

Going or coming—carrying any one of the hundred and odd things you

have to carry, how much it means to you in time saved, alone!

Give it tires that will vouchsafe its greatest usefulness and most economical operation.

Experience has taught hundreds of thousands of folks—both in the cities and on the farms—that United States Tires are good tires; the best tires they can buy.

Last year, when thrift was a necessity and dependability vital, United States Tires showed the remarkable supe-

riority that has always marked their performance.

That is one reason why the 1919 sales of United States Tires are far beyond any previous demand.

Another big reason is this:

There are five separate and distinct types of United States Tires—among them tires that will meet—and meet exactly—any existing need for tires. This means greatest economy, longest mileage and most satisfaction all 'round.

The United States Sales and Service Depot Dealer in your neighborhood will gladly point out the tires that will serve you best. Let him help you.

Forecast of California's Fruit Harvest

Written for Pacific Rural Press by John J. Fox.

A MONTH FROM NOW the major portion of the orchards and vineyards of California will be harvesting their peak loads. These will include seedless raisins, certain varieties of peaches, pears, prunes and apples. The markets of the world are waiting with the price for all the fruit we can produce.

The large increase in the cannery industry has given an added impetus to the general movement. The merchandising of so large a portion of our crop is one more "division" that is engaged in its wholesale distribution—coaxing an ever-growing consumption, by the delicacy and excellence of the finished pack. These canneries have absorbed a very large amount of labor, but we cannot say it has taken it from the field. For war conditions have enlisted the services of thousands of women and girls, who have learned how to handle fruit and become efficient units in this big man's game. They have learned the peculiar pleasure of working in a body, and above all, realize the benefits of a generous pay-envelope—the proceeds of their own industry. The women who have undertaken work in the fruit harvesting have helped and are helping in no small measure to ensure a fullness of success in the great harvesting campaign of 1919.

Crop Estimates Based on 100 Per Cent Average.

There has been no material change in crop estimates since our last report in spite of sunburn—except in the case of bush berries.

culminating about July 5 and 6, and Lawtons suffered some injury. Bush berries for the State will be short.

Pears perhaps surpass earlier estimates and show better all the time. There was quite a drop through the month, but generally speaking, it has been on heavily laden trees, and will therefore not materially reduce the tonnage even in these orchards. This will be a record year for pears—110,000 tons, worth \$8,000,000, as compared with 100,000 tons last year.

Peaches will measure up to early estimates. It is possible that some of the canning peaches may run small before they are all harvested, on account of shortness of water, but most growers were able to give a good irrigation before the ditches were dry, and a very large number of canning peach growers have supplemental pumping plants to keep the ball rolling. The crop of 450,000 tons should be worth \$27,000,000.

Apricots have come up to our last month's estimate—85 per cent of a crop. This is far above spring estimates. The quality of the fruit has been excellent wherever proper thinning was done. One hundred and fifty thousand tons for the year would be worth about \$10,500,000.

Plums have shown up remarkably well, both in quality and yield and eastern shipments have been heavy. The tonnage will probably show an increase of 10 per cent over last year when cannery returns are available, worth perhaps \$3,500,000.

Prunes will be well up to last month's estimate of 125,000 tons from

The Midas touch of California's sunshine on our fruit orchards brings golden returns. Hundreds of acres of dry-yards such as this, full of trays of peaches and prunes, will soon be a familiar feature in California's entire deciduous fruit section.

Citrus Fruits.—Show up rather better than they did a month ago. In Los Angeles county Navels are much better than last year, with Valencias keeping pace with them. Oranges may reach to 20,000,000 boxes this year, as compared with 17,858,939 last year. At \$2.50 net to the grower this would give \$50,000,000. The return on lemons gross last year was \$19,000,000. This may be duplicated on increased acreage. The Butte county section shows "good" wherever water has been applied in time, as does the Sacramento valley. The Porterville district reports an improvement in condition and so does Southern California.

Olives are a very uneven set—poor in San Diego and some of the valley sections, fair in the heaviest producing districts and good in smaller acreages. Putting a full crop at 23,000 tons, this year's crop may run up to \$1,900,000 in value—say 12,500 tons.

Raisin grapes will be fully up to earlier estimates—200,000 tons, allowing for increased acreage, in spite of some shot grapes and a little injury here and there from sunburn. Less leaf damage than last year is noticeable. Average crop for last 10 years is about 100,000 tons. Last year it was 167,000, and this year may reach 200,000 tons, worth perhaps \$32,000,000.

Berries.—Strawberries have given a good average yield. Logans and Mammoths in the Sebastopol district were badly damaged by a long hot spell,

all appearances worth over \$31,000,000. Considerable loss is reported from northern and interior sections from sunburn and subsequent drop—chiefly on thinner land and orchards suffering from lack of moisture. But the estimate still stands on account of ever-improving quality. There has been some splitting even in unirrigated orchards—unaccountable, but not serious.

Almonds are looking better in the important sections than earlier. In two or three districts we have visited there will be a loss in quality and tonnage from mites, but in the more important sections growers have been spraying and dusting assiduously and the results of their labors show in the condition of the orchards. Our last month's estimate of 75 per cent is raised to 80 and the young acreage may better this. Last year's crop was 5,100 tons, worth \$1,860,000. This year's crop will probably exceed this.

Walnuts.—A full crop and then some. Trees have been dusted and well cared for. Much interest is being taken by all fruit men in these dusting operations and their results. Twenty-five thousand tons of nuts, worth \$15,000,000, is not an excessive estimate for the year.

Apples still show up well and will probably show a full crop on account of the increased bearing acreage in Southern California. The crop may amount to 7,500,000 boxes, worth \$9,500,000 in the lug.

Figs.—Full crop, hard to estimate; may bring \$4,000,000 in 25,000,000 lbs.

EDITORIAL.

ON SEA AND SHORE.

AS WE write on Tuesday the Great American Peace Fleet is steaming grandly northward from Panama, and will be wafting its influence eastward over the troubled republics of Central America, and possibly peace in the air may distill some peace on earth, where the need of it is always imminent. All this week and part of next the evening's and the morning's suns will set and rise upon more than two hundred craft with their screws continually churning and their rudders set for the northward and westward. We presume the orders are to proceed rather slowly off the coast of Mexico—certainly the more suggestions of the desirability of peace which can be conveyed to that country by wireless the less may be the need of imparting such suggestions in some other way. With a fleet of aeroplanes shooting suggestions from the Texas border and a sea-fleet hydro-planing them from the Pacific, our restless sister republic ought to get training in the joys of peaceful good behavior. That, however, is only incidental.

We have it in mind to write this week of things on shore, because when the glory of the sea rises in the west upon San Diego on August 7 terrestrial affairs will vanish from California sight and thought. For a fortnight, or until the great fleet will emerge from the Golden Gate on August 22 to continue its northward progress, all California will be on the waves until everything upright, from the summits of Whitney and Shasta to the blazing crests of the electroliers along our highways, will be veering hither and yon with the pangs of sea-sickness. The crisis of our State-wide attack will arrive when President Wilson (perhaps) parachutes from an aeroplane to the bridge of the flagship and enters the Golden Gate on August 15—the new Columbus discovering the west of America and taking possession of it in the name of the United States! And, of course, while such marine wonders are transpiring California will have no thought of the things of the shore—therefore the few things which we desire to say before our eyes are filled with brine and our interiors with tumultuous emotions must be said in this issue of our journal.

SAN FRANCISCO: BUY THOSE SHIPS!

Fortunately, there has transpired in this city since our last issue an event which will serve as a gang-plank between sea and shore so that we can get to terrestrial affairs without rolling in the breakers. This event had to do with the significance to our industries and our commerce which a new era of marine activity potentiates. It is very important that, before we lose our heads and hearts in enthusiasm over the great spectacle which is approaching, we should think about what we should do to realize the benefits which the present turning-point in our marine relationships can confer if we befit ourselves to seize them. It is really humiliating to remember how blind we have been in California to the upbuilding of our own marine industry for many years past. Why have we been

content to develop and equip our ports so that the marine fleets of other countries could discharge and gather cargoes in them? Why has this country made it so hard for American ship owners to operate ships that they sold them to foreigners to conduct the carrying trade which our productions required and our overland railways invited for continent-crossing? Have we not been a blind, blundering nation of land-lubbers, content to dig and delve, manufacture and trade, that the people of other lands could be enriched by floating our people and our products back and forth across oceans of whose length of coast lines and multitude of ports and harbors ours were greater than any single country possessed? These are surely things which should be seriously considered and the great spectacle of the fleet in our waters, which will awaken interest in marine affairs greater than ever before aroused, should be viewed in relation to our future in both land and water enterprises. The questions involved are not within our knowledge and capacity for discussion, nor do they belong to our journalistic repertoire, but they appeal to us as irremovable from the symmetry of our industrial development, and we conceive it to be a duty on the part of agriculture to assist in awakening interest in their serious consideration by those who give their lives and money to trade and transportation. Every one owning and operating agricultural lands and looking forward to individual prosperity from food production should make his influence felt for the upbuilding of California's carrying activity and equipment.

To present the matter very concretely and without farther attempt at argument, let us state that last week in this city there was held a meeting of business men of San Francisco and Los Angeles for the purpose of hearing an address on our duty to water traffic by J. H. Rosseter, a prominent shipping man of San Francisco who has recently been serving the United States as Director of the U. S. Shipping Board. As Mr. Rosseter is an old Californian and expects to be soon again, he could speak more plainly than a stranger might and with keener local interest also. These paragraphs from his address will be interesting to remember:

"We have always been proud of San Francisco's importance as a shipping center, but before the war at all ports on the Pacific Coast the companies really engaged in operating ships could be counted on the fingers of one hand.

"You must realize the necessity and importance of doing things for yourself instead of relying on Government aid, if you are to develop as a great shipping seaboard. We are coming to a time now when I hope, in the wisdom of Congress, private people will have an opportunity of getting back what they own. Communities everywhere will have a chance to purchase ships, and when that time comes San Francisco should be ready.

"The Government now has nine ships, which it expects to be through with at the end of next year, all of which are larger and superior to either the Mongolia or Manchuria. Practically every community in the country is trying to secure those ships. But, as yet, I have not heard a demand for them from San Francisco. Now is your time to step in; clamor for them and you may get results. Nothing can be gained by sitting still and looking on."

Think of it: ships built in San Francisco bay at a rate which beat the record from Noah's ark to the present day and yet waiting for the government or foreign owners to serve our trade! Are we not typical tailors, as the proverb goes: covering the legs of all comers—without thought of the gaps in our own rear elevation.

THE FRUIT GROWERS BOX THE COMPASS.

We are all the more ready to slam the great windjammer, "Metropolitan California," for trying to slide down the ways toward great depths of prosperity with a brass band on her deck and her sea-cocks all open, because the fleet "Rural California" is not being launched that way. Practically all our special agricultural industries are advancing to ownership of their own outfits of warehouses, packing houses, manufacturing plants, and everything else that is needed to do their own business with their own outfits. All this makes for independence, self-control and safety in the prime business of production and serves as a basis for extension of production which otherwise might place the producer at the mercy of all who furnished supplies and handled products. Take a concrete instance of this, which is perhaps the great-

est out-reach yet attained by one of our fruit-growing specialties: The Fruit Growers' Supply Company, which is a subsidiary of the Fruit Growers' Exchange (controlling something like 70 per cent of our citrus fruit products), has just purchased a tract of 41,414 acres of timber land in Lassen county, and will erect a lumbering plant and box factory, with a total investment of \$2,800,000. The land is covered by 689,986,000 feet of pine timber and 283,292,000 feet of fir, which at the agreed price will cost the orange growers about \$1.25 per thousand as it stands in the trees. It is figured that the twenty million or more of citrus fruit boxes per year which the growers will require will cost them 15 cents as against 20 cents, the present wholesale price in California, and 30 cents, which is paid by the Florida citrus growers. We give the figures as we find them for purposes of illustration of the fact that our fruit producers can manage long-distance business transactions. The undertaking is financed by the Los Angeles banks and the necessary debt will be covered by an assessment of two cents per packed box of fruit for a period of years. When this debt is thus easily wiped out it may be a question whether the members of the association will be a group of orange growers owning a forest and lumber plant or a group of lumbermen owning orange groves for recreation purposes. It does not matter how it comes out, for they will be the same people who had the sand to rule their own affairs. To the reader who may think the scheme visionary it should be added that these growers who now own their own timber and box factory are the same far-seeing men who have for several years been making money by making their own boxes in a hired mill and paying for the timber they used at stumpage rates, and they now proceed to ownership on the basis of successful experience. This fact has probably much to do with the willingness of the banks to capitalize their proprietary undertaking.

Now if farmers can do this, and it is perhaps more picturesque but not greater in obligations than other things which our producers are doing, why do not our city businessmen pool their idle money and buy the ships which San Francisco should own to give her a look-in of her own in this great ocean traffic on the Pacific which everyone knows is coming? Mr. Rosseter is right when he tells our metropolitan people that "nothing can be gained by sitting still and looking on" and shipping a few things now and then in the "marus" which our Oriental neighbors kindly send to our ports! Unless they get busy it may be necessary for our fruit growers to truck down a fleet of ships from their Susanville forest!

RAILROAD BUILDING RESUMED.

We seem to be running on a transportation line this week, so it is fitting to announce that railroad building in California is to be resumed. It is not a very long road, it is true, but it will do for a start, and it is a whole lot better than we have had for some time. The director of the government railways said the other day that we were going to have a great outbreak of overland travel, and people ought to be patient, because the roads needed refitting from the track upward; there had not been a new passenger car built for four years, and everything was in short supply. The government operation has no doubt secured a lot of patriotic service without which Hindenburg might have pushed his line westward over the Rocky Mountains, and we are fortunate of course in having prevented that catastrophe. But now that that has been accomplished and as we have all been taxed one way or another to meet a wage-scale which would keep railroad hands on their jobs, there ought to be now a progressive and developing policy reinstated in our railway management as soon as possible. The announcement from the executive board of the Southern Pacific Company in New York city is that a branch line eighteen miles long will be built as a spur to the Sacramento-Knights Landing-Marysville line through the center of the Sutter basin within sixty days, to handle this year's rice and bean crops. This action seems to have been entered upon by the eastern directorate on the recommendation of Vice-President Paul Shoup, and those who know Mr. Shoup's long continued interest in making the railway serviceable to agricultural development will not be surprised at the

source of this movement. Now that the Western Pacific has been unscrambled and as all roads will soon be set free to do their level best under the regulation of the California railway commission, we shall expect soon to see extension, re-equipment and electrification—all of which are necessary to make all these grand arteries flow full again of the newer life in which California is now abounding.

MAKE WAY FOR CALIFORNIA.

And being short of ships and of cars is not all of it, for we seem to be shy of barges. There has been a tremendous activity in our flouring mills and plenty of wheat to grind, for much Australian wheat has come to this port, and now Europe wants that flour, but it is said to be stuck in the warehouses for lack of barges to bring it to shipping points. We surely need more water craft on our rivers as well as ships of our own on the sea. Trucks are doing tremendous service in making up for shortage of trains, but until we get hydro-trucks or more railways paralleling our rivers we are likely to be chuck-a-block every time barges get short or water too low to float them. The transportation facilities on highways, railways and waterways are bound to be short now that settlement and development of river lands is proceeding so rapidly. Even garlic, which ought to be strong enough to fly away with itself, seems to have difficulty in moving. Last year's shortage, which pushed the price up about 800 per cent, made all who understand growing this fragrant esculent active to increase the product. They have plenty this year, and shippers to the East and Europe are fighting for it, for they see a great gamble in garlic, now that depressed Europe and prohibitive America seem to require so much effective stimulation. California needs more capacious outlets to the world at large. It seems to be up to the Great Fleet or to the garlic crop to blast them out!

QUERIES AND REPLIES

By the Editor.

Inquirer Must Give Full Name and Address.

Pollination or What for Garden Trees.

To the Editor: I have a Burbank plum tree planted in 1909. For several years it bore profusely. Then the aphid began to infest it. For the last three years it has borne very lightly. This fall I shall irrigate well and apply stable manure. Will that be sufficient to bring it back into bearing? At the present time it is growing well and appears healthy. I also have a Tragedy prune, also planted in 1909, which though strong-growing and healthy has never borne. Is it due to lack of pollination? If so, could I not graft a few of the branches with some variety which would fertilize the blossom? I also have a Black Tartarian and a Royal Anne cherry tree. The Tartarian bears finely but the Royal Anne does not. What can I do for it?—A. M., Oakland.

Are all the plum trees which were near Burbank when it was bearing well still in place? It will be a good plan to manure and irrigate the tree for the Oakland soils are not over-rich, but if a tree is looking healthy and growing well, there is probably a lack of pollination. We should graft in a Climax. The Tragedy can be brought around all right by grafting in Clyman. Royal Anne can have better pollenizers than Black Tartarian. We have a Royal Anne which bears regularly and the only other cherries in the garden are Purple Guigne and Black Tartarian. Since suspicion of impotency has attached to the latter we have credited Royal Annes profligacy to the Guigne. In experiments at the University Farm, Pontiac has proven the best pollinator for Royal Anne. Governor Wood has done well in other places. We should graft in Governor Wood as a superior home garden cherry.

Pasture on Low Land.

To the Editor: I have some overflowed land that I wish to put into pasture. There is no irrigation. What grasses can I use to be sowed in fall or winter. The soil is clay or adobe.—Subscriber, Willows.

We would depend upon English rye grass and add a little eastern red clover to see if it would hold on. Both will stand overflow. The question is will the red clover stand the following drouth. The rye grass will bunch up and hang on.

Exclusion from Irrigation District.

To the Editor: In the formation of new irrigation districts is there any provision in the law to have the boundary so drawn as not to include an orchard which has been graded and in which has a cement pipe line and pumping plant, and which is located on the extreme edge of the boundary? To regrade the orchard to suit the new irrigation would be the practical destruction of the trees and the work of five years gone for nought—subscriber, Stockton.

We understand that land at the edge of a proposed district and not necessary to the operation of it has sometimes been set out and the owner allowed to install his own system from a local source. In the case we have in mind the land excluded was incapable of taking water from the district system. There is no provision in the law for such exclusions except as in the organization the parties entrusted may draw the lines as they judge best for the general purposes in view. Of course, in your case you need not take the district water even though your land has to contribute to the cost of installation, and therefore you need not upset your land and trees. You ought to retain a lawyer to ascertain what you can do. It is not an easy matter.

Almond Growing.

To the Editor: My orchard is made up mostly of I. X. L.'s with some Nonpareil. How should they be planted so as to pollinize properly. Do bees help pollination to any great extent? How does irrigation this year help the setting of next year's crop and at about what time should the water be applied?—W. F., McFarland.

According to careful experimentation, which has been carried on for several years at the University Farm, the I. X. L. and Nonpareil varieties are not effective as pollinizers of each other and therefore no arrangement of them can serve the purpose. In these experiments the Ne Plus Ultra is apparently the best pollinizer for I. X. L., and it serves well also for the Nonpareil. For convenience in harvesting each variety by itself the pollinizer should be planted in rows—one row to four or six of the others would be ample. Bees are the most active agencies known for pollination. Where irrigation is needed at all, the water helps the crop of the following year by continuing the growth during the current season until good fruit buds are formed for the following year. Such irrigation is usually best applied during July or early in August.

Sunburn?

To the Editor: What is wrong with trees that have this kind of decay down on trunk near the ground? The foliage is a lighter color this year on the trees affected this way.—Grower, Santa Rosa.

So far as we can judge from the few flakes sent us, the bark has been killed by sunburn. If the injury covers enough area around the trunk it would account for the failing foliage. Of course, we are not very confident of the accuracy of this verdict; it is too much like holding an autopsy on the thumb-nail of the corpus delicti. Give the trees a good irrigation, if possible; whitewash all exposed bark; reduce the top by removing branches which can be spared—cutting out those which seem most affected by lack of sap—and put on a good covering of manure this fall.

Covering Tree Wounds.

To the Editor: Is it advisable to paint over the stubs where broken or dead limbs are pruned off? I mean fairly large stubs of cherry or apple trees.—T. W., Sebastopol.

It surely is very desirable. Saw off stubs closely—up to the collar or slight enlargement, which usually marks the connection of a lateral branch with a main branch or of a branch with a trunk. The protective covering now chiefly used is "asphaltum, Grade D," melted alone or with one part of resin or one of paraffine to four of asphaltum. The addition makes the asphaltum less likely to run in hot weather. Lead and oil paint, rather thicker than for house painting, will do if it is handier to get.

Let the Alfalfa Do It!

To the Editor: I am going to put in a piece of alfalfa without irrigation, but one side of the ground is a little low. Would you sow melilotus or some other grass on the low ground, or risk alfalfa.—S. H., Colusa.

We should give the alfalfa a chance at the whole contract.

WILL YOU BE THE ONE?

We are going to add another man to our circulation force. He need not have experience or capital, but must be a red-blooded, dead-in-earnest fellow, who enjoys interviewing people and is not afraid of hard work.

If you have an automobile, are free to travel, believe in the Rural Press and would like to present it to others, perhaps you can qualify for the position. It pays a straight salary and is permanent.

If you think you are the man we are looking for, tell us why. Convince us that you should have the position and we will make you an attractive offer.

Is the Nitrate Holding On?

To the Editor: Last year we put nitrate of soda on some orchard ground, but had to put it on late as our place is all hill land and can only be plowed after the real heavy rains are over because of washing. After putting it on and plowing, this year, we didn't have a good rain to wet the stuff up. Do you think it will benefit the trees when the rains come this fall, or will the strength have left the nitrate of soda by then?—W. T., Forestville.

It is hard for us to believe that old Sonoma is ever too dry for a whole year to touch off nitrate of soda. It does not need much of a rain to do it: a shower which simply makes the soil moist is enough. In fact, if you leave nitrate of soda standing around in a heavy fog it will reach out for moisture enough to deliquesce—which means to run away by itself. For this reason we believe your nitrate did its job long ago and only a chemist could find trace of it now, and probably he could not if there had been what you mean by a good rain. If you can find now the substance which you put on a year ago it was probably not nitrate of soda, or if it was really dry as Arizona and you could still find it visible to the eye, you must have put on enough to kill any useful plant. But perhaps you only wish us to say whether nitrate will lose strength if kept dry. It will lose no strength, but it is practically impossible to keep it dry.

Gypsum as a Fertilizer.

To the Editor: Please send me information as to the use of gypsum on prune trees, method of application and price per ton.—W. P. G., Nicolaus.

Gypsum is a fertilizer in soils which need lime, but you can probably get lime more cheaply in other forms. Gypsum acts as a soil-mellowing, but other forms of lime are more active and efficient. Gypsum acts upon other soil ingredients, and perhaps renders them more available to the plant and thus stimulates their growth, but of course it does not enrich the soil in that way, but enables the plant to use it up more quickly. Because gypsum contains a form of sulphur it conveys to the soil this substance, which has recently been found to be more useful, directly or indirectly, than was formerly thought possible—which will be expounded soon by Dr. Lipman in his series on "Fertilizers and Fertilization," which is appearing in these columns. Gypsum may be scattered and plowed in during the rainy season. Fertilizer dealers advertising in the Rural Press will answer inquiries which you address to them as to the price at which they can supply the finely ground raw gypsum—which is the form needed for use on the soil.

Spring Silage.

To the Editor: What is the best crop to sow in fall for spring silage.—S. S. H., Willows.

You can silo winter-grown grains, oats, wheat, or barley, cutting into the silo when in the soft dough—about in the shape you would cut for hay. If it gets a little dry use more water when filling in. You can silo your first cutting of alfalfa with all the foxtail and other weeds thereunto belonging. You can also silo any winter-growing vetch or clover if you cut and pack down well.

California Weather Record.

The following rainfall and temperature record is furnished the Pacific Rural Press by the United States Department of Agriculture Weather Bureau at San Francisco for the week ending at 5 p. m. July 29, 1919.

Stations—	Past Week	Rainfall		Temperature

Milk--The Miracle Worker.

Written for Pacific Rural Press
By R. H. Whitten.

FATHER, what's a 'substitute'?" asked a schoolboy of his father. "A substitute, my boy," replied the wise father, is anything that costs more than the original article."

Had he been referring directly to substitutes for dairy products he could not have coined a more fitting or truthful expression. Take oleomargarine, for instance. Irrespective of its comparative cheapness per pound, the use of this camouflage is more costly in the end than that of the highest-priced butter, because those who eat it are deprived of a vital substance absolutely essential to the proper growth and maintenance of the human body.

Years ago we were informed that our food should consist of certain proportions of protein, carbohydrates and fat. Later we were told that the energy-creating capacity of foods was the main thing, and that they should be rated according to the number of calories. But now comes Dr. E. V. McCollum of Johns Hopkins University, who, after years of experimenting, is able to prove that foods have a physiological effect on growth and life-making capacity entirely remote from their content of protein, carbohydrates, calories, and all those jaw-breakers.

Dr. McCollum spent over 10 years investigating the diets of animals whose digestive apparatus is practically the same as that of human beings. He fed them a perfectly balanced ration of proteins, etc., and for fat he used the different ingredients used in the manufacture of butter substitutes, such as cocoanut oil, cottonseed oil, peanut oil and tallow. For the first three months these little animals seemed to get along all right, but then they lost appetite. They fell off in growth and seemed on the road to starvation.

Then Dr. McCollum fed the animals butterfat in place of the former fats, and immediately they began to grow and thrive. Then he took two little animals and put them on the same diet except that he fed the first one butter for its fat ration, and the other oleomargarine. At the end of the experiment the butter-fed animal weighed 262 grams and was bright-eyed and vigorous. The oleo-fed animal weighed only 109 grams and was puny, sluggish in movement, and had sore and infected eyes.

No Real Substitute for Milk.

This was one of many proofs that butterfat contains elements necessary for growth that the other fats cannot supply. These are the protective elements, called vitamins. They are found in butterfat, but not in vegetable oils or pork fat. They are also found in the leafy portions of edible plants, such as lettuce, onions, cabbage, spinach and the like. The contention is not made that grains, root vegetables and vegetable fats are not nourishing, but in order to make growth possible these must be supplemented with protective elements, and for these vitamins we must turn to dairy products or leafy vegetables.

Some animals, like cows, are built to handle great quantities of leaves, but man is not. Some races have tried to get their supply of vitamins from leaves, seeds, fruits and roots, but how do they stand? The Japanese are the best, but what are they? A distinctly undersized, shirt-lived people. Their infant mortality is distressingly high, and they have failed to achieve anything like what they could have done had they been better acquainted with the dairy cow.

As Dr. McCollum says: "Go all over that portion of the world where such dietary habits prevail and you will find people who are subjects or vassals. They multiply in considerable numbers, but their life is short; they are inefficient, of low mentality, and a failure from the standpoint of living a normal human life. On the other hand, the people who have achieved; who have become large, strong and vigorous; who have reduced their infant mortality; who are the most progressive in industry, science, art, lit-

erature and every activity of the human intellect, are the people whose diet contains milk and milk products to a considerable extent."

Effective in Combatting Disease.

Dr. McCollum further shows that in milk we have the means of combatting many diseases that have heretofore baffled medical science. Consumption, which rages in congested centers of large cities, is largely due to the low resistance caused by a diet made up almost exclusively of meats and cereals and little or no milk or green vegetables. Pellagra, a disease that has made a big toll in the lives of the Asiatic races, is due to an almost exclusive rice diet. Diseases peculiar to children, such as rickets, increase rapidly in communities where there is a curtailing of the normal milk supply. Bow legs in growing children are due to lack of milk, not to walking too young.

in milk is found that mysterious spark of life which makes the cow-keeping nations the greatest in the world—which puts force and energy and pep into their people.

Milk—the Real Elixir of Life.

Milk is Nature's own food. It contains all the ingredients necessary for nourishment, in just the right proportion of a well-balanced ration. It builds up the body, keeps it in repair, maintains warmth, and furnishes energy. It gratifies the palate and satisfies both thirst and hunger. It is an essential food—necessary to the proper maintenance of life. Children deprived of it do not develop properly; adults become weak, torpid and prone to disease.

Furthermore, milk is one of the cheapest of all foods when its real nutritive value is considered. One quart of milk is equal in food value to 8 eggs, 2 pounds of chicken, 3

butter as the stomach quickly absorbs 98 per cent of it. And remember, it is the digested portion of what you eat that counts. Foods with excess waste in them are luxuries; but certainly butter is not. Your body gets all you pay for.

Use more butter in cooking, as well as on bread. You do more than create palatable dishes. The butter is absorbed into the foods, and that increases their nutritive value, so there is no waste. Remember: butter is concentrated energy; the body needs it, and it is a most economical food even at present prices.

Cheese—Highly Nutritious.

Compare cheese with the 15 principal foods and you will find it first in food value per pound—preceding meat, eggs, bread and potatoes. It is a highly concentrated food, and takes the place of bulky, diluted foods. It has been one of the world's staples since the beginning of civilization, and the sturdiest people come from nations where cheese is a basic food. Old-world nations know its economy. They know its value as one of the most palatable, nourishing and delicious foods.

In these days of sky-high prices cheese takes on a new meaning, for it costs less than meat and most other foods, and there is no easier way to cut the food bill than by using more cheese. Commence to use it in place of heavier, less digestible dishes. Give it its rightful place. For cheese is a real food.

Ice Cream—the Delicious Food.

Yes, it is even more than delicious; it is strengthening and flesh-building. It contains more real nourishment than many of the dishes ordinarily considered necessary. A quart of ice cream has the full food value of 1½ pounds of steak, 4 pounds of potatoes or 18 eggs. There are unmatchable food values in this combination of cream and sugar for both growing children and grown-ups. As with cheese, there is no waste. Your body gets every ounce of nourishment you pay for.

Ice cream should not be added to a full meal, but should be a part of the meal. A sensible plan is to have less bulky foods during the meal and a dish of ice cream at the end. It is just the thing, too, for in between meals. It is easily digested; keeps the stomach in good order, and is so safe that it is often the first food allowed convalescents.

Begin eating more ice cream now. Use it in place of other foods. You will live better and longer; will feel happier and stronger; will earn more and spend less.

Here's for More Milk-Fed Americans.

"Sparkling eyes, clear skins, good teeth, ruddy cheeks, snap, pep, the joy of life, belong to all who use dairy foods liberally," says one noted authority, so if you want health, physical and mental development, drink more milk and eat more butter, cheese and ice cream. And encourage others to do likewise. Lend your support to every worthy movement to this end. If you are in any way connected with the dairy industry get behind the California Dairy Council in the excellent work it is doing to educate the public to the real food value of dairy products. We must make milk the national drink and dairy products the most popular foods.

ANOTHER ADVANTAGE OF BREEDING UP.

We hear a great deal about the additional weight put on steers by a pure-bred cross, but there is another important advantage, and that is in the additional value of the heifers retained for breeders.

In the fall of 1915 a cattleman took calves away from two of his cows at the same time. One was a scrub mother; the other a grade Hereford. The two cows were fed alike, yet when they were marketed the scrub brought \$38.65 and the grade \$110. Here was a difference of \$81.35 due entirely to the pure-bred cross.

Children Need Milk

for
health
growth
strength

Poster used in a Wisconsin campaign to increase the consumption of dairy products. It was actively supported by the extension department of the State University. The movement in this State has the backing of our College of Agriculture and a big drive will soon be started.

A Powerful Stimulant.

Milk is one of the most powerful stimulants known. This was discovered at the Pasteur Institute at Paris, and afterwards milk was given to the French soldiers in the trenches. To many of them it was the only stimulant, and the effect more than justified all the claims made for it. The stimulating effect of milk was especially noticeable when given to soldiers just before a big battle, and also when in great fatigue. Its advantage over alcohol is that there are no bad after effects, and the keenness of the senses is in no way impaired or the coolness of the judgment affected. It seems to have some magic power of not only whipping up the living tissues, but also holding them pleasantly to the task without the subsequent reaction and collapse so usual with strychnine, quinine, ergot and other artificial stimulants. While it is a vital tonic, it is also an essential food, and thus it becomes the sort of tonic that leaves not the slightest trace of harm behind.

It is claimed that our own Devil Dogs could not have gone down into the hell of Chateau Thierry had they not been milk, butter and ice-cream fed—had they not been brought up largely on dairy products—and this proves the statement that the diet of a nation is responsible for the health and achievements of its people. For

pounds of fresh codfish, four-fifths pound of pork chops, or three-quarters pound of steak. Thus, even at 15 cents per quart, milk would be equal in food value to eggs costing at least 34 cents or steak costing about 25 cents—more, if the cost of cooking is included. Why, at double its present price milk would still be one of the cheapest of foods.

Cut down on some of the more expensive foods which are not so easily digested and not nearly so nutritious, and double your milk consumption. Use more milk in cooking. Load up your food with this rich nutriment. Don't begrudge pure cream on cereals and other dishes. And drink, drink, drink lots of milk. Children should have at least a quart a day until full grown, and adults at least a pint. Don't think of it as suitable for children alone. It is the ideal food for men or women who work with muscle or brain. It builds tissues and healthy minds, and furnishes the body the power needed to do its work.

Butter—the Energy Producer.

Too many persons think of butter as merely a spread for bread, and overlook the fact that it is one of our chief energy foods, 80 to 85 per cent being pure fuel-fat. Then there is mineral matter for bone building and some protein for muscle-making and repairing.

There is practically no waste to

Walnut Varieties Adapted to Northern Conditions

(Written for Pacific Rural Press by Jno. J. Fox.)

What are the best well-known walnut varieties to suit Northern California? This was a question we asked Professor Ralph E. Smith recently and received a prompt reply that he considered the Concord, Eureka and Payne's Seedling three of the best for the northern sections which are suitable for walnut culture. Not long afterwards we visited the Bowman-Kuhn orchard at Milpitas in company with C. J. Kuhn, whose experience here with Eureka and Payne's Seedlings is an endorsement of Professor Smith's opinion, as is the fact that

standing together which produced 250 pounds of nuts each last year. He says that the Payne's blight a little but allowing for blight and drop they still produce more than any other variety.

The Processing Department.

The equipment in Mr. Kuhn's packing house is modern and adapted to his labor requirements. The washing, bleaching and grading is automatic, but the grading pickers' table has been made longer to accommodate more girls. The nuts are then con-

possible to cut much grafting wood from a full-bearing tree, because of this. Yet even with very heavy crops good-sized nuts are always produced. Mr. Payne's method of keeping his young trees from sprawling is to erect a center post—a 2x4—and tie the branches up to that. He has 34 acres in walnuts and has done all the grafting on this place.

The well-advertised Santa Rosa walnut tree is on this place. It was a California black top-worked by Mr. Payne, when he was a lad and took three years to complete. It is known as perhaps the largest bearing walnut tree in the State—its banner crop being 741 pounds of nuts. It is a Santa Barbara type of nut, but is apt to blight.

Grafting Old Limbs.

We asked Mr. Payne what he thought of grafting limbs or branches on the under side. He said: "Well, of course, you can see from the running growth along this limb that the sap flow is strong below and weak above. That is why the upper shoot on each year's growth shows small. But a graft on the lower side of the limb intensifies its downward inclination—also its weight of foliage makes it easier to tear out if inserted there. For this reason I always put my grafts at the sides—they are stronger and better placed." He showed us one Payne's Seedling that had been grafted onto a Paradox, five years ago last spring. It was a large tree and produced 45 pounds of nuts the second year after grafting. The third year it yielded 243 pounds of nuts, and the two following year 340 and 341, respectively. The limbs still carried the sack protectors that were bound round them when they were grafted though they are of course no longer necessary.

Type of growth on a vigorous Eureka walnut tree. Note the dense foliage and stalwart character of growth on this young tree.

Concords are the leaders in Contra Costa county.

Varieties Tried.

Mr. Kuhn has 107 acres in walnuts though there are still some California blacks not yet worked. The oldest trees are only 15 years from the black nuts, which were planted and left to grow for three to eight years before they were top-worked. He would not pursue this method again—it takes too long but he has since bought some rooted "black" trees and planted them in orchard form—now nearly ready to work. They are planted 48 feet apart and the varieties are Franquette, Mayette, Payne's Seedling and Eureka. He likes the Eureka and Payne's Seedling because they are more profitable and is working over 100 large Franquette trees to Eureka. The growing season of the Franquette is too short for a vigorous condition—the foliage is light as is the usual set of nuts. Eureka trees are four times the size at the same age and laden with nuts which are all large—few second grade. They shell out of the husk easily and when bleached are of good color. The first drop of nuts is not so well filled, but when the main crop drops the meats are full and plump and the nuts will go 20 to the pound.

Difference in Weight.

Mr. Kuhn processes and packs his own fruit under the Golden Gate brand, and last year sold large quantities in holiday packages—weight five and ten pounds. The ten-pound boxes used for packing Eureka were only six inches deep; Payne's about seven inches, and other varieties seven and a half inches, other dimensions being the same.

With regard to the Payne's Seedling, it has to be encouraged in all the vigor of its growth during the first few years. For when it comes into bearing it is so prolific that its wood growth is checked and it sizes up slowly compared with a Eureka tree. Nevertheless, it turns off the fruit.

Mr. Kuhn's Payne's Seedlings were loaded. He pointed out three trees

veyed to their respective grade bins which are in gravity rack form, each having a sacking station. Each side of these slatted bins is exposed to free-air currents, which insures a thorough drying-out and safety from rodents.

New Niagara Dusting Machine.

A new Niagara power duster has been bought so as to deal with the aphids when occasion arises. Aphids is occasionally so bad on walnuts that the tree drip and the leaves become blackened, which is a great drain on the vitality of the tree, as well as lessening its growth.

This duster was bought through the Association, which buys wholesale for its members and sells at cost. The whole cost was in the neighborhood of \$300 including gas engine. The aphid dusting-powder was supplied at five cents a pound plus freight. Mr. Kuhn has 30 acres of his walnuts inter-set with young pears, which have just been cleared of pear slug and mites by the use of this mixture—at least, we could discover no live ones.

Because of his experience with the different varieties, his brother, A. C. Kuhn of Evergreen has this spring worked all his black walnuts to Eureka and Payne's Seedlings. These will be pinched and manipulated during the growing season so far as possible so as to obviate the winter cutting and conserve the early creative efforts of the trees. This can be done in July and August in this section with reasonable expectation of maturing new growth before the frost.

Pruning.

George Payne of the Moorland district near Campbell, whose father originated the Payne's Seedling, said that a system of pruning could probably be evolved to good purpose for forcing more wood growth on this variety.

The tremendously heavy bearing nature of the Payne keeps down wood growth to a degree, thus tending to keep the tree small. It is next to im-

possible to cut much grafting wood from a full-bearing tree, because of this. Yet even with very heavy crops good-sized nuts are always produced.

A YOUNG PRUNER'S ACHIEVEMENTS.

To the Editor: I saw in your paper sometime ago where a man of our county has got as much as ten tons of peaches to the acre, and so I thought I would tell you how much we have been getting. I have done the pruning for my father for nine years and pruned from fifty to sixty trees a day and never used a prop or broke a limb.

Last year was a light crop for most of the orchard and still they went a little better than ten tons to the acre. They have not gone less than ten tons to the acre for five years, ever since they got into full bearing. His trees are Phillips and the men at the cannery say they are the best brought in, and it is seldom that small fruit is to be found. The trees are now in the best shape they have ever been in and look as if they would go fifteen tons this year.

I bought a place for myself four years ago and it was all run down and the trees had not had much care when I got it, and so I had to build them up before I could get a crop. My trees are nearly all Muirs and Lovells. In 1917 two or three of my Lovell trees bore at the rate of 22 tons to the acre, and last year they had a crop that would have gone fifteen tons to the acre, without one broken limb and without props. I think that is getting some crop out of old neglected trees. —Fred W. Caulkins, M. R. A., Box 363, Ceres.

Big Ben Necessary.

What gets us guessing is how this daylight savings plan works out in the land of the Eskimos, but we suppose all they have to do is to get up six months earlier each morning.

Still not too late to have your INDIANA SILO ready for this harvest-time

As soon as your order is received we ship complete directions for buildings. The complete Silo is shipped by the time your foundation is built.

You need no skilled carpenters to erect the Indiana Silo. The usual size is easily put up in two days with a couple of unskilled helpers, a saw and a hammer, and a wrench.

—and when it's up you know it's going to STAY UP.

The straight grained fir staves, held firmly together with shaped steel hoops form a wall that will not burst. The silage juices actually preserve the fine fir fiber.

Send in right away for the full statement of the EASY TERMS and a blank contract. SEND FOR FREE SILO BOOK, TOO

Address Dept. B

The Chas. K. Spaulding Logging Co.

NO WASTED SILAGE

The Air-tight walls and doors of the Indiana Silo keep the silage sweet. None thrown away. It's all good in the Indiana.

Preparations for the Approaching Prune Harvest

(Written for Pacific Rural Press by Jno. J. Fox.)

Every grower we have visited lately is either scrubbing or repairing his trays, or is just going to. Dippers and mechanical graders are being cleaned up or new ones installed. But, in spite of the enormous crops and the phenomenal prices in sight, singularly little activity is shown in the purchase of new trays. There is a lot of repairing of trays going on, and on asking different men how they figure on making out, find the following schemes have been evolved.

Taking No Chances.

Two men in one county are installing evaporators, though strangely enough one of these is also making up a lot of new trays "in case the dryer falls down on the job." He had bought his trays early and is taking no chances.

Another man said: "When my fruit is nearly ready to put in the house I shall put it in sacks—about a bushel or a little more to a sack—and let it sweat a little stacked out of doors. I have done it before and find it cures the fruit to a glossy finish in excellent

frame so that when the eight-foot tray is tipped into it, no prunes can spill out the other side. The whole thing can be made in a few hours at a cost of a couple of dollars. When boxes and trays are both scarce, two men can sack prunes as fast as they can tip the trays. The sacker is so light that it is easily moved from one stack of trays to another.

In Case of Rain.

It is well, in case of rain, to have a sheet to throw over that platform. It doesn't take long to shovel them into a heap in the center and throw a few trays over, but the canvas sheet makes them safe. Trays with a strip of building paper were used last year in some instances with success in covering stacked trays. A roll might come in handy and need not be cut unless it were needed. Thirty trays to a dry ton is running things pretty close in the north here. It doesn't pay to take too many chances. For quality means weight and every pound of weight this year is the price of a good cigar.

California cured fruits are dried in yards adjacent to the orchards that produce them.

condition. You have to use care, but I turn the sacks after a few days, and I think I gain in weight as well as quality with this method." Several other men were making up a number of new lug boxes and repairing their old ones. The new boxes will be used in the orchard and their weaker brethren will be used later for stacking prunes that are not quite dry enough to bin. They will be stacked outside till they are ready to warehouse. In this way many trays can be released perhaps two or three days earlier than they otherwise would.

The Platform Method.

Still another way of releasing trays when drying weather is poor is to build a platform and when the fruit is a little past the doubling stage or about there, dump it onto the platform to a depth of six or eight inches even, all over. They may possibly need shoveling over once before they are ready to box, but that platform is a great help in time of need—when the number of empty trays is shrinking and fruit is pouring in out of the orchard. Find a good level place and lay your two by threes on the flat side about three feet apart and then tack on rough 1x12 pine sheathing with sixpenny nails, so that the boards are easy to rip off again in a few weeks' time. Tack a board all around the edge to keep the fruit from spilling on the ground when the trays are dumped on it.

A Sacking Contrivance.

A useful apparatus was contrived last year by Guy Winfrey—a Napa man—for sacking prunes from the trays. It consists of a shallow trough, supported by a buck at each end and one in the middle. The trough is just high enough for a sack to stand beneath it. There are three openings in the trough with a sacking hook to each one and the back of the trough has shakes nailed to a

A good straw-boss in the field who knows how to keep the piece-workers from shaking the trees would be useful, though probably tactful men are rather rare just now. Anyway there is going to be in some districts a predominance of high-class help, and that lends strength to the whole productive industry.

Prune Dippers and Graders.

This year will probably see more prune dippers and graders installed than any single year which has preceded it. For there is such a good crop of prunes this year, and the prices warranted by the extraordinary demand will make every grower want to turn off topnotch quality of fruit in the shortest time possible.

Now, if the thirties and forties are all dumped on the trays with the nineties and hundreds (up), the whole mess has to stay exposed to the sun until the heavy prunes are properly cured. By that time all the smaller fruit has dried up as hard as gravel. Not only is the quality impaired, but the loss of weight is enormous on a tonnage. And those little dried-up prunes will never process out into as attractive a form as they would have if properly cured. That is one reason, and the biggest, why prunes should be graded before being set out on the drying ground. They are separated into two very distinct grades, the smaller of which can be boxed sometimes four or five days before the large ones are ready—according to the weather and how they are handled. This means a large saving in weight and in size. The little prunes, if not over-dried like a chip, will give you the advantage of several points on the grade-sheet if properly cured—in addition to the extra weight. Labor is lightened also by the elimination of all skinny windfalls and hog-prunes.

The dipping of prunes in lye, which

can be kept at boiling point all the time by means of coils, is quite a different thing from dipping them in a kettle, where the very first basket of cold prunes lowers the temperature below boiling point.

As the water gets colder by steady dipping, we leave them in—or are tempted to—a little longer and find they don't dry as well and the skin is toughened. Time is saved in dipping and dumping by using the patent dipper and a much better curing result is obtained where the proper temperature can be maintained. Then a proper cut of the bloom is obtained by a few seconds' immersion in the boiling lye. (Imperials get by with next to no lye as they are tender skinned.) The skin looks finely wrinkled, but will not come off with the sweep of the paddle.

The second factor, next to the correct "dip," is to have plenty of trays

so that you don't crowd the fruit and have a lot of prunes riding on the others. It delays the curing and adds greatly to the expense of handling—especially of a season when a lot of those muddy-colored ones show up at the early dip and maybe have to be hand-picked. These can be dipped again and dried by themselves, but they never make good prunes. It is better to have too many trays than too few, especially of a poor drying season.

ARCADIAN Sulphate of Ammonia

A ton of ARCADIAN Sulphate of Ammonia carries more plant food than a ton of any other nitrogenous fertilizer.

ARCADIAN Sulphate of Ammonia is the well-known standard article that has done you good service in your mixed fertilizers for years past. Especially kiln-dried and ground to make it fine and dry. Ammonia 25 1/4%. Made in U. S. A. Arcadian is the great American Ammoniate.

Kills the Weeds and Cultivates the Soil
Greatest weed killer on the market. Cuts them off clean, under the surface, close down to the roots. Besides, it breaks up the ground so thoroughly that one user says he saved \$200 in a single season because after cutting the weeds he did not have to plow. Cuts seven feet or less. Weighs but 230 pounds. Cut adjustable to any depth. Constructed of steel throughout. No other implement like it.

2838 Locust St., St. Louis, U. S. A.

This Makes Your Soil Pay

Makes it yield the limit because it so crushes every clod and loosens up every particle of plant food that the seed sprouts quicker and plant grows faster. This Brilliant King Pulverizer (Team or Tractor) also packs the undersoil for retaining the proper moisture for the quick-

est future growth and greatest crop yield. Fine for early cultivation of all crops and packing wheat against winter killing. Pack your wheat with it this fall. Lasts lifetime. Price reasonable. Strongly built. Get one.

AT ALL JOHN DEERE DEALERS

HORTICULTURAL JOTTINGS

Large shipments of peaches are being made from Tulare County.

Up to June 30 the Federal Land Bank of Berkeley had closed 4,192 loans amounting to \$12,541,200.

First shipments of pears from Lodi are reported to have brought as high as \$7 a box in the eastern markets.

A number of new members are signing up with the Prune and Apricot Growers' Association every week.

An extraordinary quantity of apricots has gone to the canneries this year.

The non-bearing acreage of lemons in California is only one-fourth less than the bearing acreage.

The Georgia peach crop was estimated to amount to 7,700 cars for the season (Bureau of Crop Estimate).

The California Co-operative Canners at San Jose have 500 workers on the job, and about 100 tons of fruit are coming in daily.

Some injury to prunes from sunburn is reported from all sections. Butte County's drop from this cause is considerable.

G. L. Barham of Chico, who has 40 acres east of town, claims that June drop can be largely reduced by irrigation.

The Durham State Land Colony lost considerable water by the rupture of a diverting dam, which, however, has now been repaired.

All our Farmers' Selling organizations have established brands that have won the entire confidence of the world's markets.

If the year's grape crop is harvested a good many evaporators will be installed with some of the money in the hope of finding some permanent markets for dried grapes.

The California Co-operative Canners are busy in their plant at Tulare canning peaches. They bought the Tulare County peach pool peaches at \$92.50 a ton.

Forty per cent of the state's peach crop is produced in Fresno, Kings and Tulare Counties. Fresh peach shipments east will probably reach 4,000 carloads.

Experiments in cross pollination of cherries will be conducted in Santa Cruz County next year by the Farm Bureau through the University of California.

The Prune and Apricot Growers' Association will this year spend in the neighborhood of \$200,000 for advertising and extending markets for the California prune.

The Prune Growers and Nurserymen's Committee on bud selection meets in the Santa Clara orchard around the first week in August, according to Leonard Coates of Morganhill, who is chairman of the committee.

Prune growers in Santa Clara County have agreed to pay \$6 to \$9 per ton for picking prunes, according to the crop and other conditions. Others are paying their help by the hour.

The prune crop in Lake County is a good one. In a few thin-land orchards where moisture is none too good there are signs of sunburn and shedding of fruit, according to Horticultural Commissioner F. G. Stokes. The Fruit Growers' Supply Company has just placed an order for 25,000 kegs of nails for nailing up the orange and lemon boxes of members of the Fruit Growers' Exchange. These nails will cost \$112,500.

The Navel orange set in the Porterville section promises 65 per cent of a crop. The June drops showed up the worst in groves where orchard management was faulty or deficient. The younger groves look promising.

Eight thousand cars (of 350 crates each) of cantaloupes were shipped out of Imperial Valley this season, 3,000 cars more than any year previous. This made 33,600,000 melons for the season!

Apricot canning is now over in Tulare County, and peach packing has commenced. Sixty-four per cent of the apricots graded fancy. Opening prices on these are quoted at 53.75 a dozen. Both production and quantity was higher than anticipated.

We Manufacture Levelers for Any Power From 6 Horses to a 75 H. P. Tractor

A Schmeiser Leveler

WILL WORK WONDERS ON YOUR FARM

Moving immense amounts of dirt daily, and working on ground too tough for horses and Fresno to tackle, SCHMEISER POWER LAND LEVELERS are now being used with utmost success by a great many ranchers, large and small—also by contractors—saving their owners' time, labor and money.

So extremely simple, a child could operate one, as a simple twist of the wrist raises and lowers the bucket or holds it stationary, as the case may require.

A GREAT ROAD MACHINE

Every road district should own one of these machines for constructing roads. They will cut down the high places and make fills quicker and cheaper than by any other known method.

Here and There in the Fruit Business

[Written for Pacific Rural Press.]

Fungus Diseases Reduce Peach Crop.

California probably has a record peach crop. The eastern peach crop was reduced probably 50 per cent by curled leaf and brown rot in New York state and by curled leaf in Michigan and Ohio. The latter state shows also a decrease in acreage. Brown rot has caused loss in Arkansas, Oklahoma and Texas. The Georgia crop will approximate 7,400 cars. The July report of the Bureau of Crop Estimate gives a total crop estimate on peaches of 30,082,000 bushels for the entire country as compared with 20,797,000 bushels last year.

Apple Crop Under That of 1918.

The Bureau reports a July estimate for the whole country of 24,454,000 barrels as compared with 24,574,000 barrels in 1918. Of this, the states of New York promises less than one-third of last year's production. Washington will probably lead the states in commercial production by a large margin. Her admirable system of standardization has given her a market lead. We ought to have been provided with the means to duplicate it. When we have more growers and fewer lawyers to represent us at the legislature, the importance of measures affecting the fruit industry will receive fuller recognition.

Prune Growers Getting a Hump On.

As an instance of the thoroughness prune growers are exercising this year, the large manufacturing concerns are working overtime to get out new equipment. The Smith Manufacturing Co. of San Jose have increased their manufacture and sales of dippers and graders 500 per cent over last year. By the second week in August all orders will have been filled for green graders and dried fruit outfits by September 15. Last year was a big year for cannery equipment, but this year's business beats it by 80 per cent. One and a half to two shifts have been working in the factories the past four months to produce equipment.

Dried Apricots Being Marketed.

Two cars of mixed sizes of this season's dried apricots were shipped east from the Hanford plant of the California Prune and Apricot Growers' Association the third week in July—one being sent to Chicago and the other to New York. This is the first of the new crop of California dried fruit to be sent out this year. They will bring members the highest price ever paid for dried fruit this year. Regular shipments will be in full swing early in August. Dried apricots from Southern California will follow the first shipments from the Hanford district, and later the Santa Clara Valley fruit will be used to fill orders. This is the order of ripening of the fruit.

Labor in the Orchards.

A great many towns and rural centers are providing automobile ground and suitable camping sites for work-

ers, and a number of automobile owners are taking a pleasant and profitable vacation by assisting in the fruit harvest. The merchants and business men and the Chambers of Commerce are all interested in the development of convenience and sanitation of these camps. Hollister has busied herself in this direction. At Lodi, though labor is none to plentiful, the women's organizations are going a long way towards solving the problem. They are expert, energetic and business like and have learned to work with system and rhythm.

The Canning Industry and Labor.

The California Packing Corporation operates 39 plants, extending from Santa Ana, Calif., to Salem, Ore. Our many large California packing and canning corporations are handling a tonnage of fruit and vegetables this year that is stupendous in the aggregate. A wonderful and rapidly growing industry that is spreading our fresh fruit over the face of the whole inhabited portion of the world.

Conveniences for Cannery Employees.

The installation of adjustable stools for cannery workers is much appreciated by the workers. The many conveniences and thoughtful provision made for workers in modern canneries are not only a means of conserving energy, but make the work a pleasure. This has resulted in bringing in a large influx of high class labor formerly unavailable. We have noticed the well fenced play grounds and conveniences for small children whose mothers are employed at the benches and tables. The prices paid for labor this year shows that all are participating in the benefits of California's banner fruit crops.

Canning Grape Juice.

White grape juice may be successfully canned, but red grape juice loses its color in cans, as shown by experiments conducted by the Viticultural Division of the University. The process is very simple. Crush and press the grapes. Heat the juice to 150 deg. F. Allow to cool. Strain or filter. Heat to 130 deg. F. Can, seal, sterilize 30 minutes in water kept at 175 degrees F. This juice has a remarkably fresh flavor and has been held successfully for over three years. It is a good beverage and could also be exported for white wine making. Wineries could undertake its production with little additional cost to present equipment.

So. American Markets for Dried Fruits

"Before the war our national trade made but little impression on South American markets because we failed to meet their conditions on matters of credit," says H. G. Coykendall, General Manager of the Prune and Apricot Growers' Association. "With the advent of trade acceptances this difficulty is to a large degree overcome, and we anticipate that our efforts will be highly successful in establishing good markets there."

THE PEAR SEASON IS NOW ON—CAUTION NECESSARY.

(Written for Pacific Rural Press.)

The unusually early ripening of pears this year has resulted in some congestion. Boxes have been rushed to the growers from canners as fast as the request could be fulfilled.

There have been a few complaints that some early shipments were far from meeting contract grade. In one or two instances of windfall pears for drying, everything seems to have been dumped into the boxes, which necessitated a resorting of the consignments. Again, a few shipments have been received of No. 1 pears containing four to five per cent of worms, whereas the contract provides that No. 1 pears shall be free from worms.

A No. 1 pear is two and a quarter inches and over, free from scab, worm or thrip scar, is suitable for canning, and is picked from the tree without bruises.

A No. 2 pear is either a perfect pear 2 to 2 1/4 inches in diameter, or a pear 2 1/2 inches up, which will cut one perfect half.

The grower should watch his sorters and see that the terms of the contract are complied with. It saves trouble and expense in resorting, reductions, and explanation, and means a Square Deal. And it pays.

Under the best average of the old prices—\$40 for No. 1, \$20 for No. 2, and \$10 for windfalls, we had to sort pretty close. Under present prices of \$85 a ton for No. 1, \$50 a ton for No. 2, and \$35 for windfalls, growers can afford to sort closer than ever. For instance, we will say that out of ten tons of pears you have seven tons of No. 1, two tons of No. 2, and a ton of windfalls, you are getting an average of \$45 a ton on the No. 2 and windfalls combined and \$73 a ton on the orchard run.

The **DEALER** says—
"the **GIANT** mark
protects you from
imitations"

"It pays me to give my customers what they ask for," says the retailer who knows what's what. "When they ask for 'Giant Powders' I give them GIANT Powders—the real Giant, made by The Giant Powder Co., Con. I don't tell them that 'I have the same thing, only under another brand name,' because it is not true.

"The name 'Giant' on a case or a stick of powder is evidence that the powder is made by the company that originated Giant Powders. Remember this: You can't get Giant results when you use ordinary dynamite that look like Giant but aren't marked Giant."

Look into the new, money-saving methods of clearing land, blasting tree beds, ditches, boulders, etc. They are all described in our up-to-the-minute book, "Better Farming with Giant Farm Powders." A post card will bring it by the first mail.

A REPLANTED ORCHARD.

(Written for Pacific Rural Press.)

We have often heard it said that it was useless to replant where an old orchard had been grubbed as the trees would never make good growth. Last year we noticed forty acres of prunes one year old that had been planted between the rows of where an old peach orchard had been grubbed. They showed good growth, for though the soil was thin and "cobbly" they had had excellent care. We are still of opinion that they will make the main of their size in bearing area within six or eight years. Last week we saw an orchard of seven-year-old apricots on the Van Orden and Emerson ranch at Mountain View, which had been planted in the identical holes where an old cherry orchard was grubbed—and without a rest. They were certainly creditable sized, healthy trees for their age, and large enough to bear a good commercial crop of fruit. The owner very pertinently remarked that as there were no feeding roots for some feet around the trunk of the old cherry trees, the young 'cots had fresh soil to start in. That is a new angle again and one that is both reasonable and novel.

FREIGHT RATE INCREASE.

Interstate Commerce Commissioner Clark told the committee of fruit growers and others who are protesting against freight raises in the fruit trade: "Commercial competition, not the cost of service, underlies rate making. Power to prescribe minimum rates and to control water as well as rail carriers would assist the Commission, whose rate policy had been based partially on the theory that healthy competition between rail and water carriers was to the best interests of the country." Some rule of law governing the present application of the long and short haul clause act is necessary, the committee was told. "The Commission's task at present requires it to deal with conflicting interests of communities and territories when those interests are completely irreconcilable. The present act lays down no rule of law which can be followed." Twelve thousand growers and shippers, members of the California Citrus League, are protesting.

A CAPRI-FIG RECORD.

To the Editor: Some one noticing an account of a fertile Capri tree, suggested that I send a brief history of one on my place. It was set out 9 years ago and it is thought came from some grower near Corning. When it became old enough to bear, a colony of wasps drifted at least 4 miles across the country and took up their abode in the tree. The late frosts of 1918 killed off the most of the figs, though I sold about 1,800 figs in 1916. I had none to spare, however, in 1918. This year, 1919, the tree came along with a crop that to my inexperience seems fairly good for I have sold nearly 8,000 figs from it for Caprification. I noticed the first wasps coming out June 15. The wasps fertilized my own Calimynas of their own accord in addition to the large sales made. The tree is very large, stocky and thrifty. It carries plenty of the mammoni and mamme crops as well as this large profichi crop. It is interesting to know what a Capri fig can do when it sets out. H. S. Edwards, Princeton.

Irrigation and drainage must be apurtenant to the soil in every district. The large areas and uneven land contours make co-operation necessary for effectiveness. The men who own the land must acquire control of the distribution of their own water supply and the disposal of surface drainage by united action so that no one man, large or small, shall block either system, exploit or otherwise render it ineffective.

No man today, least of all the farmer, can wrap himself up in his own business. He must extend his sympathies, his aid and good fellowship to others for the general good.

HAULING fruits and vegetables to the market is a branch of work in which Nash reardrive trucks excel. With pneumatic tire equipment furnished at additional cost, Nash trucks will travel up to twenty miles an hour. This speed enables the market gardener to make his round trip in a day with time left over for work at home.

Morris & Company, The Standard Oil Company, The Palm Olive Company and the American Steel Foundries Company are among the nationally known concerns now using Nash trucks.

SURFACE IRRIGATION PIPE

Farm Owners' and Operators' Assn.

(Written for Pacific Rural Press.)

At a meeting of the board of directors of the Farm Owners' and Operators' National Association in Stockton July 24 several representative grain growers were present and the wheat situation was discussed quite freely. Farmers have too generally held the idea that \$2.20 per bushel for wheat meant that much net for the farmers and some have thought that all wheat would bring the same price.

In marketing their crops, they have encountered deductions of various kinds, including freight to San Francisco, weighing charges, dockage, grading, etc. The meeting was largely one of inquiry as to whether these charges and various practices of grain buyers are authorized or are partly impositions permitted or not permitted by the U. S. Grain Corporation. For instance, grain hauled from the country around Stockton to the mills in that city is paid for on the basis of Government price less the freight to San Francisco. The grain growers and directors wanted to know who benefits from the freight charge that is deducted from the producers' price but is not paid to the railroad. Considerable variation in the weighing charge for wheat was disclosed. It was also pointed out that a good salary could be paid from the sweepings of warehouses where several buyers might sample each lot of wheat or other grain and considerable leakage would come from the many holes made by their triers. There was a feeling that wheat at least should be weighed before buyers' samples are taken—a small item but a source of considerable irritation. A suggestion is made that it might be a good thing to have official samples taken of each lot for farmers' grain, to be kept at central points for buyers to see.

The dockage question still seems to be a source of complaint. One man's grain graded by the Association grader J. E. Riddell showed about six per cent dockage, five per cent of which was plump barley, which is worth nearly as much now as wheat, after being separated.

It seems that an impression is current that the Government intends to fix the price of wheat next year also and possibly to fix prices on other grains. This was discussed at the meeting as a subject for a fuller hearing from the farmers than heretofore. A motion was made to call a mass meeting of farmers of the State to discuss the subject. September 1 was suggested for such a meeting, but the matter was left with the executive committee with power to act. Such a meeting would not be fully desirable unless every district in the State were represented. A date is desired when the harvest will be least pressing in fruit and field crop districts throughout the State. Present at the meeting were J. M. Bigger, J. A. Shearer, Fred Rindge, Wm. Thomas, John Tone, David Young, C. D. Benjamin, Albert Lindley, C. A. Stowe, D. O. Castle, McD. Ross, and Herbert Smythe.

Dockage Exhibit.

Several of these are lifelong grain growers, yet they had never seen the process of grading their grain. They were greatly interested in Mr. Riddell's apparatus and operations. They were more interested to see the proportion of valuable dockage being taken from samples of their own grain. The apparatus, including a "kicker" for separation purposes, a glass-enclosed scale, other scales and equipment cost not over \$400 total, yet the knowledge of the exact condition of their grain may save any one of many members that much on one year's crop.

A number of the samples along with the various kinds of dockage contained in them were set aside to be exhibited at a meeting of the local unit of the Farm Owners' and Operators' Association at Waterloo last Saturday night.

Moisture Tests on Corn.

Since moisture content is of so much importance in California-grown

Indian corn, it is proposed that equipment be obtained for such tests to be made by the Association grader. It would be inexpensive, and Mr. Riddell became acquainted with the way to do it while he was taking lessons on grain grading at the U. S. Grain Corporation offices.

LIVERMORE HAY AND GRAIN.

(Written for Pacific Rural Press.)

Livermore Valley and the hills surrounding it in Alameda county are more prosperous this year than during the past two seasons, according to E. G. Wente of Livermore. The hay crop has been good, though grain prices and prospects have reduced the acreage cut for hay. There are between 12,000 and 15,000 tons of grain hay in the Valley as against 18,000 tons normally made. All of last

season's crop and about ¾ of the present crop has been sold, prices being about \$16 per ton to the growers for choice wheat hay and corresponding prices for other kinds and grades. City hay consumers have been laying in their stocks for the whole season.

The barley situation is highly satisfactory for those who held until the present, but about ¾ of the 200,000 sacks which are still being threshed have been bought up by San Francisco people, who paid around \$2.65 and \$3. They are now paying \$3.05 and \$3.10 for shipping barley. This grade constitutes about one-third of the crop, a better percentage than usual.

Wheat is being hauled to the warehouses, largely to be held for sale to the Government unless California mills demand it first. It is hard to estimate the crop as a whole, because so many growers who thought they had twelve or fifteen sacks per acre have threshed less. Mr. Wente estimates the average wheat yield at eight to ten sacks per acre in the Livermore Valley. Total acreage of grain planted was greater than in any recent year.

BEANS CLEANED UP.

Bean acreage in Stanislaus county is curtailed this year to about the extent that unsuitable areas were planted last year, but most of the good bean land is being planted again, as reported by Thompson Bros., dealers of Modesto. Beans following grain have a poorer chance this year because irrigation was shut off about three weeks early.

Last year's beans, especially blackeyes, are pretty well out of growers' hands now. The carry-over is likely to be not over 15 or 20 per cent of the crop, teparies only being hard to move. Practically all dealers are trying to contract for the coming crop, farmers having been offered about 5½ cents for blackeyes and seven to eight cents for large whites. Spot blackeyes will sell easily now at four cents. Farmers are generally holding for higher prices. This county is going stronger to Henderson Bush and Red Kidney beans, both of which have previously proved successful in smaller acreages on heavy and sub-irrigated soils.

MOLINE

System of Power Farming

Makes You More Money With Less Hard Work

Thousands of Moline Power Farmers in all parts of the country are making more money with less hard work. They are getting more profit and enjoyment from farming, and you can do the same by using the Moline System of Power Farming.

With the Moline-Universal Tractor and Moline Tractor Implements, you can do all farm work, including cultivating, faster, better and cheaper than you ever did before. You can eliminate practically all your horses for field work. And one man operates both tractor and implement from the seat of the implement.

Read what the Moline-Universal Tractor has done for the following Moline Power Farmers:

"Put the farm on a paying basis."

L. Bonnett, Farson, Iowa.

"It has made farming easier and a pleasure."

Fahy Nisounger, Sidney, Ohio.

"Real satisfaction and enjoyment in farming."

Logan L. Howard, Erick, Okla.

"It has made it possible for one man to do the work of two and sometimes three men. I can plow twice as much as I can with five horses and gang-plow."

Frank S. Wales, Polo, Ill.

"Makes farm life more pleasant."

S. P. Smith, Lovington, Ill.

"Makes farm work more enjoyable. Does away with high feed prices and shortage of labor."

Zimmerman Bros., Earlville, Ill.

"It has placed me above my neighbors, who do not use the Moline-Universal Tractor, for efficient and economical farming."

J. C. Felts, Winfield, Kans.

"Makes farm work much easier. Gives longer time for rest between jobs, and does not take long to do a big amount of work."

J. W. Henry, LeRoy, Kans.

"Solved the farm labor problem. Makes farm work more attractive to our boys."

D. N. Foster & Son, Seymour, Ind.

"The Moline-Universal Tractor is a wonder."

L. J. Wold, Vermillion, S. D.

"It has done everything I have undertaken with satisfactory results."

Wm. O. Misteale, Kendall, Wis.

The Moline System of Power Farming will make your farming more profitable and enjoyable. See your Moline Dealer or write us and you will receive full information.

MOLINE PLOW CO.

MOLINE, ILL.

"MOLINE SERVICE SATISFIES"

PLOWING

DISCING

HARVESTING CORN

FILLING SILO

PLANT ALFALFA THIS FALL.

(Written for Pacific Rural Press.)

The alfalfa crop in California will fall considerably short of normal, due partly to short acreage, and in part to the early drying of fields in our principal alfalfa sections. Short acreage is due to several causes. Not many seasons ago there was a great sacrifice of cows due to dairymen's troubles. About the same time, field crops were demanded by the Government and by high prices. For these two reasons, alfalfa fields were plowed up and planting was greatly reduced. Fields which were not plowed up are now getting rather old for good production and soon they will be put into field crops.

Butterfat and milk prices, present and prospective, seem to justify the expectation that a great increase in alfalfa tonnage will long continue to find a ready market at prices that will bring high interest on investment with but little labor except in harvesting.

While the California alfalfa seed crop is short and that of the Middle West is still in the making, alfalfa seed prices have gone up less since the war started than have most other seed prices.

Fall Planting.

Fall planting of alfalfa has been generally successful where moisture did not freeze on the surface so as to mechanically crush the young plants. Where the surface has been well drained and the seedlings have made three or four leaves before frost, there has seldom been any frost damage in our great valleys.

One case of failure has been pointed out. A man had an alkali field where he hoped the winter rains would so distribute the alkali downward that fall-planted alfalfa might get a good start and make something from the alkaline soil. It didn't work, partly because such a field is generally rather low and therefore too wet during winter.

Fall-planted alfalfa is likely in the

first season to make twice as much hay as if planted the following spring. With such a chance, and with the opportunity of replanting the following spring if the fall planting should fail, and with the recognized advantage of alfalfa in improving the soil's fertility and workability, it seems like a wise investment to plant alfalfa this fall on suitable land.

DON'T LET YOUR NEIGHBOR GROW SANDBURS.

(Written for Pacific Rural Press.)

Sandburs make good cattle feed or sheep pasture—until same days after the burs have formed, as observed by Fred Foiada. That is no excuse for ignoring them, but suggests a way to get rid of them. Plenty of sheep could prevent formation of the burs.

Mr. Foiada paid not much attention to them for several seasons, but is now hiring a man to cut them out before they seed, not only in the fields but especially along ditch banks. He plowed a neighboring field one time, when a regular sod of sandbur plants had formed, but the burs were not yet maturing. The next year more sandburs grew on this piece than before. The seed live over in soil that is turned under deeply, and a field once infested is not likely to be cleared even after several years of careful fighting. If you find anyone on irrigation ditches above you allowing sandburs any encouragement, show him that he is endangering your future prosperity and the future value of your land, because the seeds will float to you. If he does not take immediate control measures, ask your county horticultural commissioner to see about it. The commissioner has authority against noxious weeds.

Products of the Lodi cannery are to be sent abroad in large quantities. Shipping will begin within a month of much of the output, totaling 500,000 2½-pound tins of apricots. Prices for apricots are ranging from \$75 to \$85 a ton, and an average of 1,320 tins is being obtained from a ton of the fruit.

Silage...

Avoid loss—Chop it fine
and pack it tight.
Make SURE of best results by using

The ACME Cutter

THIS STEEL FRAME CYLINDER CUTTER is the most durable, most convenient Silo filler built.

A careful study of Acme construction (faithfully described in our cutter catalog), and a comparison with other cutters will convince you of its superior practicability.

Its low feed table, large open throat, six-arm blower fan, convenient belting arrangement, positive safety device and unusual light power requirements are features experienced users appreciate in the Acme.

You should know all about them. Send for our catalog, prices and terms.

The Combined
Silo Filler,
Hay Chopper
and Alfalfa
Meal Machine

A wide range of sizes to select from.

DE LAVAL DAIRY SUPPLY CO.

61 Beale St., San Francisco

WATERLOO BOY ORIGINAL KEROSENE TRACTOR

Ample, Steady, Self-Regulating Belt Power

is one of the features of the Waterloo Boy which owners have found of great value. Its 14 x 8 inch pulley is driven direct from motor. Belt speed of 2,700 feet per minute is a good average for threshing, silo filling, corn shelling, feed grinding, hay baling, etc. Can be instantly changed to any speed, and is held there by the "old reliable" fly-ball governor in spite of varying load.

For Plowing, Discing, Harrowing, Seeding, Hay Loading, Hauling, Road Grading

and many other draw-bar purposes the Waterloo Boy Tractor is also showing its power capacity; its endurance, fuel economy, quick response to the will of the operator, its freedom from trouble, its ability to accommodate itself to varying conditions.

The Waterloo Boy is a two-speed 12-25 tractor; is equipped with Hyatt Roller Bearings throughout; has dust proof, steel-cut gears, easily accessible, automatic lubrication, reliable ignition, our own patented kerosene manifold which gets full power from every drop of fuel; large, wide wheels give powerful traction without packing soil.

We will be pleased to send you our illustrated catalog which gives full description and many interesting views taken on the farms of users. Write for it.

John Deere Plow Co.
6015 BRANNAN STREET
SAN FRANCISCO, CAL.

E-B 12-20 Horsepower
S.A.E. Rating, Model AA

For Cooling, Only One Pint Water Per Day

NO overheating even though you work the E-B 12-20 AA Tractor all day in tough going. That's because it has unusually large water gasket space, a gear-driven fan and a high-grade radiator of ample capacity. When other tractors of the same rating become overheated and stop work, this tractor is always ready to go ahead.

½-Ton Lighter Than The Average 12-20

Weighs 1000 pounds less than ordinary tractors of its rated power. Constructed almost entirely of steel. Furthermore, the E-B exclusive transmission on Hyatt Roller Bearings insures smooth, complete application of power.

Delivers 25 Per Cent Surplus Power

The rating of 12-20 is given to the E-B AA by the Society of Automotive Engineers—the most conservative rating known. As a matter of fact, this tractor possesses 25 per cent surplus power for emergencies—hard spots, hills, etc.

Any one of the family who can run an automobile, can operate an E-B AA. Its auto-type control and remarkable lightness for its power makes handling easy. All gears, including drive, run in oil and are absolutely protected from all dust, dirt and sand. Every part of the motor's driving mechanism is dust-proof enclosed. Ask your E-B dealer for complete facts.

A WADE does 10 mens work
Saws 25 cords a day!

A money-maker and hard work saver for land clearers and wood-cutting contractors. One man can move it from cut to cut. Simple and reliable. Hundreds in use all over the U. S. When not in use for wood cutting, the 4 H. P. motor will run mills, feed mills, feed cutters, pumps, etc.

"My Wade Saw is cutting wood for less than 3 cents a cord."—F. J. Williams, Burns, Ore.

"I have saved through five feet solid oak logs at the rate of one foot a minute."—N. P. Myers, Loom, Calif.

America must burn more wood for fuel. One Wade will do 10 men's work at one-tenth the cost. Write for free Book, "How Dan Ross cuts 40 cords a day," full details and special price.

349 Hawthorne Ave., Portland, Ore.

Our State Leads in Cantaloupe Production

(Written for Pacific Rural Press.)

California has a large cantaloupe crop of good quality likely to far exceed the early estimate, which indicated a production of about 7,000 carloads, compared to an estimate of 7,000 to 8,000 carloads in each of the three preceding seasons. The Arizona forecast is double that for 1918 and about one-third of the figures estimated for California. Toward the middle of July, Arizona shipments were exceeding those from California which was approaching gradually the end of shipments from the southern part of the state.

Colorado in recent seasons has produced a crop estimated from 1,700 to 2,000 cars annually. The Georgia estimate for this year exceeds 1,000 cars, compared with 486 for last year, but this state approached 3,000 cars estimated production in 1917, and exceeded 2,000 cars in 1916. South Carolina should produce nearly half as many as Georgia this season with estimates of 425 this year, as compared with 159 for last year. Present estimates are about the average of production in 1917 and 1916 for this state. Most other Eastern and Middlewestern sections have declined in production in recent seasons.

Shipments up to July 7, 1919, from all sections were 8,640 cars, of which the Imperial Valley, California, had shipped 4,390 cars. Last year the corresponding date, that section had shipped 4,310 cars out of total shipments of 4,974 cars. The heaviest Middlewestern shipping section is Indiana, which moved 443 cars last year, compared with 664 in 1917 and 794 in 1916. Shipments in 1915 were 638 cars and in 1914 were 1,243 cars. Maryland has shown a decreasing tendency of shipments; the total in 1918 was 490 cars, compared with 855 in 1917, 1,087 in 1916, and 1,011 in 1915. Total shipments from all states in 1918 were 13,297 cars, compared with 17,429 in 1917, with 18,074 in 1916, with 12,637 in 1915, and 16,365 in 1914.

Prices and Markets.

Prices have tended strongly upward in recent years. Values this season, notwithstanding the very heavy crop in California, have been sustained at a fairly high level, although at the end of June the range in consuming markets had declined from opening jobbing prices of \$6.50-12.00 to a general jobbing range of \$2.75-4.00 for standard crates 45's. These are for Imperial Valley Green Meat cantaloupes. Arizona stock in early July ranged somewhat lower than that of Southern California.

The 1918 opening range in consuming markets for California stock was \$9.00-\$10.00 per crate, but the range fell as low as \$1.50-3.00 early in September. In 1917 prices opened at the extremely wide range of \$5.00-15.00 the middle of June, but declined to \$1.50-3.00 the last of August.

California standard crates 45's, as sold in producing sections, opened this season at \$2.25-3.50 early in June, but declined during the month to \$1.50-1.90, afterwards showing a tendency to recover part of the decline. Much of the crop this season was shipped unsold. The 1918 opening range was \$2.35-3.00, and the low price reached late in August was 70-80c wagonload trackside. In 1917 the early price was \$1.20-\$1.90, and the lowest figures were 60c-\$1.35, wagons, trackside, September 3. Colorado Green Meats standard crates 45's were quoted in the middle of August, 1918, at a range of \$1.75-2.25, wagons, trackside; the range fell to \$1.00-\$1.15 early in September. In 1917 the range in early September was \$1.50-2.00 f. o. b. cash track, but values declined the last of the month to a range of 50c-\$1.00. Indiana cantaloupes, standard crates 45's, followed a fairly steady range in late July and the first half of August, 1918, at \$2.50-3.25, declining the week of August 19 to \$2.15-2.50.

Comparison of Prices.

California Imperial Valley cantaloupes at the opening of the season reached top prices in New York City

at \$7.00-\$12.00 per standard crates 45's, compared with \$6.00-12.00 at Philadelphia, \$7.50-10.00 in Pittsburgh, \$6.00-8.50 in Chicago, and \$7.50-9.50 in Boston. Prices were sustained at a fairly high level in New York throughout June, ranging \$3.00-4.50 during the last two weeks, but declining to \$2.50-\$4.00 early in July. The Philadelphia market followed the New York range quite closely, but averaged lower the first week in July at \$2.75-3.00. Pittsburgh started lower than either New York or Philadelphia, but averaged about the same in middle and late June and ranged \$3.00-4.25 in early July. Chicago started lower than eastern markets and averaged lower in June at \$2.50-5.75, but in early July averaged about the same as eastern markets at \$3.00-4.50. Boston averaged somewhat below New York and Philadelphia early in the season, but was ranging higher than either in early July at \$3.75-4.50. Cincinnati ranged about the same as Boston throughout the season.

In 1918 the opening range for Imperial Valley cantaloupes was about the same in all cities quoted, but reached highest in Boston at \$7.00-\$10.00, compared with \$6.00-9.00 in five other leading cities. The range in Boston continued high for the first three weeks, but declined in July to \$2.75-3.50, recovering late in the month to \$4.25-4.50, compared with a range at that time in other cities of \$3.50-4.00.

In 1917 highest opening prices were in New York at \$5.50-15.00, compared with \$12.00 in Philadelphia, \$9.00 in Boston, \$5.00-10.00 in Chicago. During the height of the season there was comparatively little difference in the prices in the various cities, but Chicago and Cincinnati averaged slightly higher than most eastern markets except Boston. At the close of the season in early September, Chicago was the lowest market at \$1.75-3.00; Boston the highest at \$2.50-4.50, and other markets ranged \$2.00-3.25.

The figures above are gleaned by the U. S. Bureau of Markets and furnished to the Rural Press by the San Francisco office.

STANISLAUS BARLEY.

Though a hot spell hit the Modesto Irrigation District barley while it was in the milk and cut both yield and weight, it is still averaging good enough to ship. A dealer recently made a composite sample out of 150 samples of as many lots grown in the District and this average sample showed a weight of 46 pounds per bushel, some light stuff, such as beards having been lost in the resampling. However, it is reported that the dry-land barley outside of the district is even better than this, and is marketing more shipping barley than in any recent year previously. West side barley averages about normal.

Preparations are said to be under way by the transportation companies to deal with the grape crops. Labor and transportation are the only clouds in an otherwise clear sky.

TIRE CONSERVATION COURSE

LESSON 4

Series of Six

How to Care for Fabric Breaks

GOODYEAR
AKRON

Saving 2,000 Miles by Repairing Stone Bruises

A GOODYEAR Tire that looked perfectly sound on the outside blew out one day. The owner, Mr. J. G. Jenkins, of 2106 Maryland Avenue, Louisville, took it to a Goodyear Service Station. Examination revealed a fabric bruise on the inside of the tire—probably caused by bumping into a sharp curb. The bruise had been neglected so long that it had developed into a serious fracture whose edges caught and pinched through the tube, causing the blow-out. The Goodyear Service Station Dealer advised the use of a Goodyear Rim-Cut Patch. With it Mr. Jenkins got 2,000 more miles from the tire.

◇ ◇ ◇

NOT even the thick muscular Goodyear All-Weather Tread can protect the inner plies of fabric tires when cars are backed sharply against square curbs or strike objects at high speed.

In such cases the innermost layers of fabric are sometimes stretched beyond their elastic limit and some of the threads have to break.

The tire is weakened at this point, the fracture enlarges, and eventually the tube is pinched by the jaws of the resulting fabric break and a blow-out follows.

Generally such tires can be satisfactorily repaired.

Goodyear Service Station Dealers and many car-owners use the Goodyear Rim-Cut Patch to temporarily repair such bruises until it is possible to have them permanently vulcanized.

If the tire is too old to be worth vulcanizing, the Goodyear Rim-Cut Patch, securely cemented in, makes

a permanent repair enabling the tire to deliver a great many additional miles.

This most effective inside boot is so constructed that it will repair any possible injury—a cut through the top—a blow-out in the side, or even a rim-cut.

It gained its name many years ago, before Goodyear improvements had produced tires constructed to eliminate rim-cutting.

For Cord Tires the Goodyear Cord Patch is used in the same manner as the rim-cut patch.

Lesson 4 of the Goodyear Conservation Course tells you how to detect and repair stone bruises—ask your Goodyear Service Station for it, or write to Akron.

Suggestive Agricultural Items

(Written for Pacific Rural Press.)

Warehouse Fumigators Needed.

"Fumigated—Guaranteed Free from Insects" is the slogan urged by the State Department of Agriculture for the beans, rice, peas, and grains to be shipped from warehouses after storage this season. Director G. H. Hecke urges use of cement storage, ventilated by wire-screened windows to exclude rats and provided with a fumigation chamber of a carload capacity to permit fumigation with carbon bisulphide for insect prevention.

Bean Imports from Asia.

Imports of Oriental beans by sea into San Francisco for the past year have been as stated below in hundredweights:

1918	1919
Aug. 4,930	Jan. 53,898
Sept. 2,640	Feb. 28,706
Oct. 6,070	Mar. 7,471
Nov. 6,810	Apr. 91,794
Dec. 6,121	May 38,570
	June 12,796
	July (26) .. 12,796

The total this season since January 1 has been 23,323,500 pounds. The 1918 crop of California was about 515,040,000 pounds.

Barley Sales for December Delivery.

A thousand tons of barley for December delivery were sold in nine lots in the San Francisco Merchants Exchange on the morning of July 28, the first lot bringing \$3.37½ per cental and the last lot bringing \$3.40. A hundred-ton lot of barley for May delivery was sold at \$3.46½, indicating that the buyers expect to make a profit on that price between now and next harvest.

December Milo Less Than Spot.

Fifteen hundred tons of milo changed hands on the Los Angeles Exchange in the morning of July 28 at \$3.33¾ for spot milo and \$3.07½ for December delivery. Apparently the new crop is expected to bear down the price when it comes in.

To Reduce Horsebean Weevils.

Fumigation of horsebeans produced in San Mateo County began at six separate stations late in July. Weevily beans bring only half the price commanded by those which are infested only 15 per cent or less. It is hoped that fumigation and burning of the straw will in two seasons reduce weevil infestation so the beans may pass the pure food regulations.

Biggest Sugar Beet Crop Ever.

The total beet and cane sugar crops of the United States during the past six years has been a trifle over a million tons every year except the season of 1914-15. The July forecast

of the U. S. Bureau of Crop Estimates is about 1,108,000 tons. The beet sugar crop is exceeding the record crop of 1915-16 by almost 75,000 tons, and is about 169,000 tons above the average for the six years just passed. The beet sugar of U. S. proper is normally about three-fourths of the total, but poor growing conditions in cane districts and increased sugar beet acreage will have made beet sugar tonnage about six-sevenths of the total this year. The sugar beet acreage this year is the largest on record, being about 890,400 acres. This is 83,800 acres larger than the record planting of 1917 and 200,700 acres more than the 1918 sugar beet area. California sugar beet acreage is less than last year and a considerable amount is producing a poor crop.

Cantaloupe Mosaic Disease.

Cantaloupe growers in Stanislaus County have suffered severe losses this season from a blight which has not been serious before. The trouble, which is different from the well known watermelon blight, has been determined by Professors W. T. Horne and C. W. Woodworth to be the mosaic disease, which has heretofore been most common on tobacco.

Deceptively-Packed Tomatoes Condemned.

The new and expanded fruit and vegetable standardization law went into effect July 27. Deceptive packing must cease. While the old law was still in force, Sacramento County Horticultural Commissioner F. C. Brosius condemned 73 boxes of Merced tomatoes because their top layers were notably better than those underneath. A number of wholesale dealers have had to repack boxes of tomatoes packed deceptively.

BELDI WHEAT YIELDED AND WEIGHED HEAVILY.

(Written for Pacific Rural Press.)

One of the prettiest fields of barley in Stanislaus county last season was a quarter section of the Beldi variety grown on summer fallow by Henry Garrison. While it threshed so easily that it seemed to be "hunting the sack," there was practically no shattering in the wind. It grew tall on big strong straws and as the heads filled, they bent over, presenting only a smooth, even, strawy surface that did not catch the wind nor shake the heads greatly. Figuring out the area taken from the 160 acres by roads on two sides and by two or three rounds made into hay, this barley averaged 3,760 pounds per acre of grain weighing 49 pounds per bushel and of splendid color. There were 4,800 sacks averaging 118 pounds per sack. Mr. Garrison expects to sow twice as much next fall.

Early Seeding—High Yield.

"I lay my good crop largely to the time I sowed it," says Mr. Garrison. "Nine times out of ten the early-sown grain is best. This field was old grain land, a small part of which had grown a crop or two of beans; I summer fallowed it, but last September's rains, followed by warm weather, gave vegetation a great start before seeding time. To get something out of this, I pastured it down with sheep, beginning about the first of October. This may have helped the yield; for a field planted across the road the same time as mine did not go so heavy. I would have begun seeding about November 1, regardless of whether rain had come or not, but the land was in good shape, so we finished seeding in October. Light seeding is best. Last year I drilled 60 pounds per acre. This year, seeding from the plow, I used 65 pounds."

Tractor Plowed and Harrowed.

"Early in October I began plowing the fallow about six inches deep with a 45-horsepower tractor pulling 100 inches width of plows and 100 inches of harrows behind them. I intended to seed from the plows, but didn't

get the seeders on until about 50 acres had been turned over. The other hundred acres was seeded from the plow about three inches deep. This proved slightly better grain than the first 50 acres, which had lain idle a while before drills were put on, giving weeds a start.

The chief objection to drilling, which could easily be prevented, is that if a rain comes after plowing and before seeding, it takes some time to dry out enough for a drill to work, and weeds get a start that the drill does not counteract. Prompt drilling after plowing would generally give the best stand in the best condition."

HUMBOLDT CO. ANNUAL PICNIC.

"Humboldt County is the place for California dairymen to go to school," says Sam H. Greene, manager of the California Dairy Council, who has just returned from that county where he attended the annual farmers' picnic and was among the speakers on the program.

At the picnic the dairymen decided upon three lines of action for the coming year: To start a campaign for new members; to get every herd in the county into a cow-testing association, and to take a bull census and drive every scrub bull out of the county.

Pork Production

BY ACTUAL TEST PURE HAWAIIAN CANE

MOLASSES

will increase pork production approximately five-tenths pounds daily over a barley and tankage feed, yet it sells for less than half the price. Do you know of any other feed at any price that will do this?

Why not get all the profits out of your hogs?

Agricultural News Notes

(Written for Pacific Rural Press.)

Onion and beet seed in Yolo County are being harvested.

Tulare County claims production of 75 per cent of the total state crop of gyp corn.

George Baker of Vina, Tehama County, estimates that his dent corn will go 80 bushels per acre.

The 53rd annual session of the National Grange will be held at Grand Rapids, Mich., beginning November 12, 1919.

The Spreckels Sugar Co. has decided that Stanislaus County is not a favorable field for sugar-beet production.

Ranchers in Fresno County are receiving \$3.10 to \$3.15 per sack for barley which is being shipped to Europe.

Hay is scarce and going up in Stanislaus County. There will be considerable more alfalfa here next year than last.

Fall planting of potatoes in San Fernando Valley of Los Angeles County is about completed. A large acreage seems assured.

The visible supply of wheat in the United States and Canada was 19,356,000 bushels July 23, 1919, as against 11,648,000 a year ago.

The California Vegetable Union is reported to have closed a deal looking to the establishment of a vegetable dryer in Ripon to occupy 1 1/4 acres.

It is reported that the rather extensive tobacco planting near Palo

Alto in Santa Clara County for the past two years has been abandoned for the future.

Grasshoppers are destroying alfalfa in western Stanislaus County. The green fields are attractive and the campaign of poisoning was not begun soon enough.

Copies of this year's program of the Farmers' Short Courses at University Farm are available by writing to University Farm at Davis or the College of Agriculture at Berkeley.

The First Interstate Vegetable Growers' Conference, held at Riverside May 26, is reported fully in the June "Monthly Bulletin," just issued by the State Department of Agriculture.

The Sierra & San Francisco Power Co. has applied to the California Railroad Commission for permission to sell the La Grange Water Rights to the Waterford Irrigation District in Stanislaus County for \$170,000.

The rice planted last spring by the Lincoln Rice Growers Co. in Placer County seems doomed to failure because the P. G. & E., on whose surplus water the growers depended, has not had the surplus to furnish and water is getting scarcer all the time.

Fourteen and a half sacks of Blue-stem wheat per acre was Henry Garrison's yield from dry land in Stanislaus County. He seeded November 1 to 25, as he has observed that early seeding generally increases the crop. He harrowed some of it after it came up.

Prevailing potato prices are only temporary in the estimation of Mr. Hansen, manager for Geo. Shima of San Joaquin county. He expects prices to rise after the southern early varieties are off so that shipments thither will be demanded from Stockton or other points.

Frank Lyons, who is growing some onion seed in the Delta of San Joaquin county, says that while it did rather poorly because of cold wet weather early in the season, it will make a better crop than last year.

Cotton acreage in the San Joaquin Valley is reported by Robert Hulme of the California Products Co. as 985 acres short staple and 215 acres long staple in the Bakersfield district, 1400 acres short staple in the Corcoran district, 4,056 acres short staple and 70 acres long staple in the Fresno district.

Early Baart wheat made a crop in several cases where barley planted under the same conditions failed, as observed by Mr. McGinnis of the Los Banos department of Miller & Lux. He says large acreages of the Baart will be sown in that district next year because of the specially good yield this season.

"MORE AND BETTER WHEAT."

Reestablishment of a great deal of California's former prestige in wheat growing largely through a campaign carried on for that purpose by Geo. R. McLeod of the Sperry Flour Co., and during which several more-valuable new varieties have gained distribution, was recognized July 24 by the Farm Owners' and Operators' Association in a resolution expressing the gratitude of California farmers to Mr. McLeod and to E. J. Luke, under whose directions Mr. McLeod has worked.

ASK FOR ILLUSTRATED FOLDER NO. 25

The Right Belt--"Test Special"

Does your belt separate?

Do the plies pull apart and ravel at the edges? A Test Special won't. A Test Special Belt is guaranteed not to pull apart. If it does we give your money back.

The life of any belt is in its plies. As long as they stick together and pull as one your belt will wear and give service. But once they separate your belt will soon go to pieces. The friction between loose plies, as they revolve around the wheel, does more to lessen the life of Belts than any other thing.

Try this little experiment with a Test Special.

Take a small strip of Test Special Belt, say one inch wide; separate the plies with a knife and then endeavor to pull the plies apart. Note how strong and elastic the Rubber Friction. This is a good "test" to determine the worth of a belt.

The plies of Test Special Belts are guaranteed to stay together. We back this guarantee with 73 years of successful and honest dealing with belt users throughout the United States.

Test Special is a belt you can depend upon. It is a guaranteed belt of long service.

The LAUSON Wins Again

The position of the driver's seat is adjustable and a riding spring makes it easy for you to drive your LAUSON all day without feeling fatigued. Notice there is both a rigid and swinging draw bar.

at Newell, South Dakota.

Five selected tractors were entered in a plowing contest on the farm of C. A. Gerlach, Newell, S. D., and honors again went to the LAUSON on the following counts—

First in performance in the field—
Best job of plowing—
Ease of operation—
Least fuel consumption—

This is the kind of "show-down" the LAUSON always makes in actual field operation. Results are equally good on belt work and hauling.

You cannot afford to buy any tractor until you have a LAUSON demonstrated on your farm. New literature just off the press tells why the LAUSON is "The Pattern Tractor of the Industry."

The New 16 valve Twin City Tractor PAYS BIG DIVIDENDS

For the first time in the history of the tractor industry, the 4-cylinder, 16-valve engine (valve in head type) is now applied to a tractor. The TWIN CITY 12-20 with its 16-valve motor actually develops 25 per cent more than its rated horsepower.

This new 12-20 is a light weight tractor that will out-pull, out-last, and out-dividend other tractors of equal rating.

Not built down to a price, but built up to a fixed ideal—to do the work assigned to it better than it has ever been done before.

The highest grade tractor will unfailingly prove the least expensive and pay the biggest dividends.

Tractors Work Fast on Reclaimed Island

(Written for Pacific Rural Press.)

Bouldin Island in the Delta of San Joaquin county was in 1906 one of the most fertile 6000-acre garden patches in the country. Celery, asparagus, truck crops, strawberries and dairying thrived on its sediment peat soil which had been deposited and built up by centuries of silt-laden floods. Men had waved the magic wands of dredger-booms and the waters had been held off. But in 1907 came a flood that would brook no control.

Since then this garden spot has been under water. But by last May 31, enough had been pumped over the levees so that three or four thousand acres saw the sun once more. Forty-inch pumps continued to throw out the millions of gallons that were left.

Geo. Shima had leased the island. May 31 was getting rather late to begin preparing for crops. Mr. Shima had 400 head of work stock available, but that was not enough; and anyhow there were many low places where horses could scarce pull themselves through the mud without attempting to pull a plow. Here is where tractors, a flock of fifteen of them, varying in size from 75 horsepower engines down to some of the smallest tractors made, came to the rescue. Tractors weighing several tons plowed those soft spots far better than horses could. Being sediment soil with some sand mixed in, the wet-plowed spots did not bake badly and a total of 3,500 acres of beans had been planted by July 10.

Fine for Seed Potatoes.

Shima's "Red Bank" Burbank potatoes are famous for their quality and command a premium on the markets for two reasons. They are graded and all except those of Red Bank quality are put into plain sacks. But

as many Delta potato growers have learned through losses, the production of quality potatoes begins back of the grading. On the Shima projects it begins in the acreages specially selected this year to grow seed for next year's planting. Such seed acreages must be on soil free from potato diseases and insects. So it was highly desirable that Bouldin Island, where the water had starved whatever diseases may have existed there, should be used for seed potatoes to be planted on Mr. Shima's other island fields. Had it not been for the tractors, it is doubtful if they could have been planted in time. About 800 acres are being planted to potatoes for seed at the present writing.

An idea of the rush nature of the work can be gained by noting the fact that although there were about 200 men on the job, according to Mr. Ito, there was no time to build camps for the men, but they were housed and fed in boats. There was no time to dig a seepage ditch around the island inside the levees. Such a ditch catches the water that continually seeps through the levees and prevents waterlogging of the planted areas. It is convenient to pump out of these ditches over the levees. They are being dug now that the crop is mostly planted.

Tractors of at least five different makes were used, some of them being owned and some hired for the job. Seventy-five horsepower tractors cost \$4.50 to \$5 per hour and were able to pull 126 inches width of plows where the land had partially dried off before plowing. The 45-horsepower tractors with extensions on their tracks pulled four fourteens on land where horses or mules mired their four feet one or two feet deep.

OLD TRACTOR PERFORMS FOR CROWDS.

The first tractor of a certain make was built over ten years ago. It has plowed 1,750 acres of wild prairie sod and 5,600 acres of stubble. It has operated a 40x62 stationary thresher 321 days threshing 750,000 bushels of grain. It has done many odd jobs including a lot of road work. After so much of prosaic toil, it was fitting that this tractor should be shipped to the Wichita national demonstration held recently, where it was permitted to show off to the crowds that marvelled at its ability after so long and useful a life. Tractors will serve long and faithfully if not abused.

TRACTOR PUMPS FOR ORCHARD.

A 6-10 h.p. tractor and four mules furnish the power with which Howard Huls of Stanislaus county works about 39 acres, mostly of orchard and bean land, besides some outside work. This tractor is one of the first ones put out by an old established California concern, yet it is giving fine satisfaction this summer, all improvements having been added to the old machine as they became available.

But plowing, harrowing, and disking do not end the season's work for this tractor. A centrifugal pump is set in the irrigation ditch to water a high part of the orchard and the tractor runs the pump. At this season of the year when no gravity irrigation is possible, but when the trees are morally certain to need water in order to prepare for a crop next year, the pump can be set in a tule pond on the place and again the tractor will have an important part in making better crops next year.

POWER NOTES.

The farmer who hires a man to roll baled hay onto the wagon might well profit by the experience of the one we recently saw loading onto a motor truck faster by means of a light derrick.

A motor truck was recently seen moving a house so big that two men had to ride on the roof to transfer wires and cut limbs of trees along a Santa Clara county highway. The house had been placed on big rollers and the truck was pulling it steadily along the highway.

The Emerson-Brantingham tractor agency for territory north of Fresno is now in the hands of Goodrich, Ballard & Rouse of Sacramento. Brock & Skidmore retain the agency south of Fresno. The G. B. & R. Co. will have 2,000 square feet of exhibit space in the tractor tent at the State Fair.

Up in Butte county a farmer had used his two-cylinder tractor all morning; but in the afternoon he found that while it would run around the field nicely alone, it would give up the ghost whenever the plows were dropped into the ground. A spark plug porcelain had cracked.

The automobile engine persisted in unaccountably overheating and boiling away the water too fast. Finally it was discovered that joints in the spark control had become worn and loose so the spark lever could be advanced several notches before it would affect the timer. The engine overheated because of the slow spark.

Small Tractor Hauls Nine Tons of Grain per Load.

Two men and a tractor totaled one man more than enough to haul 17,600 pounds of barley per load 5½ miles over country roads to the warehouse from the ranch in Solano county. W. H. McElwain and his tractor driver were the two men, the former making the trip simply to help unload at the warehouse and to watch the loads. The tractor train which hauled this grain consisted of a 12-20 tractor and three wagons. It traveled at the rate of 2¼ miles per hour and made two trips per day. The total load including wagons was figured to be over ten tons.

Has the Farmer any Opinions of his Own

AFTER listening to the arguments with which some tractor salesmen try to convince him, you might suppose that the farmer never did any thinking for himself.

You will hear them telling him how many wheels his tractor ought to have, or what it ought to look like, or some other inconsequential detail—appealing to his eye instead of his intelligence.

Now, the farmer is a practical man.

He is looking for facts—not theories or impressions.

He is looking for a tractor that will do his work, and do it economically, and last a long time.

And the more critical he is, the more determined to get at the facts, the quicker he comes to the G O Tractor.

For eight years the G O Tractor has been the standard among practical farmers all over the country. Because of its advanced driving mechanism, it is the easiest tractor on the market to control and the most economical to

operate. It has six speeds forward and six reverse—a right plowing speed in any sort of soil; a right speed at the belt for any kind of machine. It is the most powerful tractor in America for its weight.

Years are added to its life by the dust-proof casings on its gears. It was the first tractor to enclose its gears in an oil bath. It has no gears or chains on the traction wheel to be cut by sand and gravel.

The G O Tractor is the four-wheel, four-cylinder type—the simplest and most practical type of all. Every part of the motor and driving mechanism is instantly accessible. Adjustments can be made by anyone right on the ground, without the aid of special tools.

The farmer with a practical mind, who is looking for indisputable facts, and good sound horse-sense—not “talking points”—we shall be glad to send some further information about the most advanced tractor in America and about the company behind it—its guarantee and the service that goes with it.

More Water Means More Milk

(Written for Pacific Rural Press.)

"Water the cow and you'll water the milk," is the slogan of a progressive dairyman. This is no variation of the old joke about the milkman watering milk. It is a serious appeal to reason, backed by hard, cold facts, for comparisons show that cows properly watered give at least 4 pounds of milk more per day than those that do not have a plentiful supply—often considerably more than this.

The water supply is a matter of just as much importance as the feed supply. Milk analyzes about 87 per cent water; consequently a lack of water has its effect on the amount of milk that can be produced. Experience has shown that where water is constantly before the hard-working cow she drinks a good many times during the day, and takes small quantities at a time. Even when consuming succulent feed she takes a few mouthfuls of water. Evidently Nature tells her that this is the best way for digesting food and producing milk.

Contrast this condition with the lot of a cow that is given access to water only once or twice during the day, and perhaps has to fight her way up to

the trough. Often the timid animals in a large herd get less than they really should have, while no cow, it has been demonstrated, will take as much in this way as though a clean, pure supply were constantly before her.

In experiments it was found that cows producing 25 pounds of milk a day required 75 pounds or more of water, and there were instances where cows consumed more than three times this amount. One cow giving over 100 pounds of milk was found to drink 250 pounds of water, but she had access to it at all times or she would not have been able to make such a high record.

Some farmers force their cows to drink water from dirty, slimy troughs, or from stagnant pools—water they wouldn't wash their hands in. Sickness does not always follow, although it generally does. The cows may be strong and healthy enough to fight off the attack and survive. But even in such cases, strength and vitality needed for the normal life of the animals are used to combat the bacterial assault, and, though death and sickness may be avoided, weakened vitality is inevitable.

Cows, just like humans, demand palatable water. Clean, pure, cool water, supplied at all times, encourages them to drink more freely. And the result is an increased flow of milk, and a better condition of health. Try it and see.

THE POPULARITY OF GUERNSEYS.

That Guernseys stand high in the estimation of American breeders is proved by the fact that there were more Guernseys imported into this country last year than animals of any other dairy breed. This breed combines beauty with usefulness, and has won over all other breeds in the net profit from butterfat production and the greatest returns for every dollar invested in feed.

Here on the coast the Guernsey is very popular, but it has been almost impossible to secure high-class females for foundation stock. The Palo Alto Stock Farm, for instance, has one of the finest herds in America, but until now you couldn't induce Mr. Tichenor to set a price on one of the good cows. However, this establishment has grown to such extent that it is no longer possible to give the herd proper attention, and it has been decided to disperse the entire herd at private sale. We are sorry that it is necessary to break up this noted herd, and we hope that all of the animals will find new homes within the State. California cannot afford to let such cattle go outside of her boundaries.

THE DAIRY FARM MOVIE.

Picture 1—The hero, a bold but rash hired man, is prone on the ground and a so-called "gentle" bull is about to butt him into the middle of next week. Exercised neighbors are running to the H. M.'s aid, armed with pitchforks, brooms, etc.

Picture 2—The gentle bull is retiring into the distance with a baffled look on his expressive countenance. Others have translated that look as meaning "better luck next time." The brave hired man is toted homeward in a wheelbarrow, while sympathizing friends whisper, "Oh, dear!"

Picture 3—The injured hired man is on his bed in the act of deciding whether he will live or die. Around him are nurse, doctor, breeder and family. (Soft music.)

Picture 4—The H. M. decides to recover; orders the Boss to his bedside and tells him he'll quit his job if he doesn't order a bull staff by return parcel post.

Picture 5—The Boss has received the nice new bull-staff and is practicing on the gentle bull with it. He likes it so well that he says he won't let hired men run any more risks, as it is better to pay \$5 for a bull-staff than \$200 for a H. M.'s sick bill.

Moral—A dairyman who has to keep hired help can't afford to run gentle bull chances.

Sheep require but little care if given abundant range in summer, sufficient exercise and dry quarters in winter, and pure water and good feed at all times.

Texas fever has again made its appearance in the San Joaquin Valley, and sections of Kings and Tulare counties have been quarantined. Cattle cannot be moved from these sections without first being inspected and certified by Dr. George Gordon,

Hanford, unless they are for immediate slaughter, and even then certain rules must be observed. Those suspecting the disease in their herds or intending to ship for other purposes than slaughtering should consult Dr. Gordon, and secure valuable advice.

GUERNSEY DISPERSAL SALE

Greatest opportunity ever offered Coast breeders to secure foundation stock of this wonderful breed, noted for the most economical production of milk and butterfat, as well as the best flavored and highest natural colored products.

Heretofore most of the animals in our herd have been held above price, but now, because of the rapid increase of our business along other lines, we are compelled to disperse this entire Guernsey herd, which we believe cannot be surpassed anywhere in uniformity of type, health, breeding and production.

100 Head at Private Treaty

Everything goes; not an animal reserved. There are 83 females of great production and promise; 17 males that are real herd headers. Twenty-one of the cows have Advanced Registry—official yearly records of from 500 to 800 pounds butterfat, and several more are now on test.

If you want show quality as well as heavy production, you will find them here. The herd includes the grand champion cow and the junior champion bull at the last San Francisco Show, and many young animals fit to win in the hottest competition.

FEMALES OF GREAT PROMISE

While a good share of the mature females have been given records, they have not been forced, and there is not a cow in the herd that has shown her limit of production. Also many of the untested cows give promise of making even better records than the ones already tested.

BULLS FOR BREEDING UP

Guernsey bulls quickly build up grade herds. They are so prepotent that they stamp the breed characteristics upon their offspring to a marked degree, and soon you have profitable producers of quality products. We offer some royally bred young bulls that will quickly double the profits from your herd.

Your Opportunity—Act Quickly

The sales list is completed and we are ready to sell. Breeders know how difficult it has been to secure good Guernsey stock, and will jump at this chance. Don't put the matter off. If you want foundation stock for a registered herd, new blood for an established herd, exhibition stock for the fall shows, or a bull to breed up a grade herd, come at once and make your selection. If you can't call, write your wants fully. But don't delay.

Duthie-Bred Shorthorns for California

(Written for Pacific Rural Press.)

We are pleased to present a picture of the Shorthorns purchased at the recent Carpenter & Ross sale by the Thos. B. Dibblee Estate of Santa Barbara and T. S. Glide of Davis, as related in our issue of July 19.

The cow and calf go to the San Julian ranch, owned by the Dibblee Estate. The cow, Imp. Bright Bessie

by Mr. Glide for his Hillcrest Stock Farm. He was sired by the Duthie bull, Lord of the Ring. He is a smooth, snappy red; a bull of great size, type and finish, and surely will make a name for himself at the head of Mr. Glide's noted herd.

The animals have already arrived and are doing well in their new

of Collynie, is a 5-year-old by Knight of Collynie—a straight Marr Bessie. There are only about eight Duthie-bred cows in America, and it is believed that this is the only one ever brought west of the Rockies. Her calf is by the great Carpenter & Ross bull Maxwalton Minstrel.

The yearling bull, Imp. Scottish Lord, is her son, and was purchased

homes. California is proud to have such fine stock within her borders. It means much to the entire beef cattle industry of the State.

SAN FRANCISCO LIVE STOCK SHOW PROGRESS.

President W. T. Sesnon has announced the following committees for the California International Live Stock show, to be held at San Francisco, November 1 to 3, inclusive: Finance—B. F. Schlessinger, chairman; M. H. Esberg, R. B. Hale, C. K. McIntosh. Classification—F. L. Washburn, chairman; T. W. Dibblee, Frank Honeywell, W. M. Newhall. Transportation—A. W. Foster, chairman; F. L. Washburn, R. B. Hale. Buildings and Grounds—M. H. Esberg, chairman; B. F. Schlessinger, R. B. Hale, F. L. Washburn. Publicity and Advertising—Frank Honeywell, chairman; B. F. Schlessinger, M. H. Esberg. Admissions—C. K. McIntosh, chairman; A. W. Foster, W. M. Newhall. Concessions—R. B. Hale, chairman; W. H. Esberg.

Prof. True, the manager, is working to get the classification lists ready for the printer very shortly, and expects the premiums will total about \$35,000. He also is working out plans for putting on a horse show each night of the week of the live stock exhibit.

EVERYBODY GOING TO UNDERHILL SALE.

The Hampshire hog has taken California by storm. Walter Folk, the hustling representative of the Hampshire Association, has been touring the State, and everywhere he finds a keen interest in this breed that is so popular with the packers. Everywhere he finds farmers just ready to make a start with Hampshires.

They will all be on hand at the big Underhill sale at Santa Barbara Wednesday, August 6th, when 65 head of bred sows and gilts, selected from the \$25,000 foundation herd, will be offered. Talk about quality—here they will find it. The right start puts a beginner half-way to success, and the one who selects his foundation stock at this sale will be pretty sure of a prosperous future. Col. Ord L. Leachman will be in the box. Great sale—let's go.

HUMBOLDT DAIRYMEN AGAINST DAYLIGHT SAVING.

At least one group of farmers have seriously protested against the monkeying with the clock at Washington. The Humboldt County Dairymen's Association was unanimously against it, and you can understand why when you stop to consider that Humboldt is noted for its abundance of fog and

Simplicity of the DE LAVAL

During hot summer days, simplicity in cream separator construction avoids waste and makes possible quick and easy handling of milk.

The DE LAVAL Cream Separator is remarkably simple. Thousands of DE LAVALS are run and cleaned by children every day.

This simplicity means long life and freedom from repairs, and is the outcome of over forty years of unquestioned

leadership in cream separator inventing, developing and perfecting.

Every part has been developed to its highest degree of simplicity coupled with efficiency and the DE LAVAL has earned for itself the name of being "the world's standard separator."

More DE LAVALS are in use than of all other makes combined

See the local De Laval agent, or, if you don't know him, write to the nearest De Laval office as below

We Have for Sale Some Great Young Bulls

from Prize-winning dams and sired by our twice Grand Champion Bull, King Segis Alcartra Prilly, or our Senior Sire, King Segis Alcartra Abbekerk, whose three only daughters to freshen average on official test over 21 lbs. butter in 7 days at an average age of 22 months.

BRIDGFORD COMPANY, Knightsen, Calif.

scarcity of sunshine during the early part of the day.

Can you point out one industry that has economized on fuel and energy that would not have done it by other methods than moving the clock? If you did not hear the protest of the California farmers against the act,

it must have been on account of the noise of the cities for it.—J. W. Cop-pini, Ferndale.

Dogs have their place, but it is not around dairy cattle. It means an actual loss of milk for cows to get excited from fear or anger.

Live Stock Profits

are directly dependent upon the general health of herds and flocks. Not all live stock diseases can be controlled or cured, a fact that justifies owners of livestock taking advantage of every proven method for eliminating possible risks.

PURITY BIOLOGICAL PRODUCTS (not always cheapest but always best) offer the greatest protection against certain diseases.

Purity Blackleg Aggressin—Germ Free Vaccine—produced by the Kansas method. One treatment immunizes for life. Being germ-free its use will not introduce blackleg into healthy herds. Over 1,500,000 calves vaccinated without loss.

Purity Anti-Hog-Cholera Serum is the most extensively used in the world.

Purity Mixed Vaccine for Swine prevents Swine Plague and Necrotic Enteritis.

Purity Hemorrhagic Septicemia Vaccines for cattle and sheep prevent Hemorrhagic Septicemia and reduce losses in infected herds.

We are prepared to offer the highest degree of service—service that counts, and does not end with selling. Correspondence and consultation invited. Write, wire or phone.

HOLSTEIN HERD
AVERAGES 18,812
LBS. MILK.
Near Big Bay, Mich.,
is a herd of thirteen
pure bred Holsteins.
Last year the average
yield per cow of this herd was 18,812
lbs. of milk and 638.57 of fat.

Do you realize the money there is in
such cows? It is estimated that the aver-
age animal yield of all cows in this coun-
try is under 4,000 lbs. These thirteen
cows produce as much milk as sixty-two
cows of the 4,000-lbs. class. It would re-
quire twenty-eight cows giving 8,500 lbs.
be equal their output. Why feed, milk and
shelter any more cows than you need to
produce the milk you require?

Pecho Pigs and Cows.

A. B. Spooner & Sons, owners of
the Pecho Ranch & Stock Company,
have dairy cattle, hogs and sheep in
large numbers on their 8,000-acre
ranch near San Luis Obispo. About
1,400 acres are farmed, producing
large quantities of volunteer hay, In-
dian corn for silage and other crops.
The pasture is excellent the year
around, due to plenty of moisture
from fogs and rain.

Registered Holsteins of good type
and excellent performance are the
chief pride of the ranch, although with
50 head they think they are only
commencing when the large area of
the ranch is considered. Their young
herd sire, Pecho Pontiac De Kol, is a
very promising son of King Korn-
dyke Pontiac and Flossmor Corinne
De Kol, with a record of 27.09 pounds
in 7 days and 815.38 pounds of but-
ter in a year.

Fifteen brood sows comprise the
foundation of their Poland-China
herd, with a son of Major Hadley as
a herd sire.

Melone Memorandums.

The Oak Knoll Ranch, Napa, owned
and operated by the Melone Co.,
consists of 2,200 acres, much of which
is cultivated land and has been in the
Melone family for three generations.
It is devoted to fruit, livestock and
grain. The livestock end of the busi-
ness is represented by registered
Chester White swine, and a dairy
herd, the foundation of which is reg-
istered Ayrshires.

Dice has "Right Type" Polands.

When it comes to big Poland-
Chinas, having quality and the char-
acteristics that make for quick-grow-
ing and maturing animals, W. T. Dice
of Hanford seems to be on the right
track with his "Right Type" strain.
An October gilt, sired by Giant Long-
fellow and dam out of Fessie's Timm,
is a half-sister of the sow that weighed
925 pounds at the National Swine
Show. She is sure to please the most
fastidious. Three others sired by
Bower's Mammoth Joe out of a sow
sired by Miller's Giant Orphan, are
classy and along the lines that look
good to Poland-China fanciers. The
names of many famous eastern
breeders are found in the pedigrees
of those animals, such as Hather,
Sevier and others.

Doddies at Eldersly Farm.

One of the great beef breeds of
"auld Scotia" that is gradually creep-
ing into California is the Aberdeen-
Angus. To those who are not ac-
quainted with their chief character-
istics it may be said that they are
polled or hornless, black, low-down,
blocky, uniform in appearance, and
furnish meat of the highest quality.
They are popular with the judges of
carload lots and give an excellent
account of themselves at the block.

J. H. Ware of Live Oak has a very
good herd started with Eldersly Prince
as herd sire, Sciota Coquette, grand
champion cow of the breed at Sacra-
mento in 1917, and others of good
types of the breed. Mr. Ware keeps
them in good breeding condition, but
not in the extreme-show form. These
cattle are kept in connection with his
fine herd of Poland-Chinas.

Hartsook's Livestock Trio.

Talk about intensive methods—just
go down to the Hartsook Ranch at
Lankershim, and you will see them
practiced to the limit. Here on 35
acres is maintained a string of 17
milking registered Holsteins besides
some young stock; 60 Poland-China
hogs, and 80 Toggenburg goats, 20 of
which are milking. This ranch is sup-
plemented by a 2,500 acre ranch at
Cantil, where Mr. Hartsook sends his
calves after they are weaned and
lets them rough it until breeding time
so as to develop strong constitutions.

The Holsteins include many high-
record cows and the swine herd has
been such a consistent winner at dif-
ferent shows that little need be said
about it. However, the new boar, Big
Smooth Jumbo, is all that his name
implies. He is a real thousand-pound

boar with big bone, a strong back and
great depth.

The goats are easily kept and are
fed on almost anything that is clean.
The milk retails readily at a high
price because there is no danger of
tuberculosis, as goats are absolutely
free from this disease. The ranch is
now in charge of T. C. Law, who is
reorganizing it, and promises to be-
come a most efficient superintendent.

Jottings from Jeffries' Ranch

Ninety head of registered Holsteins,
32 of which are milking, and another
string of grades, all in the finest
working condition and producing 23
ten-gallon cans of milk daily, speak
well for the management of H. A.
Koch, superintendent of the James J.
Jeffries Ranch at Burbank. And all
this on 105 acres in alfalfa and silage
corn. The Holsteins are of fashion-
able strains and high performance; the
buildings are of the highest class from
the dwelling down. Fertility is con-
served by the practice of never sell-
ing any of the fertilizer.

The young 2-year-old bull, King
Lyons Belle De Kol, out of the 30.64
pound 3-year-old Fiebe Canary Belle
De Kol, is a wonder and if his prog-
eny equal his ancestors they will
make a valuable addition to the herd.

Adohr Stock Farm.

Here in the famous San Fernando
Valley on the Ventura Boulevard is
an up-to-date ranch given over en-
tirely to the production of certified
milk for the city of Los Angeles. The
cattle are high-grade Guernseys with
a sprinkling of registered stock. Spe-
cial pains are taken to have the cattle
absolutely healthy and all rules laid
down by the Los Angeles Board of
Health are strictly followed. The
cows are excellent individuals as well,
having several crosses of Guernsey
blood and are true to the breed type.
A recent shipment from the East
brought the total number up to 350,
which we believe makes the herd the
largest of this breed west of Chicago,
and still the demand for their certi-
fied product is so great that 100 addi-
tional cows are needed at once.

The Adamson Corporation, which
owns and operates the farm, has
taken front rank among dairies fur-
nishing such milk to Los Angeles.
In the so-called "contests," during
which "surprise" samples of milk are
taken from the dairies, this farm has
stood first with a score of 97 and 97.4
out of a possible 98 in the two con-
tests in which they have been in-
cluded. More than that, of all babies
fed Adohr milk during the past 11
months not one has been sick.

Fortunes from Few Acres.

Intensive methods are employed in
the rich San Fernando valley, and al-
though many of the ranches consist of
only 5 or 10 acres, they carry more
stock and yield more profit than
ranches in other sections of many
times the acreage.

L. W. Serrell, at his Liberty Ranch
near Van Nuys, makes a paying propo-
sition of Durocs and ducks. Durocs
are also found at the Swett Ranch,
where there are 17 outstanding brood
sows of Orion Cherry King breeding.
L. R. Hitchcock has walnuts and
pears, and between the trees he grows
all sorts of feed for his Durocs. He
has 5 choice brood sows and intends
to enlarge the herd to 10. Hewitt
Bros. have a great herd of Durocs
headed by Top Sensation 1st, a grand-
son of the 1,200-lbs. Great Wonder I
Am. Judge J. C. Craig, another Duroc
breeder at Owensmouth, has an Ohio
chief sow that has farrowed 4 litters
in the last two years, totaling 37 pigs,
of which 25 were sows. L. Leest has a
combination of Durocs and White
Leghorns at Van Nuys. His pigs are
very thrifty. One sow pig weighed
67 pounds when 8 weeks old and
three boars averaged 65 pounds at
the same age.

The average production of wool in
the United States is around 270,000-
000 pounds; the annual consumption
is over 600,000,000. Not much danger
of an over-production.

*Comes to you labeled with a tag showing
analysis and ingredients.*

Our cards are on the table, Besgrade Dairy Food is an
open book.

When you buy Besgrade Dairy Food you know just
exactly what ingredients go to make it. You know its
analysis and that it is scientifically balanced to produce
milk and at the same time maintain the cow's body re-
serve for heavy milk yield all the year, not for only a
short period.

We build our feeds on a scientific basis and are willing
to stand by results. What the dairyman wants is the best
result per dollar obtainable—and we guarantee it.

We have prepared a pamphlet giving the name of every
ingredient used in its manufacture, the analysis of it and
why you cannot afford to make it yourself. Clip the
coupon and mail. A copy of this pamphlet, also a copy
of the new feed law, will be mailed to you immediately.

Besgrade Dairy Food not carrying this new tag has been
manufactured previous to this date, but analysis is the
same as shown on tag or in pamphlet.

GREAT WESTERN MILLING CO. LOS ANGELES, CALIF.

GREAT WESTERN MILLING CO., Los Angeles, Calif.

Please send me your pamphlet on Besgrade Dairy Food, showing analysis and
list of ingredients used, and its advantages in feeding. Also a copy of the
new feed law.

SIMPLEX SILO

Double Your Dairy Profits

Suppose you had some means of providing a nutritious green feed for your dairy—summer and winter. And suppose it would save you time and worry, enable you to secure double your yearly profits. What would it be worth to you? It would be the most valuable thing on your farm, wouldn't it.

That's just what the "Simplex" Silo will do. The "Simplex" is more than a silo. It is the perfect silo. It will last longer, make better ensilage and give more all-round satisfaction than any other. You will never know what a silo really is until you have wouldn't it?

Construction of the Simplex

The "Simplex" silo is constructed of two things—**perfect lumber and common sense.** A silo built of spliced staves will leak. Why? Because it is impossible to join two staves and make the union as solid as the wood itself. Therefore the "Simplex" **has no joints. Staves are one piece.** No chance for a leak. Extra heavy tongues and grooves with new steel hoops make the "Simplex" an ever solid silo.

The Interlocking Anchor System and the Crisell Tangent Top keep the "Simplex" always in a true circular outline. Absolutely will not sag, twist or blow over. Write for blue prints of the "Simplex." Get our illustrated circulars and find out more about how to increase your profits.

Why wait for your neighbor's ensilage cutter while your crops are spoiling in the fields? A week or even a day may mean a loss of several hundred dollars to you. **Own a "Papec."** Have a cutter when you need it. Fill your own silo at the right time.

The "Papec" is built strong. Solid steel frame. Easily and quickly taken down and put together. Knives and fans are on one wheel. It operates with less power than any other. We guarantee it to cut and elevate more ensilage than any other cutter made with the same power.

Let Them Make Money for You

The Simplex Silo and the Papec Cutter are a money-making combination. We guarantee both to be as we claim. Prompt refund of purchase price if either fall short of our statements. Write for descriptive matter. Let us show you more about the "Simplex" and the "Papec." Write today.

Livestock and Dairy Notes

Livestock breeders all over the state are invited to send on postal cards, notes regarding their sales, State and County Fair intentions, new stock, etc.

The Dairy.

J. M. Christen of Oakdale Holstein Farm, Pacheco, has recently sold a bull calf to Ira B. Killgore, Concord, and another to James Smith, Martinez.

A. M. Bibens, Modesto, has sold a Holstein bull calf to the Los Angeles Creamery Co., and one to the Crescent Creamery Co. of Los Angeles.

C. Tamagni, of Vina, besides feeding 110 cows, will sell 200 tons of hay from his 135 acres of alfalfa, his third crop averaging fully 2 tons per acre.

At last we are to have a "Who's Who" for grade cows in a new Record of Production which has been started by the University Farm. Full particulars will be given next week.

Bloomer's Queen is the new Ayrshire queen of the milky way, having broken the senior 4-year-old record by producing 856.41 pounds fat from 21,820 pounds milk. She is owned by Penshurst Farm, Pennsylvania.

W. G. Strader of Ceres, well-known breeder of Dutch Belted dairy cattle, died last week. His herd will probably be kept intact by his wife and daughter, who are experienced with these cattle.

H. E. Spires of Hillcrest Farms, Carruthers, reports recent sales from the Victory Holstein herd as follows: Two heifers to Lewis Bros., Riverdale; heifer to C. H. Boyd, and young bulls to Mrs. Ida Abbott, Lemoore; A. A. Malsbury, Riverdale; and J. H. Ginn, Riverdale. All of these bulls were sons of the herd sire, Sir Piebe De Kol Segis Pontiac.

Edgemoor Farms, Santee, have in quarantine in New York two Guernsey cows recently purchased in England. As soon as they are released they will be shipped direct to Edgemoor, together with three others purchased at the New Jersey sale. Mr. Dupee ex-

pects to show a herd in the East this fall where in the past he has made many notable winnings.

Woodhead-Warren Ranch at San Jacinto, Jersey breeders, have some high-producing cows among their grades. One produced 292 pounds butterfat during the last six months of her lactation period. Ten cows, out of 32 in the cow-testing association, produced over 40 pounds butterfat in 30 days. The whole herd averaged 36.54 pounds.

L. B. Van Blaricom, the Holstein breeder of El Monte, has a very good cow in Hillview Cornucopia Johanna, as she produced \$720 worth of milk last year and her bull calf sold for \$250 as soon as dropped. Mr. Van Blaricom sells whole milk in Pasadena and his 18 cows averaged between 45 and 50 pounds of butterfat each during the months from February to June inclusive.

C. G. Marchus of Escondido is starting a herd of registered Jerseys, although he has some very good grades. The cows averaged three gallons of 4.8 per cent milk from January 1 to June 1. Mr. Marchus is a director of the new cow-testing association just formed in San Diego County, including 30 herds and over 800 cows. That means progress.

Beef Cattle.

Cattle in the hills around Livermore are generally in good fat condition, but many of the hill springs are drying already, so that water is scarce for pasture stock.

A Glenn County Shorthorn Cattle Breeders' Association has been organized. The association will arrange for an exhibit at the Glenn County Fair at Orland.

One of the best junior Shorthorn calves seen this year is owned by F. L. Hall, of Rose Crest Ranch at Perris. This calf is out of a Knight Templar dam and sired by Avon's Glory. He has the straightest top line ever, and is very well covered for a youngster that is growing so rapidly.

Swine and Swinemens.

H. E. Spires of Hillcrest Farm, Carruthers, has sold a Duroc boar to Jesse B. McMillip, Fresno; 4 gilts to Jones Bros., Carruthers; 10 gilts and a boar to C. R. Cuttin, Goshen.

The date for the Carruthers Farm sale of registered Berkshires at Live Oak has been changed from August 16 to 23. Col. Ord L. Leachman will cry the sale.

J. M. Christen of Pacheco has sold a registered Hampshire boar to James Smith of Martinez, and another to Frank Amaro of Bay Point. Mr. Christen reports a heavy demand for registered Hampshire boars.

A moving picture film showing pig club work in Fresno county was shown to Farm Bureau directors at their June meeting. The film will be exhibited throughout the county in the near future.

Mrs. Seagram Anderson of Pleasanton, the well-known horsewoman, recently purchased a bred gilt and a young boar, both choice specimens of Berkshires, from the Castleview Ranch, Santa Rosa.

Thos. R. Carlyle of Sanger, has secured from the Castleview Ranch, Santa Rosa, a splendid yearling boar, sired by Mayfield Champion, the

\$1,150 Carruthers boar, and out of Rookwood Lady 100th, 1917 grand champion sow of America.

R. K. Walker of Winsor Ranch, Bonita, has sold one Great Model boar to R. N. Miller of Brawley for \$300, and 2 Great Model boars for \$250, each to the Southwest Cotton Co., of Phoenix, Ariz. Mr. Walker expects to exhibit at Sacramento, Los Angeles, Riverside and San Diego.

J. Francis O'Connor, Castleview Ranch, Santa Rosa, recently sold to Jenkins Bros. of Orleans, Indiana, the famous Berkshire sow, Grand Lady Mayhews 4th. This sow was grand champion at the California State Fair in 1916. Jenkins Bros. are featuring this California-bred sow in their great sale to be held August 9.

The Charnook Ranch of Hemet, Chas. R. Tyler, manager, breeders of registered Duroc swine, sold last week six market hogs 7 months old that averaged 213 pounds each, to Wilson & Co., of Los Angeles, for 20 cents per pound. This ranch markets about one carload a month that average from 210 to 230 pounds each at 7 months.

Chas. E. Dack of Fresno has sold a Poland-China service boar to Sylvia Wilde of Springville, a young boar to H. A. Johansen, Fresno, and another to Fred T. Matsuyama, Fresno. Mr. Dack reports that the March boar Jumbo's Model by Haag's Young Jumbo, which he purchased at the Lemoore Pig Club sale, is a very promising youngster and is coming along in fine shape.

Guilford, owners. Special Notice: Second Farm Sale. Shorthorns; Shropshires; Berkshires; Ponies. August 2, 1919.

Will Grunts Continue to Make Dollars?

(Written for Pacific Rural Press.)

Already twelve public sales of registered hogs are announced for the months of August, September and October, and several more are contemplated. Should our farmers attend these sales? Is it a good time for the beginner to get into the game, or for the established breeder to expand? Will it pay the raiser of grade market hogs to buy a high-class registered boar at the prevailing prices?

There are some persons today who openly express the opinion that the hog market has reached its zenith and is due for a terrific break. There are other well-posted men who declare that nothing can prevent \$25 hogs before September. Which ones are prophesying correctly?

It would seem as though the optimists are justified in their prediction. At least the future looks mighty rosy, for the important fact in connection with the present high prices is that they are not due to a hog shortage. Receipts have been heavy, yet the demand has been greater than the supply. Thos. E. Wilson, the Chicago packer, came back from Europe with the report that everywhere there was an enormous shortage of fats. He says that Argentine is selling beef to Europe cheaper than the United States can deliver it, but that America has no competition in the export of hog products, and he believes that Europe will need such quantities of hog products that she will be forced to buy heavily for us for some years.

John Clay, the noted commission man, says the same thing. In a recent interview he stated: "Cattle are bound to come down, but hogs are in

remarkable demand, and the prospects are for a continuation of high prices for porkers. The demand seems to be universal, and I regard the outlook for the hog business as most encouraging."

As Dean Hunt very clearly showed by charts at the annual meeting of the California Swine Breeders' Association, following previous wars it has taken years for staple foodstuffs to return to a normal standard of prices, and it is unreasonable to expect that after this most devastating of all wars the prices will quickly return to a pre-war basis.

Prices of breeding stock are regulated to a considerable extent by the market price of hogs, and while recklessness is never to be encouraged, it can safely be predicted that hogs bought at these fall sales, if properly cared for, will prove most profitable investments. Perhaps the time will come when there will be too many poor hogs in the country, but there will never be too many good ones. It may not be a good time to breed for quantity, but the fellow who breeds for quality will be playing a safe, sure game.

COWS IN THE HOLY LAND.

Cows in the land flowing with milk and honey are quite different from those in this country, where milk is beginning to flow in place of booze.

There are several species of cows in Palestine. The Damascus or Egyptian cow is excellent for milking, but is almost valueless for meat, and its resistance to disease is poor.

The Lebanon cow is not so good a milker, but brings a good price for meat and is better able to withstand disease. Golanite is not a good milk cow, but a paying investment for meat. The maics are good working animals and resist disease fairly well. The small local cow is good for neither milk nor meat nor work, but it withstands disease better than any of the others except the Golanite. The Bedawi is very much like the Golanite.

Because of the different characteristics possessed by these different types, the Jewish Agricultural College has been making experiments in

cross-breeding with some success. The area of pasture required for cows in that country is about three acres per head.

Lloyd & Tointon, Santa Rosa, think their Yorkshires have many points of superiority over other breeds and among them is prolificacy and quick gains. This is demonstrated particularly in the sow Nema 8th farrowing litters of 20 and 18 pigs in two consecutive litters. She raised 14 of the first litter herself. Quick gains are made with the pigs and they weigh close to 300 pounds in six months.

The Chester White Will Start You Right

Large litters, easy feeders, quick developers, low shrinkage in slaughter, premium carcasses—these are a few of the features of the Chester White, the profit-making hog.

Largest Herd On The Coast

Over 100 mammoth brood sows, headed by **HIGHLANDER**, the \$1,000 Grand Champion boar, whose sire and dam were both undefeated Grand Champions at three International shows. His pigs are corks—the kind you want.

ORDER NOW—AVOID DISAPPOINTMENT

The demand is keen. Get your order in early. We have a wonderful lot of tried sows, open and bred gilts, service boars and weaned pigs, representing the finest blood lines in America. Prices reasonable. Write us your wants.

Lakeport, Cal.

San Francisco Office, 601 Balboa Bldg.

POLAND CHINA INAUGURAL SALE

To prove that the best Poland-Chinas in the state are to be found in Fresno County, the newly formed Fresno County Poland-China Breeders' Association will start the ball a-rolling by holding an inaugural sale at which the tops of 17 of the leading herds in the county will be consigned.

50 Bred Sows, Bred Gilts, Open Gilts

There will be 30 bred sows, 17 bred gilts and 8 open gilts—wonderful brood sows and prospects, with great stretch, strong backs, heavy bone, well-sprung ribs, easy-feeding qualities—everything you look for in money-making hogs.

Study These Blood Lines

The animals offered are sired by such noted boars as President, Jumbo's Equal, King's Big Bone Leader, Young Jumbo and Model Fellow. In their pedigrees you will find the most noted blood lines of the breed. You need this blood in your herd to put you to the front.

Among the eastern bred boars to which the sows will be bred are Vaughn Jones, a descendant of Gerstale Jones; Hather's Big Bob, grandson of the world's champion; California Jumbo, a grandson of champion Giant Buster; and Blue Valley King, a son of King Big Bone.

Wednesday, August 20th FAIR GROUNDS, FRESNO

Come early and look over the stock. Free lunch at 11:30. Sale starts at 12:30. If you cannot attend, send mail bids to Thos. F. McConnell, field man for Pacific Rural Press, in care of the secretary. Field men will only bid on animals whose owners will ship on approval, thus assuring absolute satisfaction to the purchasers.

THE HAMPSHIRE HOG

The Hampshire has become America's most popular hog by sheer force of merit. The 1918 International Livestock Show was his last great record, winning grand championship over all other breeds, and selling for \$2.25 per hundred above his nearest competitor.

The Hampshire is the ideal hog for California conditions, as he is a natural foraging, green feed hog, and thrives well on our alfalfa and other succulent grasses, therefore requiring less grain than other breeds.

If you are looking for the greatest meat producer, investigate the Hampshire. Send for free information and literature about the progress of the breed and its adaptability to California conditions to

WALTER FOLK, Western Representative,
American Hampshire Record Association.

R. J. MERRILL & SON,

MORGAN HILL, CAL.

TIME TO SELECT THE EWES.

(Written for Pacific Rural Press.)

If the ewes that are to be retained for breeders have not already been selected, this should be done at once. In culling ewes from the flock two types should be carefully noticed—those that are extremely fat and those that are extremely thin.

The fat ones, especially those carrying an excessive bunch of fat about the rump, may be barren, their high condition probably being due to the fact that they have not been under the strain of bearing and nursing lambs.

On the other hand it must not be supposed that all thin ewes should be bred. If they have dull eyes, harsh fleeces, pale dry skins, a general run-down and unthrifty condition, and poor teeth due to old age, they should be disposed of at once.

If there is a contrary good condition, the thinness may be safely attributed to the fact that the ewes have been heavy milkers, and have raised pairs of strong, thrifty lambs. Of course such ewes should be retained.

As a final point in selection, a careful examination may reveal defective udders, and as such ewes cannot feed their lambs they should be culled. All ewes must pay their way, and if the flock owner will cull his flock annually he will have good individuals plus regular performance.

Flushing.

After the final make-up of the flock is determined, the ewes should have access to fresh pasture. Some kind of forage crop is desirable, and a little grain may be provided at this time. The idea is to have the ewes gain slightly in flesh a few weeks previous to and during the mating season. This practice is known among sheepmen as "flushing," and will insure an increased per cent of twin lambs.

Experiments conducted by the Animal Husbandry Division of the United States Department of Agriculture have shown that the extra trouble and feed required in flushing the ewes is repaid several times by the added number of lambs obtained. With ewes already in good condition the effect is less marked than with thinner stock. Young or dry ewes that are in high condition will not be benefited by flushing.

When ewes are gaining in condition at breeding time, most of them take the ram only once, so all of the lambs come at about the same time in the spring. This lessens the labor of the lambing season, as it is much better to care for a large number of sheep in a short space of time than to have the lambing strung out over a long period. Also it gives more uniform weights in lambs to be marketed.

The Ram.

The number of twin lambs is apparently governed more largely by the ewe than by the ram. It is important, however, to keep the ram in strong, vigorous condition, for if he is overtaxed and in low condition some ewes may fail to get in lamb. At the beginning of breeding the ram should be in good flesh, but should not have been overfed or kept too inactive. It is best if he can have grain feed and be separated from the flock for at least a few hours each day.

Breeding Hints.

Use one ram to every 35 to 50 ewes. Shear the ewes around the rear parts, and see that dung does not collect there.

Dip the ewes and the ram if ticks, lice or scab mites are present.

Keep a record of the time when the ram is turned in with the ewes and when taken away.

P. O. Box 177, Lancaster, Cal.

Follow the Crowd

All roads will lead to Santa Barbara Wednesday, August 6th. Never before has such interest been taken in a public sale. Progressive farmers from all over the State will be there. They have investigated the Hampshire and have found him to be "America's most popular hog." They have decided upon him as the farmer's best money-maker, and you will, too, if you want all the profit there is in hog raising.

California's First Hampshire Sale

For the first time in California you have the opportunity to secure animals of the best blood lines in America at your own prices. E. C. Stone, the leading Hampshire authority, says that Francis T. Underhill has given more thought to the foundation of his herd than any other man in Hampshire history; that Mr. Underhill has three of as good herd boars and as fine a lot of sows as he has ever seen; and that the stock to be offered at this sale is far superior to the average consignment at Middle West sales. It is the fruit of a \$25,000 investment in foundation animals alone, and represents the scientific mating of some of the greatest animals of the breed.

65 Bred Sows and Gilts

Four 3-year-old sows, 24 2-year-olds, 21 yearlings, 17 fall gilts. All guaranteed safe with pig; most of them carrying their own guarantees. Everything royally bred and from four great blood lines—Gen. Tipton, Lookout, Gen. Allen and Cherokee Lad. You can't beat this breeding.

The boars to which the sows are bred include Gen. Tipton's Masterpiece, the best son of the grand champion; Exalted Ruler, a Lookout boar by Exalted Lad, 1918, grand champion of Iowa; Draper Laddo, a Cherokee Lad boar; and Gen. Allen's Counterpart, by Gen. Allen, undefeated grand champion.

Wednesday, August 6th

Sale will be held at the Ortega Underhill Rancho, 4 miles east of Santa Barbara on the Coast Highway, near Montecito. Free transportation from Santa Barbara. E. C. Stone will be there. A State Hampshire Association will be organized at 10 o'clock in the morning. Free barbecue at noon. Sale starts at 1 o'clock. Be sure to attend. For catalog and full information address

Don't Let Horses Suffer from Mange

(Written for Pacific Rural Press.)

Mange seems to be about as prevalent among horses at present as the flu was among humans last winter, judging from the number of letters we are receiving from readers asking what to do for their horses that have an itching which causes them to rub the hair off in places; also the mane and tail.

This disease is the mange, a parasitic skin affection caused by mites which work their way into the skin, burrowing beneath the epidermis. It causes an intense, almost intolerable, irritation, and can easily be told by the uneasiness of the animal and its desire to rub against a post, fence, tree, side of stall, or building. The inflamed areas are small at first and generally are scattered over the regions of the rump, back and neck. After a time the areas come together and form large patches, and further spreading of the inflammation results from grooming, scratching and biting the skin. Scattered, elevated eruptions on the skin, from which the hair has been rubbed, are first noticed. Later the skin is thickened, smooth or wrinkled, and cracked or covered with sores.

The first thing to do is to separate the diseased animals from those not affected, and prevent its spreading by thoroughly disinfecting the stable, water trough, harnesses, etc. A sheep dip, such as Kreso, will do the trick. Then soften and remove the scabs by washing the horse with hot water and soapsuds, to which has been added a

little lysol, carbolic acid, or some insecticide, such as sheep dip. Rub dry and apply an ointment or liquid solution to the affected parts.

Several remedies are recommended. The one most commonly used is sulphur ointment, made of 2 ounces flowers of sulphur and 8 ounces pure hog's lard. Rub together by successive additions of the sulphur until a perfect mixture is obtained, and apply with friction daily for a few days. Then wash with soap and warm water, and apply again after drying the parts. Another ointment, used in the same way, is made of 10 parts potassium sulphide, 2 parts potassium carbonate, and 300 parts lard.

A liquid preparation which has given good results is 55 ounces fish oil, 4 ounces creolin, 1 ounce turpentine, 4 ounces oil cade, 1 dram oil peppermint. Another is 28 ounces cottonseed oil, 2 ounces creolin, 1 ounce balsam Peru, 2 drams oil pine needles. A simpler preparation is 1½ ounces sulphur, 1 ounce oil of tar, 2 ounces fish oil. All of these remedies are reliable, and will overcome the trouble if applied directly to the seat of the disease.

IT'S A SOURCE OF SATISFACTION

To know where to find the right kind of hogs when you want to buy.

KING JONES OVER

a son of the Great King Jones. Dam by Long King, out of a Big Bob sow. Weighs 600 lbs. at 14 mos. Stretchy, deep-bodied, well hammed and right up on his toes. He heads the best herd of strictly big-type sows in California.

PIG TALES.

C. E. Ellis of Tulare has sold a 3-months-old registered Duroc boar to three Riverdale breeders for \$150.

The pig that is a good grower is necessarily a good eater. This is one of the indexes that points to good results.

The healthy, vigorous pig is an equipped soldier that can defend himself against an attack of disease and repulse it.

Some of our very best young boars have been sacrificed by being crowded too much, and we often wonder if it pays, after all.

A sow that farrows five pigs or less on an average should be culled from the herd to increase its prolificacy and profit.

Stay right with the sow that produces a good big litter of good pigs and raises them; some of the best lookers are not the best pig raisers.

Tulare county ranchers are harvesting grasshoppers in sacks extended by poles from the sides of their automobiles, and are feeding the insects to their hogs.

Water is a necessity for hogs and they should be supplied with as much as they need. It is the cheapest ingredient that enters into the production of pork.

Duroc-Jersey breeders of Fresno county are urged to attend a meeting and banquet at the Hughes Hotel, 8 o'clock, August 2, to form a county Duroc breeders' association.

Don't turn a gilt out with a lot of old sows after raising her first litter. She will fare badly and get only cuffs from the sows. She should be well fed and cared for, so as to take on growth and develop. It requires good feeding for this and to put her in prime condition for her next litter.

R. K. Walker of the Winsor Ranch, Bonita, home of the Sweetwater Durocs, has just returned from a trip east in search of some additions to their herd. He announced the purchase of 5 outstanding sows as follows: A junior yearling by Great Pathfinder bred to Demonstrator, for which \$800 was paid; a granddaughter of Top Sensation bred to Great Orion Sensation, for \$700; a junior yearling daughter of Great Sensation bred to Pathfinder, for \$600; a daughter of Great Orion Sensation, for \$250, and a sow bred to Top Sensation, for \$300.

Calco-for healthier hogs

CALCO HOG TROUGHS are carefully designed to give just the sort of service a farmer wants—on his own farm, with his own hogs. They are not built on a theory, but from first hand knowledge of how hogs are raised.

Calco Hog Troughs are built of Armeo (guaranteed) Galvanized Iron and Cast Iron. No better material is obtainable on the American market. No crack or crevices in Calco hog trough for disease germs to lodge in—they are clean and sanitary throughout. No rough edges. Sides are braced by steel bars across top and by a strong roll in the galvanized iron. Calco Troughs give unusually long service, and help raise healthy hogs.

THERE'S A SIZE FOR YOUR OWN USE.

Stock No.	Diameter	Depth	Length	Weight	Price

"PROTEIN FOR PROFIT."

Poultry and Rabbits for Profit

Conducted by R. H. Whitten.

POULTRY OUTLOOK PROMISING.

Of all sad words of tongue or pen, The saddest are these: "I have no hen." Yes, the farmer who has no hens in these days is in a sad predicament. He is not getting the full profit that he should be making from his farm. The value of the eggs and poultry produced every year in the United States is now three-quarters of a billion dollars, which is more than that of all the gold, silver and diamonds taken from Mother Earth in a year throughout the entire world. But as great as the industry now is, the production of eggs and fowls must be even greater to meet the demands of increased population. At present there are about three hens to a person, and each hen lays an average of 80 to 100 eggs, or about 270 per year gross for each person. From this number there must be considerable reduction made for spoilage, loss, and eggs used for hatching and for manufacturing and baking purposes. The number left for table use is entirely inadequate.

Then again, we must consider the foreign demand. Before the war the United Kingdom imported 40 per cent of the eggs and 30 per cent of the poultry consumed. Of these quantities, one-half came from Russia, now swept bare of these products. Denmark and Holland, formerly exporters to Britain, are now shipping to Germany, while all of Central Europe has practically none of these products left. It is estimated that there are 187,000,000 fewer birds in Europe now than before the war.

Canada has been shipping heavily to Europe, but has exhausted its exportable surplus. The latest report of the Dominion Department of Agriculture reads: "Dealers say that no matter how much they offer for poultry their receipts do not increase. The country seems to be cleaned up."

So it is up to us to keep on increasing our flocks to meet the heavy demand, and we can be pretty sure that when Europe no longer needs our poultry supplies, if such a time ever comes, the increased population here at home and the greater consumption per capita will take care of them.

How about feed prices? Well, Europe will require 560,000,000 to 640,000,000 bushels of wheat this year, and countries besides the United States have an estimated exportable surplus of 651,807,000 bushels. Argentina can deliver wheat in Europe for \$1.95 per bushel, Australia for \$1.81 and Canada for \$2.54, while from the United States it will cost \$2.65. Consequently, unless we have to finance the buying and can insist upon the purchase of our own wheat, it looks as though Europe may not want so much of our 636,000,000 bushel surplus. Besides, wheat can be landed at Pacific Coast ports from Australia for \$1.86.

So, perhaps, feed prices will go down after awhile, and with them the prices of eggs and fowls will drop. But this need not mean any less profit to the poultryman, for it is pretty certain that the drop will be proportionate. The prices received for poultry products do not alone determine the profit. That is regulated by the proportion existing between the selling price and the cost of production, the latter determined largely by the cost of feeds. And with the prospect of lower feeding costs, but no decrease in demand for poultry products, the outlook certainly is promising.

Are you carrying as many hens as your ranch will accommodate? If not, better increase your flock.

TIMELY TOPICS.

The Poultry Show at the State Fair this year promises to be the biggest and best ever. E. F. Mitchell, who is in charge of the poultry department, has his heart in the work and is planning to put some big things across. Judges Hinds and Moore will place the ribbons, and they sure know birds. The premiums are the largest of any fair in the United States. Let's do our part to make it a huge success. Of course we'll be there.

A co-operative poultry association has been formed in the Imperial Valley by poultrymen representing the different farm centers of the Farm Bureau. It is planned to buy feed co-operatively; to hold a fall poultry show; and to have a "turkey day" in the fall when all the turkeys in that section can be sold on an open market.

A barley cover crop and chickens are rotated through six equal sized corrals into which the 5-acre peach orchard belonging to John Verda, of Burbank, is divided. Barley is sown in the corrals long enough ahead of the chickens to let it make good pasture for them. Mr. Verda has White Leghorns.

Condensing buttermilk to convert it into poultry feed is getting to be a prominent feature with large creameries. The latest one to embark in the business is the Western Creameries Company at Benicia, which is installing a plant representing an investment of \$25,000.

Beginners, and even experienced poultrymen, may profit from the latest methods of culling drones and increasing egg production, which may be explained during the six weeks' poultry short course at the University Farm, Davis, beginning September 29. Reliable and easily applied tests whereby slacker hens may be picked out and "flock boarders" removed will be taught.

The poultry industry is developing rapidly in Tulare County, undoubtedly due in a large measure to the excellent work of the Co-operative Poultry Association. This association is now doing a business of over \$1,000 per day. Eggs, table birds and baby chicks are sold for members, and the feed and supply department does a business of over \$9,000 per month.

Mrs. H. Ament, capon specialist of the Pacific Coast, has been invited by the directors to lecture and demonstrate on Capons and the Capon Industry at the State Fair. She will give information for practical and profitable raising of capons here on this coast; also will give instruction in this art and speak of the work already done in Southern California and the prices paid last season and demand in general. This will be an interesting feature in the poultry exhibition.

GIVE THE DOE A SUMMER REST.

Don't breed a doe to kindle during the summer months unless you live in a section of the State having a cool summer climate. She cannot rear a litter properly, even if she is lucky enough to have them born alive, which often is not the case. She is irritable, and the flies make life miserable for her. If she is not fed enough she cannot supply nourishment for her family; if fed as she should be for nursing she becomes too fat and can not stand the heat.

Even if the weather is not too hot, it is best to give the doe a rest, so that she can build up and gain strength for her next litter. Hold off on breeding long enough so that the litter will come after the hot spell is over, and you will be delighted with a litter of fine, healthy youngsters, showing how much good the rest period did for the mother. You may not get as many rabbits in a year, but the net result will be much better. Don't overwork the doe.

MAKE 'EM WORK FOR THEIR LIVING.

Fowls that roam at large can look after themselves well enough, but those in confinement must be made to work for their living. With this object in view plenty of litter should be put down in the runs. Anything that can be scratched about answers the purpose; straw, potato and bean stalks, pea hulls, chaff and screenings from the threshing machine, or any similar rubbish. The more litter there is, the longer the birds will work, keeping themselves in good condition all the year round. If litter of some sort cannot be supplied, the ground should be spaded regularly, and this not only will afford some opportunity for scratching, but will tend to keep the runs sweet. Baked ground saturated with excrement from the fowls is the cause of much disease, which could be avoided by the use of plenty of litter.

Poultry Breeders' Directory

CAPON SPECIALIST—Make capons of your useless cockerels. Learn how at the State Fair and add profit, fine meat and infertile eggs to the poultry industry. Mrs. H. Ament, 423 Kerckhoff Bldg., Los Angeles, Cal.

PEERLESS WHITE WYANDOTTES—Our ities and high egg production. 50 cockerels, 200-egg strain, bred for years for show quality pullets for sale. Trios and mated yards eggs for hatching. Catalogue free. J. W. Atkinson, Box 8, 130 Willard St., San Jose, California.

WHITE LEGHORNS are the most profitable breed of poultry; if you are in the business for profit, you will eventually have them; early broilers, early layers, early profits; we sell only White Leghorn baby chicks from heavy laying Hoganized hens; safe delivery of full count live chicks guaranteed; prices per 100. May and June delivery, \$12.50; July \$14. **THE PIONEER HATCHERY**, 408 Sixth St., Petaluma, Calif.

S. C. WHITE LEGHORN CHICKS—by the 100 or 1000 from A-1 Hoganized and Trapped stock. Won 1st, 2nd, and Special (Utility Class), Oakland and Modesto. Order early for Fall and Spring delivery. A. O. & P. M. Forster, 2918 Otis St., Berkeley, Cal.

GET BABY CHICKS NOW—Write for free booklet on fall chicks. See why they pay. Several varieties every week. Only good, strong youngsters shipped. Stubbs Poultry Ranch and Hatchery, Box 67, Palo Alto.

EGG BRED—Buff Brown, White Leghorns, Golden Campines, Dark Cornish. Winners wherever shown. Send for circular. Percy Ward, 3142 Ward St., Fruitvale, California.

FALL BABY CHICKS—Rocks, Reds, and White Leghorns; choice stock. Place your order in advance to insure prompt attention. Santa Clara Valley Hatchery, San Jose, Cal.

BARRED PLYMOUTH ROCKS—Nothing better in poultry. Prize-winners and wonderful layers. Choice stock for sale. Chas. H. Vadden, Box 3, Los Gatos, Calif.

BABY CHICKS—We have the large heavy-laying S. C. White Leghorns, severely culled last year. Send for prices. Tupman Poultry Farm, Ceres, California.

EASTMAN'S BRED TO LAY Hoganized and trapped Barred Plymouth Rocks. September chicks. Fairmead Poultry Farm, Fairmead, Calif.

FOR SALE—72 purebred S. C. Rhode Island Red pullets. April hatch; Eastern stock. Two dollars each. Mrs. Alice Jeter, Esparto, Cal.

V. C. HOWE, E. 14th St., near Knox Ave., San Leandro, Cal., breeder of Flemish Giants, American Blues, New Zealand Reds. Fancy and utility.

GOLDCROFT BUFF ORPINGTONS—Winners San Jose show. Choice stock for sale. Samuel Abrams, Los Altos, Calif.

CHICKENS, DUCKS, GESE, GUINEAS. Pea Fowl, Pigeons. Wm. A. French, 545 W. Park St., Stockton, California, Stamps.

BUFF ORPINGTONS, BUFF DUCKS, BOUBON RED TURKEYS—The Ferris Ranch Rt. 2, Box 144D, Pomona, California.

BRONZE TURKEYS—Albert M. Hart, Clements, Calif.

RABBITS.

FOR SALE—10 3/4 Gray Flemish does, 5 mos., wt. 10 lbs.; unbred; \$3.00 each. Four 3/4 Gray Flemish does; bred; 1 yr.; \$3.50 each. Three 3/4 Steel Flemish does; 1 bred, 2 with litter, \$3.50 each. Three 3/4 Steel Flemish bucks; 2, \$5.00 each; 1, \$4.00. Eleven New Zealand Reds; will kindle in August, except 4, with litters; \$3.00 each. One Belgian doe; bred; \$3.00. These are all young utility stock. \$100.00 buys the lot on ranch. J. A. Swedberg, R. F. D., No. 1, Box 47, Livermore, Cal. Ranch, 3 miles E. Livermore, on main Highway Stage Center.

RAISE RABBITS—Most profitable and popular small animal in America. Big demand. Clean, fascinating work. Send 10c for copy of leading rabbit magazine and our Rabbit Books, P. N. 5, Gilmore's Rabbit Farm, Santa Barbara, Calif.

FOR SALE—Thoroughbred doe rabbits, 10 mos. old; 3 Belgians; 3 Flemish Giants; 1 Himalaya (fur-bearing pedigree). Price, \$4 each. Will breed before sending if desired. Address P. O. Box 344, Healdsburg, Calif.

NEW ZEALAND REDS—First class utility does bred \$5.00 each. Young does, \$2.50 each. E. E. Caldwell, Broadmoor, San Leandro.

RAISE RABBITS FOR US—We supply the breeding stock. Send stamp for particulars. E. E. Gibson Co., Arcadia, Calif.

THE HOME CIRCLE

TOIL ACCEPTED.

"I ask not
When shall the day be done and rest
come on;
I pray not
That soon from me the "curse of toil"
be gone;
I seek not
A sluggard's couch with drowsy cur-
tains drawn.
But give me
Time to fight the battle out as best
I may;
And give me
Strength and place to labor still at
evening's gray;
Then let me
Rest as one who toiled a-field
through all the day."
—Unidentified.

PETER VAN AND THE TRAIL OF HOPE.

(Written for the Pacific Rural Press by Lucy M. Thompson.)

"It's the trail of hope all right," said Peter Van Neste, as he swung his car around from the driveway into the street. He drove slowly past the little green house, and he and Nora took one last, long look at the house that had been "home" to them for eight years.

"Yes, Peter, it's the trail of hope we're starting out on, but oh, Peter, what will we find at the end of the trail? Do you suppose we'll be sorry we started?"

"I don't know, I'm sure; but let's hope for the best. That's why I called it the trail of hope."

The decision of the Vans to start out on the trail of hope dated back to the day that Peter came home from the specialist's office with the verdict still ringing ominously in his ears: "You must get off the cares—and keep off—or you will lose your eyesight."

Now, Peter Van knew no other way of making a living. At the age of nineteen and fresh from school he had gone into the service. Two terms with the U. S. military forces he had served before Nora crossed his path and he assumed the responsibilities of a family man.

These responsibilities called for a steady job, and Peter had received no training for his life work. He groped aimlessly in the darkness that was the result of his inexperience and lack of training and at last found a place as motorman on the street cars of a large northern California city.

He was a good motorman, and had finally found himself on a day run with four dollars a day as pay. He considered himself very fortunate and it was then that he and Nora had bought the little green house and a nice big lot in the vicinity of the car barns.

Things went smoothly for a couple of years after that, and then Peter, whose eyes had been weakened on the target range while he was in the service and had given him no little trouble in his street-car work, was taken ill with the measles. This attack left his eyes in a serious condition, and it was three months before he was able to go back to work. Even then he could barely see a block away and he had many narrow escapes on the crowded city streets with his car. The reflection of the sun on the paved streets and on the glass in the front end of the car almost blinded him. At last his eyes got so bad that he went to an eye specialist and learned that his street-car days were over and that total blindness might result if he did not rest his eyes. The shock left him almost incapable of thought or action, and it was Mrs. Van who conceived the idea of selling their equity in the place—they had paid \$800 into it by this time—and, with the money and the second-hand car bought the year before, faring forth to seek Opportunity—and to rest Peter's tired eyes.

They sold the house furnishings, garden implements and chickens, bought a trailer, packed their clothing, bedding, and camping outfit in the trailer and in the back of the

machine, and set out on the trail of hope. They banked the \$800 received for the place, taking a bank book along with them for emergencies. Magazines, books, a rifle, ammunition, plenty of "chow," and a coast highway map were among the essentials taken with them.

Mrs. Van soon relieved Peter at the wheel, and Peter relaxed with a sigh of relief, gazing through his colored glasses on the green, tree-lined horizon.

It was April and the fruit trees were blooming, wild mustard and golden poppies lined the highway and the ever-present hills were fresh and green. They explored many little by-ways and fished from many streams, and Peter's rifle brought down an occasional rabbit or quail. The woods appealed to them, for Peter could take off his glasses where the shade was heavy and see things as they really were.

Down the coast they went, ever alert for indications of the end of the trail, for the trail would end for them when they found their future job.

So they wandered until in May they reached the border and turned east into the mountains. They made camp one night in the shadow of a great mountain, where a clear stream dashed down the slope on its way to the sea, and as they sat by their camp-fire after supper a motorcycle passed down the road at top speed and about midnight came back up the grade followed by an automobile. About daylight the two machines descended the grade again, and the man on the motorcycle stopped to borrow gasoline. He explained that he was a fire warden and that his nearest neighbor, a homesteader in a little valley beyond the mountain, had died late the day before, and that it was the coroner's machine that accompanied him with the dead man's body in a casket strapped across the tonneau.

Peter gave him a quart of gasoline and late that afternoon the man came back and stopped for a chat. It developed that the man who had died had taken up a claim in the little valley near the fire ranger's camp several years before, and that his mother, who was his only living relative, would want to sell the homestead as soon as it was probated. The forest ranger said the price would probably be somewhere near \$250. Peter decided to look at it, so he and Nora broke camp and spent the night with the ranger and his wife in the cozy two-room log cabin that was their home.

Next morning the four walked to the deserted homestead and climbed to the crest of the wooded spur, where the log house stood overlooking the valley. A little higher on the spur, behind the house, a spring gushed between two great rocks. The homesteader had made a cemented pool to collect the water, which was piped from the pool to the house and barn. The barn was of logs as was the chicken house, and the whole 160 acres had been fenced with a two-strand barbed-wire fence. Fifteen acres had been cleared, and 10 of it was in oats almost ready to cut, half an acre in potatoes, half an acre in Egyptian corn, two acres in field corn, a small plot in general garden, and nearly two acres lay plowed and harrowed but unplanted. There were several assorted fruit trees just coming into bearing in the yard. Two Jersey cows, a couple of yearling steers, and a suckling calf were lowing for water, and a team of horses whinnied for hay as the party neared the barn. There was a flock of chickens of mixed breed and a collie dog that begged for food, and the ranger drew a paper sack of corn-bread from his pocket, to the dog's delight.

"Nice place for somebody who likes the life," said the ranger, as they turned to go. "It's only 60 miles from San Diego and 8 miles from the nearest store and post office—it'll go cheap."

Peter turned and surveyed the place

again. "I guess we've reached the end of the trail, Nora, let's do down and get the car and camp here. Some one will have to take care of this stock and we have nothing else to do."

"Oh, Peter, I'm so glad you feel that way about it," Nora said; "I knew when we turned in at the gate that we had come to the end of the trail. We must stay and take care of the things—our own things."

They camped at the homestead that night and the next afternoon moved into the house, the ranger having obtained permission for them. Peter mowed the oats and stacked it in two great stacks near the barn, for it would be fed as hay.

The little valley lay 2,000 feet above sea level and was far enough back in the mountains that it got an occasional rain through the summer. For the same reason it sometimes revelled in the novelty of a snowstorm, and April and September frosts were not unknown.

(To be continued.)

HOW IT HAPPENED.

Teacher—Freddy, you must not laugh out loud like that in the school room.

Freddy—I didn't mean to do it. I was smiling, when all of a sudden the smile 'busted.

TOO MUCH TROUBLE.

It was in a country store back of Covington.

A one-gallus customer drifted in. "Gimme a nickel's worth of asafetida."

The clerk poured some asafetida in a bag and pushed it across the counter.

"Charge it," drawled the customer. "What's your name?" asked the clerk.

"Honeyfunkel."

"Take it," said the clerk. "I wouldn't write asafetida and Honeyfunkel for five cents."

LOCATED THE BLAME.

Margaret, aged 5, had been very rude to a little guest, and after the child had gone home Margaret's mother told her feelingly how grieved she was at her rudeness.

"I've tried so hard to make you a good child, Margaret; to teach you to be polite and kind to others, and yet, in spite of all my efforts, you are so rude and so naughty."

Margaret, deeply moved, looked

sadly at her mother and said: "What a failure you are, mother!"—Unidentified.

When you "save" 20 cents a pound on tea, you lose money on every cup. Fine tea is really cheaper than common tea.

And you miss the real tea-flavor, the comfort, the cheer, the invigoration, that every tea-drinker has a right to.

Get Schilling Tea and your rights as a tea-drinker.

There are four flavors of Schilling Tea—Japan, Ceylon, India, Oolong, English Breakfast. All one quality. In parchment-lined moisture-proof packages. At grocers everywhere.

STAIN REMOVERS AND HOW TO USE THEM.

Some stains may be removed by brushing or rubbing, others must be treated with special stain removers. Some are made by a combination of substances, and it may take a combination of methods to remove them.

Absorbents—These are the simplest and safest cleaning agents. Common ones are blotting paper, unglazed paper, talcum, French chalk, fuller's earth, starch, meals, and sawdust. They are used chiefly for grease stains, blood and ink stains, and freshly spilled liquids.

To Use Absorbents—Cover grease spots with a powdered absorber, let stand several hours, then brush. Or lay the material on white blotting or unglazed paper and cover with powder or more paper; apply a warm iron; repeat, using fresh power or paper until the stain is entirely removed. Cover dry blood and ink stains with starch paste; when the paste dries and discolors, brush off and repeat until the stain disappears. Cover freshly spilled liquids with powder, meal, or bits of blotting paper; this prevents the liquid from

spreading and sinking into the material.

Solvents—These dissolve grease, sugar, and some other substances that hold stains in fabrics. The most common solvent is water; others are alcohol, benzine, carbon tetrachloride, chloroform, ether, gasoline, kerosene and turpentine.

To Use Water—Soak washable goods in cold water and wash with cold or tepid water and white soap. Use hot water in the same way or by spreading the stained goods over a bowl and pouring boiling water from a height. Caution: Hot water sets some stains, such as blood, meat juice, milk and egg. Place non-washable materials over a pad of white cloth or absorbent paper. Sponge, using very little water at a time. Change the pad as it becomes soiled or wet. Rub gently till dry. Caution: Water should not be used on some materials because it spots them.

To Use Other Solvents—Place the stained goods over a pad of cloth or paper and apply the solvent, using a glass rod or a stick with a rounded end. Work from the edge of the stain toward the center. Surrounding the spot with powder keeps the liquid from spreading and helps to prevent a ring forming. Change the pad as it becomes soiled or wet.

Neutralizers—If the stain is made by an acid, treat it with an alkaline substance. If it is made by an alkali, weak acid may restore the color. Acids and alkalis have an opposite effect and are said to "neutralize" each other.

To Use Neutralizers—Common acid stains are made by sour fruit juices and vinegar. Neutralize these by using a solution made of about 1/4 teaspoon ammonia, baking soda, or borax to 1 cup water. Spread the stained material over a pad and sponge it; or stretch it over a bowl of water and apply the solution, a drop at a time; a medicine dropper is convenient. Rinse with clear water. Alkaline stains are usually caused by ammonia, strong soda, potash, or strong soap. Neutralize these with vinegar, lemon juice, or weak hydrochloric or oxalic acid. Work as for acid stains. Rinse with clear water. Caution: Never use hydrochloric acid on silk.

ARIZONA WOMEN CAN MUCH FRUIT.

The women of Snowflake, Navajo county, Arizona, with a population of a few hundred persons, co-operatively canned 13,049 quarts of fruits and jellies for home use in one year.

They own co-operatively three pressure cooker canners which they pass from house to house. In 1918, they canned 13,049 quarts of fruits and jellies and dried 1,745 pounds of fruits and vegetables.

Snowflake is in an isolated section of Navajo county, approximately sixty miles from a railway. Such a plan would be advantageous in many parts of California and deserves notice.

Baptist hens in Ohio did their denominational duty toward the \$6,000,000 Victory Campaign during Golden Egg Week, when they laid 26,388 eggs toward the state quota of \$425,000, according to a statement by the Rev. Charles A. McAlpine of the National Committee of Northern Baptist Laymen, which is the organization in charge of the drive.

PIGEON TO RECEIVE THE D. S. C.

At least one of the one thousand pigeons that have returned from France after helping win the war will be decorated for distinguished service. "Cher Ami," the pigeon that carried the message to General Pershing's headquarters, announcing the victory of the Yankees in the Argonne, will be given such honor. Cher Ami is the feathered hero that flew thirty-seven miles after its left leg had been torn away by an enemy

bullet, and delivered intact the despatch with which it had been entrusted. He is also one of the pigeons that carried dispatches announcing the plight of Lieutenant-Colonel Whittlesey and his lost battalion, to which aid was immediately sent.

For these heroic deeds Cher Ami has been recommended by General Pershing for the D. S. C. The pigeon will from now on have the best of quarters in Washington, a plentiful ration, and all proper care.

When You Buy a Piano it Pays to Buy a Good One

When you buy a piano you intend it to last a life time. Therefore special care should be used in making a selection.

You should not be guided by cheap prices or special inducements. Pianos, like everything else, are priced according to their intrinsic worth. If you do not possess expert knowledge of piano making you must rely greatly on the Piano Dealer. Take greater care in selecting the Dealer than the Piano. It is certainly to your interest to go to a dealer who has the reputation of carrying only pianos of merit and true musical worth, who is known to price his pianos consistently, and who has only one price for everybody.

We carry a number of well known makes, each the very best in their grade. Prices of new pianos range from \$400 upward; good "used" pianos from \$200 upward. If desired, we arrange convenient terms of payment.

We invite you to call at any of our stores—or write us asking for illustrated catalogs and prices.

We are dealers in Steinway and other Pianos, Duo Art and Pianola Pianos, Aeolian Player Pianos, Player Rolls, etc.

Market Comment

Half-Acre Apricots \$826.

Thirteen tons of apricots sold for \$826 in Modesto. George Roberts grew them on half an acre. This is a record for this section of the State.

75-Cent Cotton Predicted.

Predictions have been made in Chicago that cotton will go to 75 cents a pound within a year. Merchants blame the manufacturers for the high prices of finished products.

A Plum Record.

Plums from 70 trees on less than an acre, yielded 15 tons to C. G. Kline of Yuba City. The fruit, Washington plus, brought \$80 a ton or \$1,200 for the crop. Sutter county claims this is a record.

Delta Barley Bringing \$3.

Barley on the levees of the Delta lands is bringing \$3 a hundred. Yields of from fifty to sixty sacks are returning \$165 to \$198 an acre. Cash rent of \$40 an acre has been refused by some owners.

Peaches Climbing.

Peaches have maintained a high level all season, but seem to be climbing. Large lug boxes of good fancy ripe stock brought \$2.75 this week. Baskets sold for \$1.50 and small boxes of wrapped fruit brought \$1.25.

Rice Yields and Prices Good.

Rice in Sutter and Yuba counties is fine, due to ideal weather. The grade is good and growers expect a price around \$6 per cental. The crop is large. Dun's report estimates a 40 per cent increase in the rice yield this year.

Shorthorn Bull, \$50,000.

The world's record price was paid at the Royal Agricultural Show in London, Eng., recently, when a Shorthorn bull sold for the equivalent of \$50,000. The bull was bred by the Edgemoor Shorthorn Company. All cattle are bringing high prices abroad.

Wine Grape Growers Smiling.

Wine grapes in Sonoma Valley will go at \$60 a ton this fall—if the wine-makers are permitted to make wine. The grape crop all over Sonoma county is the finest ever known, and a failure to harvest the crop would mean a loss of several million dollars.

Watsonville Apples Up.

Eastern buyers have secured a lot of new crop Newtown apples at \$1.85 a box, Watsonville delivery. The Apple Growers Association there advanced the price 15 cents per box, owing to liberal contract purchases and more buying orders coming in from the East.

Prune Production and Prices.

Further advances were recorded in the dried prune market last week in spite of the fact that the California production will be about 150 per cent larger than the merchantable crop last year. Sales of 40s at 18c and 50s at 15c were made during the week. A car of 40-90s at an advance of 4c over the previous week's quotations was sold.

Tomatoes Profitable at Knightsen.

From sixteen and a half acres of ground 300 tons of tomatoes are to be taken. The crop will be packed at Oakley and has been contracted for at \$20 a ton. The value of the crop is \$6,000; the yield at the rate of \$375 an acre. The crop was set out as an experiment, the result being so good that a new industry is expected to develop in the section.

Hops Advance Despite Prohibition.

Hop prices continue to rise, selling in the open market now around 55c. Dealers expect the price to go near 75c in the winter and are advising hop growers to hold their stocks. The market is steady and prohibition seems to have no effect. The harvest will begin in the middle of August and end the last of September. Eastern brewers are buying all the hops available and growers are making arrangements for a few years. Contracts let for the next two years have prices ranging around 40c per lb. In the Puyallup Valley, Washington, hops are quoted now from 50 to 55c a pound and expectations are set at 65c.

THE MARKET REPORTS

Figures Given Are Independent and Reliable.
Prices Quoted as Paid to Producers.

SAN FRANCISCO.

San Francisco, July 30, 1919.

WHEAT.

There is little feature to the local wheat market, its strength being based principally upon the firmness of the eastern markets.

Per bushel—	
No. 1 hard	\$2.20
No. 2	2.17
No. 3	2.13

California	\$3.67 1/2 @ 3.75
Early Baart	\$4.15 @ 4.20

BARLEY.

Barley continues strong and higher prices are quoted for the old crop. On the exchange futures sell higher than the spot grain. May barley is quoted at \$3.45 to \$3.47 1/2 and December sold as high as \$3.40. Feed

Feed \$3.20 @ 3.25

Shipping \$3.25 @ 3.35

OATS.

The quotations on oats were moved up this week in sympathy with the advancing prices of barley. Some red feed sold as high as \$3.25.

Red feed, per ct.	\$3.00 @ 3.25
Red for seed	Nominal
Black for seed	Nominal
Re-cleaned Red or Black for seed	Nominal

CORN.

While the prices of corn are not changed there is a strong undercurrent to the market, which indicates higher prices if the strength of the other grains continues to be manifested. California

California \$3.30 @ 3.50

Egyptian, choice Nominal

Milo Nominal

HAY.

Receipts of hay for the past week were 2770 tons compared with 1830 tons the previous week. The receipts are now commencing to show an increase. The bulk of the receipts are coming in by boat and rail receipts in this market are below the usual amount at this season. The demand is fairly active and prices have been easily maintained. Owing to the reported shortage of water in some districts and of grasshopper pests in others, alfalfa has been held firm on a higher range of prices than heretofore. Trade in the country districts has been better than for some time and considerable hay has been moved in this direction.

No. 1 Wheat, per ton	\$15.00 @ 17.00
No. 2 Wheat, per ton	12.00 @ 14.00
Choice Tame Oat, per ton	15.00 @ 17.00

Stock Hay, per ton	9.00 @ 11.00
Barley Straw, per bale	.50 @ .80

FEEDSTUFFS.

The demand for feedstuffs has been quite active during the past week and there has been some difficulty in getting enough produce to satisfy all demands promptly. As a consequence there has been a strong upward tendency in the market. Millrun was bid up \$2 by the dealers in the effort to get enough to satisfy their customers.

Bran	Not being marketed
Shorts	Not being marketed
Cracked corn	\$78.00 @ 80.00
Roller barley	66.00 @ 67.00

Roller oats	64.00 @ 65.00

Cocunut meal	48.00
Oil cake meal	71.00 @ 72.00
Milkmix	58.00 @ 60.00
Millrun	48.00 @ 47.00

POTATOES, ONIONS, ETC.

Onions are quiet with a downward tendency. There are practically no more reds left, while the supply of browns is becoming plentiful. Potatoes showed some strength this week on a demand from outside sources. Prices, however, were not changed. Corn continues to go down in price, while an oversupply of tomatoes is rapidly running down the price of that vegetable. It is believed that the next week will see even lower prices on tomatoes. The green vegetables as a whole show little change.

String beans	3 @ 4c

BEANS.

The bean market is stronger than it has been for a long time. The acreage of new beans has been cut to such an extent that it is realized that a shortage may develop. The high price of rice has also turned the attention of the Japanese to beans, and it is reported that they are buying more freely than ever before. The advances in prices were all along the line this week, excepting Teparies and Garbanzos. Limas are nearly exhausted and the price was advanced from \$9 to \$12. Bayos, per ct.

Blackeyes \$5.25 @ 5.50

Cranberry beans \$6.00 @ 6.25

Limas (south, re-cleaned) \$12.00

Pinks \$6.40 @ 6.60

Mexican Reds \$5.00 @ 5.25

Special Deciduous Market Report

(Written for Pacific Rural Press by J. L. Nagle.)

Sacramento, Cal., July 28, 1919.

Prices in all markets on Bartlett Pears during the last week ruled lower, due to increased offerings. Despite the heavier supplies, however, there was a good demand. Receipts of Bartletts will be still heavier this coming week and we look for still lower markets, with an upward tendency the latter part of the week and a firm tone in all markets through the balance of the season. These conditions are usual. Shipments of Bartletts from the Sacramento River will continue for the next ten days, though the movement will be considerably lighter from now on.

There is strong demand for peaches on account of the offerings of stock of this variety from Southern States arriving in unsound condition. It is reported that brown rot has destroyed about 50 per cent of the New Jersey crop and has seriously affected the peaches from Southern states. The movement of peaches from Georgia and Texas has practically discontinued. Shipments from Oklahoma are light but the crop of Arkansas Elbertas has just begun to move. A great deal depends upon the condition of this fruit upon arrival as to how the Eastern markets will affect our California stock. The demand for California Elbertas in the Middle West markets should be very active and we anticipate being able to maintain satisfactory prices throughout the entire harvest.

The tonnage of Lower San Joaquin Valley Elbertas has been considerably cut down on account of the excessive heat, but the crop in the Northern San Joaquin Valley and Placer county is normal. Shipments will continue for three weeks.

It has been customary in former years for the trade to store Georgia and Eastern state peaches, but on account of the lack of keep-

ing quality of the stock this season, practically no cars have been put in storage, which should give a freer market to the late varieties of California peaches.

Government figures for June for Ohio, Michigan and New York peaches estimates the tonnage at 50 per cent.

Plum shipments from California are light, with only a few varieties yet to be shipped. The demand is very firm and will remain so for the balance of the season.

Thompson Seedless and Early Malagas are moving at considerably higher prices than last season. The present market will be somewhat lower under increased offerings, but shipments are well regulated and if the stock arrives in good condition, there is no question but what the entire crop can be moved to good advantage.

Averages for the week:
NEW YORK—Bartlett Pears, \$3.93; Malaga Grapes, \$4.02; Thompson Seedless, \$3.37; St. John Peaches, 99c; Hales, 70c; Crawford, \$1.36; Tuscan, \$2.71; Wickson Plums, \$2.30; Tragedy, \$1.84; Burbank, \$1.78; Duane, \$1.67; American Blue, \$1.74; Climax Plums, \$1.51; Gaviota, \$2.26; Santa Rosa, \$1.86; Diamond, \$2.04.

BOSTON—Bartlett Pears, \$3.88; Malaga Grapes, \$3.80; Thompson Seedless, \$2.62; Decker Peaches, \$1.75; Hales, 91c; St. John's, \$1.15; Wickson Plums, \$2.98; Tragedy, \$2.18; Diamond, \$1.96; Burbank, \$1.93; California Blue, \$1.96; Climax, \$1.61; Gaviota, \$3.16; Maynard, \$1.35; Santa Rosa, \$2.57.

CHICAGO—Bartlett Pears, \$3.64; Malaga Grapes, \$3.16; Thompson Seedless, \$2.61; Crawford Peaches, \$1.55; St. John's, \$1.83; Diamond Plums, \$2.11; Tragedy, \$2.06; Burbank, \$2.17; Wickson, \$2.27; Gaviota, \$2.70; Duane, \$1.85; Santa Rosa, \$2.20; Formosa, \$2.50.

BUTTER.

Butter has shown little fluctuation during the past week. It has been steady throughout July and shows but a half-cent change in range from that of June.

Th.	Fri.	Sat.	M.	Tu.	Wed.
Extras	54 1/2	55	55 1/2	56 1/2	55
Prime firsts	53 1/2	53 1/2	54	54	54
Firsts	51 1/2	51 1/2	51 1/2	51 1/2	51 1/2

EGGS.

Eggs have shown greater changes in prices than butter during the week. They have steadily advanced in price, notwithstanding heavy receipts in this market and in the eastern markets. The movement to storage has not been great and on several days more eggs were taken out of storage than were put in. The amount on hand in the ice houses is almost identical with that of a year ago at this time, although the prices at which eggs went into storage this year were considerably above the figures of a year ago.

Th.	Fri.	Sat.	Mon.	Tu.	Wed.
Extras	51 1/2	52 1/2	52 1/2	53	54 1/2
Firsts	49 1/2	48 1/2	48 1/2	49	52
Ex. pullets	44	44	44	45	46 1/2

CHEESE.

California cheese showed considerable strength this week under fair demand. The Oregon product was weaker, although quotations remain unchanged. California flats were in special demand.

do, Firsts	29c
California T. A.	36c
California Y. A.	32c
Oregon Triplets	32 1/2c
Monterey cheese	23 @ 27c

FRESH FRUITS.

There is no longer a demand for the ice-house apples of last season as the local market broadens. Gravensteins are not yet in prime condition for home consumption. The bulk of the arrivals of this apple is now being shipped away.

Apricots are almost exclusively in bulk now and they sell at from 5 1/2 to 6 cents a pound, about what the canners are paying for them. Thompsons Seedless grapes are coming in in quantity, and sell from 75c to \$2 a box. The melon market is weaker. The Honey Dew melon at \$1.50 to \$2 is attracting attention among the buyers, and this affects the demand for cantaloupes.

Apples, New Red Astrakhan, boxes	\$1.50 @ 2.00
do, Gravensteins	\$2.25 @ 3.00
Peaches	75c @ 1.05
Apricots, bulk, lb.	.5 1/2 @ 6c

Figs	.75c @ 1.00
Grapes, Seedless	.75c @ 1.00
Strawberries, chest	\$1.00 @ 1.40
Loganberries	\$1.00 @ 1.40
Raspberries	\$1.00 @ 1.40
Blackberries	\$1.00 @ 1.40
Currents, chest	None
Cherries, Black, bulk	None
Cantaloupe, Standards	\$1.25 @ 2.00
do, Ponies	\$1.00 @ 1.25
do, flats	.75 @ 90c
do, Honey Dew	\$1.50 @ 2.00
Watermelon, lb.	1 1/4 @ 1 1/2c

CITRUS FRUITS.

The citrus market is strong with fancy lemons selling at \$8. Valencia are no higher for the best, but the cheaper grades have disappeared and \$4 is the lowest price quoted for really good oranges. Grapefruit is also showing strength and sells fifty cents higher than last week.

Oranges, Valencia	\$4.00 @ 5.25
Lemons, fancy	\$7.00 @ 8.00
do, choice	6.00 @ 7.00
do, standard	5.00 @ 6.00
Lemonettes	4.00 @ 5.00
Grapefruit	4.00 @ 4.75

DRIED FRUITS.

The dried fruit market continues to show great strength as the season advances. While the dealers declare that prices are beyond reason they continue to buy and from time to time to bid against one another for choice stock.

Apples	20 @ 20 1/2c
Pears	20 @ 21 1/2c
Peaches	17 1/2 @ 19c
Apricots	23 @ 25c
Plums	13 @ 15c
Figs, Adriatic	14 @ 20c
do, Calymna	16 @ 23c

RICE.

The 1919 crop will undoubtedly exceed all early expectations, but there is no tendency to look toward lower prices. On the contrary, the trade seems a unit in predicting that prices will mount above the present market.

HONEY.

The reports of extremely hot weather throughout the San Joaquin Valley seems to end the hope that honey might go to a lower level. It is said that the bees in many locations have stopped working on account of the heat and that the crop will not be nearly so large as anticipated a short time ago.

Water-white orange blossom	18c
White to water-white sage (subject to production)	18c
Light Amber Mountain (Sage-Buckwheat)	13c
Light Amber Alfalfa	11 @ 13c

WOOL.

The wool market displays a healthy undertone, and there is an especially strong demand for the coarser grades.

Humboldt	60 @ 62 1/2c
Mendocino	55 @ 58c
Sacramento	40 @ 45c
San Joaquin	35 @ 37 1/2c

HIDES.

The hide market is going up and higher prices are considered certain. Some tanneries are forced into the market for supplies. No. 1 wet salt kip, 15 to 30 lbs, 50c; No. 2, do, 47c; No. 1 wet salt calf, trimmed, 75c; do, untrimmed, 75c; No. 2 calf, 2c lb. less. Wet salted horse hides—No. 1 large, skinned to hoof, \$10 @ 13; do, medium, \$7 @ 9; do, small, \$1 @ 3.50; No. 1 colts, 60c @ \$1.

MISCELLANEOUS.

FIRST-CLASS ALL-ROUND DAIRYMAN, married, no bad habits, good hand or mechanical milker, used to modern machinery, wants charge small place, or would consider profit-sharing basis. Give particulars first letter. Box 1600, Pacific Rural Press.

WANTED—ESTATE SUPERINTENDENT—Capable of managing residential estate. Should have knowledge of floriculture, horticulture, etc. Experience in care of chickens, cows, etc. Must have experience employing and managing men and practical experience in all estate matters. Apply by letter only. State experience, nationality, salary wanted and address. Box 1620, Pacific Rural Press.

RANCH MANAGER—Of executive ability and energy, desires charge of stock or alfalfa ranch. Experienced with stock and general farming; competent to handle cattle or hogs; thoroughly posted on range conditions, feeds, feeding, irrigation, dry farming and dairying. Highest reference. Box 1610, Pacific Rural Press.

WANTED—A tenant for dairy ranch, milking 20 cows, 20 acres in alfalfa, 20 acres in fruit trees, all under irrigation, silo, good barn, good house, long lease, liberal terms. References required. Address, Jones & Sons, R. F. D., No. 1, Box 33, Perkins, Calif.

REMANUFACTURED PIPE.

All sizes standard pipe and wrought iron screw casing. All kinds of fittings. Guaranteed good as new. Write for prices. Wells-Heaume Pipe Works, 160 Eleventh street, San Francisco.

FOR SALE—Ventura Bean Thresher, Junior No. 2. Equipped with ten-horse-power gas engine. New last season. Used only very short time. Best of condition. One thousand dollars takes it. Phillips & Johnson, Box 93, Mendota, Calif.

ALL SIZES OF PIPE and screw casing, both new and second-hand, dipped and undipped. Guaranteed. Prices right. Shafter Pipe Works, 304 Howard St., San Francisco.

Monro Perfect Silo

Ends your silo troubles. Stays round. Stays tight—wet or dry. Easy to build. Absolutely smooth inside. No hoops or bolts to need adjusting or rust away. No upkeep cost. Easy to take apart and remove. Quickly and cheaply enlarged or reduced.

Every Bump a Collision!

Every Bump is a Little Collision in Itself

COMBINE the bumps your Ford is compelled to withstand in a year, or even six months, and you would have a collision that would tear it to pieces.

Just because you can't notice the injury day by day is no sign it is not taking place.

Prevent the effects of the bumps from reaching the vital parts of your Ford Car or Ford One Ton Truck and you will find a saving of more than one-third in the up-keep and tire expense. You also will find that at least fifty per cent has been added to its life and resale value.

Hassler Shock Absorbers afford this protection for every Ford. They absorb the "little collisions" before they get a chance to do their damage.

Hasslers are proving their worth on more than a million Ford Cars today. Look and you will see that one in every three Fords is now equipped with the Patented Hassler Shock Absorber. And while the saving is remarkable, yet a large percentage of Hassler owners purchased them because of their easy riding qualities. Any Hassler owner will tell you that the additional comfort alone is worth more than the cost of Hasslers.

We might also mention that gasoline mileage is increased; that steering is made easier, adding to the safety of the car; and that greater speed is made possible, giving more practical value to the car.

Hassler Shock Absorbers can be applied in a few minutes. They do not require marring of the Ford. There are two types; one for the Ford Passenger Car and another for the Ford One-Ton Truck.

10-DAY TRIAL OFFER

Find out for yourself what Hasslers mean. We do not ask you to risk your money. The Hassler dealer in your vicinity will put them on—let you use them for ten days—and if you are not pleased they will be taken off and your money refunded in full. Write for descriptive folder—name of the nearest dealer and trial order blank.

The Hassler Guarantee: "Absolute Satisfaction or Your Money Back"

ROBERT H. HASSLER, Inc., 1194 Naomi St., Indianapolis, Ind.

Canadian Factory: Hamilton, Ontario

A Standardized Quality Product—Worth the Price

Shock Absorbers

THE conical springs set at the angle shown prevent sidesway and allow for the most resilient downward action. The springs compress on either upward or downward movements—do not stretch out of shape—do not allow up-throws. Hasslers last as long as the Ford and make it last.

Superior New Drought-Resistant Barley.

Written for Pacific Rural Press by Professor G. W. Hendry, University Farm, Davis.

MARIOUT BARLEY has been grown in the Sahara Desert of northern Africa since Roman times, and has thrived and produced well in the dry, arid climate of that region. It was introduced into California in 1904 through the State Experiment Station, and has been under continuous observation since that time. In 1912 seed was given to B. C. French, near Davis, for a test under ranch conditions, and in this it was at once successful and sustained its previous record at the University Farm by yielding several sacks per acre in excess of common barley. The following year Mr. Theo. Oeste, an extensive Yolo County barley grower, tried it, and has continued to grow it in increasingly large quantities to the present time. By degrees other Yolo County ranchers have adopted it, and all have spoken strongly in its praise. To date it has excited more interest among local growers than any other cereal previously introduced by the Experiment Station, and each year is becoming more firmly established in the opinion of all as a valuable and important addition to the productive resources of the county. In 1917 there were about 300 acres of Mariout in California; in 1918 there were 700; in 1919, 3,000 acres and the forecast for 1920 is 10,000 acres. Yolo County is the center for its production and all of it is grown within a radius of 20 miles.

It has shown the greatest advantage over common barley in dry years when it has yielded 5 to 15 sacks more per acre. In the dry spring season of 1919, for example, it yielded 39.5 sacks per acre at the University Farm, compared to 19.0 sacks per acre for the common variety under similar conditions. In a test at the U. S. Plant Introduction Garden this season (1919) Mariout yielded 29.3 sacks per acre as compared to 18.5 sacks per acre for common barley.

Mariout Best for Spring Planting.

Mariout may be spring sown (February and March) with much better prospects for success than common barley. On the flood lands of the Yolo Basin it has been planted as late as April 20th, and ripened 80 days later, yielding far in excess of common barley.

An instance illustrating its peculiar adaptation to spring planting occurred on the higher lands of Yolo County in 1919, where as a result of deficient spring rains, spring planted Mariout produced well, when the common variety handled in the same way failed entirely. Some of these fields of Mariout planted in March received no rain whatever subsequent to

COMMON BARLEY has been grown in California since the days of the Spanish Missions, and but little thought given to the question as to whether it was the best variety to grow. After nine years of critical experiments at and near the University Farm, Davis, California, it has been definitely concluded that the variety "Mariout" is a more productive and remunerative variety than common barley in the interior districts of California and that it regularly outyields common barley by 5 to 15 sacks per acre on dry soils and in dry years. It can be harvested two weeks earlier than common barley.

MARIOUT AND COMMON BARLEY.

The "rachilla" shown between ends of dotted lines is bristly in Mariout, the drought-resistant barley, which has been grown in Yolo county many years. This variety produces shorter straw than the common barley, but stools more and produces thicker, stouter heads, which do not shatter so badly in the north winds.

planting and yielded 10 to 15 sacks of grain per acre. In many of the Mariout fields, a sprinkling stand of common barley appeared simultaneously with the Mariout, but on account of the severe drought, only the Mariout produced seed.

A signal instance illustrating the special suitability of Mariout for spring sowing occurred in 1912. In that year the total seasonal rainfall amounted to only 9.46 inches and it was the most severe drought recorded in recent years. In a test of Mariout and common barley that year, in which the two varieties were sown February 2nd, under strictly comparable conditions, Mariout yielded 47.57 sacks per acre and common barley 20.7 sacks per acre.

In a series of fall planting tests at the University Farm extending over nine years, Mariout has averaged 4 sacks per acre above common barley. At the U. S. D. A. dry farm, field station at Moro, Oregon, with extremely low average annual rainfall of 11.6 inches; Mariout in competition with 28 other barleys, has maintained the highest average yield during an eight-year test; has outyielded the common barley in seven out of eight years that it has been grown; and has, on an average, produced five sacks per acre more than common barley.

Mariout Needs Less Rain.

Not the least merit of Mariout is its more economical use of soil moisture. An exact series of tests at Davis in 1919 showed that Mariout stubble land contained $1\frac{1}{2}$ inches more of rain in the "surface three feet" than an adjacent piece of common barley stubble. Based upon the moisture content of an intervening fallow strip, Mariout used 1.68 inches of soil moisture to complete its growth, and common barley used 2.96 inches. This wide difference in moisture draft must be accounted

the most significant reason for the well-known drought resistance of the variety, and may well account for the greater success of the variety on dry soils and in dry seasons.

Mariout Whips Out Less Than Common Barley.

Heavy losses are annually sustained by barley growers through the whipping out and shattering of the ripe grain during strong north winds. Fully 25 per cent of the barley crop of the Sacramento Valley was lost in this way on May 30, 31, and June 1, 1919. It has been observed by Yolo County farmers that Mariout suffers less wind damage than common barley. Mariout also ripens about two weeks in advance of common barley, and is well adapted to those lands subject to overflow during harvest season.

EDITORIAL.

A CASE OF COW-BUOYANCY!

Some of us who delight to pass the late afternoon (after the amended clock has set us free from an eight-hour day) in the cool, dim silence of the movie-palaces, so promotive of restful, recreative meditation—have doubtless reached the conclusion that the cow-boys live no longer except as they meet the demand for film-heroes. And this conviction is deepened by what we read in the daily paper about up-to-date range operations to such an extent that in our mind's eye we see the sportive steers pursued by an aeroplane, branded by dropping the range-owners private bomb, or, later in their careers, roped from above, swiftly carried aloft to the knives of aerial butchers alighting on them from parachutes, who scatter their surplus contents over the landscape while the precious parts neatly fall upon trains of trucks which are pursuing their ways along concrete highways, scheduled to deliver carcasses still warm upon the blocks of metropolitan distributors! With such a dream, which the silent darkness of the late afternoon is fitted to create in the mind, the cow-boy of the past becomes, of course, only a property of the film-makers! And this conception of the apotheosis of the cow-boy is heightened also by what we read of the late Secretary of the Treasury donning the idealized cow-boy garb and riding with Douglas Fairbanks through the cactus-pylons into the cow-boy's paradise! They are really fine, these late afternoon dreams in cool, filmy silence! What less than Providence has given us this to fill the vacant cock-tail hour! How grandly comes this restful, recreative, stimulative silence of the movies to make good to mankind the clink and sparkle, amid bedimmed, herbaceous fragrance, of which prohibitive legislation has robbed the race!

EMERGENCY SHATTERS THE DREAM.

But the dream breaks! Out upon the silent shadows of the film of moving affairs comes this placard:

LIVERMORE, July 28.—The old-time cowboy is not a thing of the past, according to J. J. Moy and Rod Fallon, two veterans of the range, who have just returned from a ranch in the Berryessa Valley, where they roped and branded 1,000 head of cattle in three days. Last week a hurry call came from the San Francisco Feeder Company for four cow-boys to rope cattle which had just been received from Arizona. Most of the Rodeo cow-boys were away fighting fire in the Lone Tree country, so Moy and Fallon responded alone.

How keenly this announcement awakens us to the fact that handling live stock is really a thing of men and not of mechanism. And how suggestive it is of the fact that the future development of California, in all the fullness of which it is capable, depends upon the owners of lands and capital who will employ them both in the extension of our live stock products. And it is particularly significant of the fact that our great areas for fruit and field cropping are adjacent nearly everywhere to even greater areas which should be populated with animals to their full capacity for their safe support. South of the Livermore valley, with its wide plains

for grains, forage and field vegetables and its wide mesas for fruits, and east of the greater Santa Clara valley, with its already realized multitude of millions from orchard, vineyard and field products, lies the Berryessa valley and its environment of hill country running eastward to the San Joaquin, and southward to infinity in capacity for range production. Into this grazing region, as the above announcement indicates, there come a thousand cattle to be branded in three days and set free upon the range. It is, of course, only a drop in the bucket-capacity of the region, but it splashes out two things at least. One is the fact that California will increase her grazing stock until her grass is turned to wealth for the upbuilding of the State. Another very significant thing is that we still have skilled men in California who will meet an emergency by no six or eight-hour schedule, but will work as long as they can see or stand to achieve what the industry, in which they are skillful, requires. Such men as Moy and Fallon should be honored—they strike nothing but the trail which leads to what the business requires of them! Some poet should write of the ride of Moy and Fallon from Livermore to Berryessa! There have been great rides in history and great events have hinged upon them, but probably, in relation to their truth to the interests involved, none was greater than theirs. It is true: "the cow-boy is not a thing of the past."

THE DUTY OF CALIFORNIA STOCKMEN.

Out from such a stirring incident comes a train of suggestions—timely and significant in our live stock development. First of all, perhaps, the very existence of it depends upon men loyal to their employer's interests and handy with a horse and all the paraphernalia of the range, the rodeo and the corral. It is a business which utterly refuses to be bossed by the clock. If a young man will meet its requirements, it gives him about the best chance in the world for getting on. If he lives right and rides well for another, he will ere long have others riding for him and (as we learn from the movies) has the best chance of the whole country to have the lovely country school-maam riding with him. The cow-boy who is true to his manhood and to his job is a noble fellow. California, with her adaptation to producing types, can give the country the best type of cow-boy, and California is on that trail right now. Young men of our congregation think it over and see if that is not what California has bunched up for you!

But to prepare for the coming generation of live-stock men those who now own the cattle and own or lease the lands have a very important duty to perform. It would be very easy to stock up our ranges and go broke or be in slavery, unless it is done right on the financial and commercial sides—therefore it is up to the present generation to go to the economical bottom of the business and build it up on a fair-play basis. A good start has been made in that line by the organization of our cattlemen's and other associations in animal industry, but we have not yet gone deep enough into economic and cultural principles for a good foundation, nor far enough to secure the co-operation of all who have put time, money and land into live stock production—both in small ways and large. If the business attempts to build itself autocratically it will soon be sawing wood in Holland! If it attempts to build up radically it will flatten out like the Bolsheviks! What it needs is a sound democracy representative of every man and woman who owns an animal and respects himself for having earned the right to own it, and to secure a fit share of the rewards rendered by the increase and the products thereof. Every animal owner in California should be associated with some other owner to this end. Any man who cannot do more for this great State business and his own, than to put in his time envying the trusts and denouncing the demagogues without doing a thing to save the industry from both of them, is really not fit to own and determine the future of a jackass.

WHAT SHOULD CALIFORNIA STOCKMEN DO?

We do not know just what should be done for our great live stock industry. In this respect we differ from the trust-advocates and the government-ownership advocates, for both of them are trying

to make you believe that they know exactly what should be done. We do know, however, that above and beyond what all the factions are now doing by shouting themselves hoarse over their cures for the high cost of living, they are all doing politics and what the producers need is to see into and under their game and decide what really needs to be done to insure the stock owners a fair reward for their labor and investments and to furnish the consumer food at fair cost of production and handling. We do not know how to do that, but we believe the producers can find it out if they go about it in the right way, and that is by the force and insight of associated wisdom.

There are many reasons to believe that the hulla-baloo which is now assailing the ears of the whole country from Washington is a twin product of politics and profiteering. If they were squarely arraigned against each other it would not be so bad as it now is, because politics vies with baseball as a Great American game, while profiteering is a kind of European autocracy—even though it be pretty well acclimated in this country. The trouble arises from the fact that so many are doing profiteering to buy politics, and so many are doing politics to sell to profiteers. That is the reason why those who honestly desire pure politics and fair profits have to get together and see if they can demonstrate what is pure and fair—if there is any such thing in the heart of a man.

TWO SIDES OF A HIDE.

What can any man all by himself make out of these announcements in the way of determining the facts he needs to know, viz.:

WASHINGTON, July 28.—Ability of the "big five" packers—Swift, Armour, Morris, Cudahy and Wilson—to determine from day to day the general level of live stock prices was declared incontrovertible in the third section of the Federal trade commission's report on the industry made public tonight. The "big five" have an interest in twenty-eight of the fifty principal market yards of the country and a total voting stock in twenty-two others. It was said they buy most of the live stock sold at these yards. "They discriminate against and put at great disadvantage independent buyers who are their competitors," the report said. "They manipulate on occasions the live stock market in such a way as to cause extreme and unwarranted fluctuations in the daily prices paid for live stock. They have eliminated many competitors and prevented new ones from coming in. They have restricted the meat supply of the Nation by manipulating the daily live stock prices, thus discouraging the producers of live stock."

And then this:

WASHINGTON, August 4.—In the debate in the Senate today, "the packers are not to blame for the high cost of living," Senator Sherman asserted. "They only made 1.6 per cent profit on all their business," he said. Senator Smoot urged the American people "not to lose their heads over this thing. If any members of Congress wants to know where to begin," he said, "let him begin with the retailer. The whole system of distribution is wrong and too costly. As long as retailers agree on prices, I doubt whether local action against individual offenders will be sufficient."

HOW WASHINGTON WILL PULL IT OFF.

What can the isolated man make of these two declarations, or what can he do about it if he thinks he can see through it? The leaders at Washington go at it by appointing investigators, but their investigating committees or commissions are made of three ingredients, viz.: one part serviceable politicians, one part professional experts, one part representatives of federated labor. All farmers are excluded just as all packers are excluded, because they are held to be "interested parties." And the report will deal a straight slap at the packers and a side-swipe at the farmers in the recommendation that the packers shall be "regulated" and the farmers shall have a selling price fixed—without regard to the fact that labor is allowed to strike until wages are raised to an equivalent to the new cost of living, while prices to producers are fixed so as to bring the cost of living down to the old rate of wages!

So far as we can see, it is up to California live stock men to help clear the way of all such economic snags which politics and profiteering are now setting up for popular delusion. By effective organization they can take part in the movement to secure proper agricultural representation in all governmental dealing with agricultural interests.

and thus safeguard the wonderful development which is coming to California live stock industries.

HOW OHIO WOULD CHEAPEN CATTLE!

But perhaps we are taking this matter too seriously. Certainly Governor Cox of Ohio thinks it could be very easy to solve the problem. He is credited with this recipe:

CINCINNATI, Aug. 2—"The whole structure of the high cost of living can be made to collapse quickly by knocking out the main props," Governor James M. Cox of Ohio, here tonight said: "The main prop is the present high price of wheat fixed by the government at \$2.26 a bushel. Knock out the prop and the structure will tumble. Reduce the high artificial price of wheat approximately to the level held by wheat before the war. The government can make up to the farmers the difference between the guaranteed price of \$2.26 a bushel and the new price. Reducing the price of wheat will cause a quick drop in other food prices, in my opinion. Corn will move in sympathy, as usual, so that with a reduction in the cost of feed, there should be a prompt decline in the price of beef-producing cattle. Lower cattle prices mean lower prices for meats, of course, and also for hides, which, in turn, will influence lower prices for shoes."

We hope it would also reduce the price of hats for a head which created that idea ought to have a larger one immediately. Governor Cox does not seem to know that the government price of wheat is too low, not too high, in relation to cost of production, and what a wreck it would make of the country to make flat prices like those of 1914! Lloyd George said the other day before the agricultural committee of the House of Commons: "No one can imagine prices are going down much in the next year or two. The shortage of raw materials and foodstuffs is too world-wide to permit a reduction." But Governor Cox innocently thinks that it would be all right to drop the price of corn and meat and hides. He forgets that the meat and hides have been growing two or three years upon corn and other feeds at war prices and have been cared for at war-time wages, etc., and that it would be confiscation and ruin to farmers and all their creditors, too, if it could be done—which it could not. It is, however, a fair sample of the "statesman's" solutions for agricultural problems!

QUERIES AND REPLIES

By the Editor.

Inquirer Must Give Full Name and Address.

Leaf-Glands Not Dangerous.

To the Editor: I am sending four leaves taken from four cherry trees. Two of the trees will be two years old next spring, and two one year old next spring. Every leaf on the trees is infected with the little growth which you see on the stem. Can you tell me what they are and to what extent they will damage the trees?—H. S. W., Menlo Park.

They are the natural excrescences on the leaf stems, which are often called "leaf-glands." They are just as much a part of a cherry tree as the prickles on the leaf stem are parts of the rose bush. Why they are there and what they do we do not know.

How Do Spiders Do It?

To the Editor: There have been more spider's webs this year than I ever saw before. Where do the spiders get the web and how do they spin it so fast and such strong webs?—Reader, Orland.

The spider carries the viscous liquid out of which the web is formed in an inside pocket. As this liquid comes out into contact with the air, it thickens and solidifies and becomes tough and strong. It is drawn out of the spider's pocket by two organs called spinnerets. God only knows how the spider came to have such good, rope-making materials and machinery.

Will Be Same, But You Know Not What.

To the Editor: Will a scion from a tree not yet in bearing (though of good stock) produce as good a tree as one taken from a bearing tree. Some of my neighbors contend that it will not, while others say that it makes no difference.—R. B. W., Morganhill.

The growth on the scion will be the same as the young mother tree from which it is taken. It is not a wholly safe proceeding, however, for you can not know what the mother tree will yield until you see it. For this reason buds and scions should only be taken from bearing trees and from

the trees bearing the best types of the kind and the most of it. So far as strength of tree goes, it would be as good from a young tree as from any other, but it may be longer in coming into fruit than a scion from a bearing tree.

Tip-Bearing Apples.

To the Editor: My apple trees bore for the first time this year—with clusters of fruit at tip ends of long branches. Would you advise summer pruning these long branches in hopes of fruit setting inside next year?—R. E., Butte City.

You will have to get more tips on short laterals or spurs from the larger branches to distribute the fruit better. It is probably too late now to start new shoots. Pinching should have been done nearly two months ago. You can guard next year's crop by not shortening this winter the laterals which you now have which are old enough to bear next year. Early next summer you can pinch for more tips if it seems desirable.

Nematode Vegetables.

To the Editor: I send two roots: one of a crooked-neck pumpkin, the other a cantaloupe. What is the matter with them? They seem to die gradually. Tomatoes are also dying from the same cause. What can I do to prevent return of this next year?—I. A. R., Turlock.

You send about the finest specimens of nematode infestation we ever saw. The roots are knotted so that they look like a succession of disks on a string. Nematodes are small eel-like worms (the males) and pear-shaped, pearl-colored bodies (the females)—which are bedded in the substance of the root they infest. They are too small to be seen by the naked eye, though their glistening can be seen when the substance is broken open. Their presence is revealed by the distortion which they produce on the roots they infest. They remain in decaying roots until new roots grow for them to go into. No treatment is practicable. You must run away with all flesh-rooted vegetables to a new piece of ground and use the infested ground for grain or hay for a year or two.

Olives Needing Drainage.

To the Editor: When we planted olives we did not know that we had clay underneath in some places—sometimes only 16 inches down; sometimes deeper. Last year the trees showed too much water. What do you advise in soil treatment to avoid the clay, which prevents drainage?—W. R. Q., Yuba county.

You have three choices. One would be to irrigate very carefully and very often in small amounts, so as not to swamp the shallow soil over the clay spots. The second would be to under-drain these spots with tile if you can get an outlet into gravel, which would carry away the surplus. The third would be to shoot the spots in the middles with light charges of powder, so as not to injure the trees and thus make fissures through which the water would sink or flow away to strata which would dispose of it. As the land is spotted, this might be quite feasible. You ought to put in spare time this summer in prospecting with a spade or soil-auger, see what you really have below, and make a map of soil depths and characters so that you can see how to relieve the shallow spots.

Leaf Stem Gall on Cottonwood.

To the Editor: I send a leaf from one of the cottonwood trees in this locality. The growth on it has some form of insect in it. Most all the cottonwoods in this vicinity are affected the same way. Will you kindly tell me whether the insect is injurious and what to do to destroy it?—J. N., Palm-dale.

The large circular swelling on the leaf stem, just below the blade of the leaf, looks like a large bead on a string. The gall is caused to grow by a minute plant louse, which lays eggs at that point and keeps on laying them until she has the gall filled with them. They are the insects which you see and their name is Pemphigus populicaulis. There is probably nothing which you can do to catch up with this inhabitant of the tree which has lived upon it from time immemorial. It will not kill the tree because it will be held in check by its natural enemies. This is nature's plan to keep her wild life alive. It is only when man upsets the scheme by his operations that he has to get in and fight for what he tries to grow. The cottonwoods will take care of themselves. We find on opening

Here is work you will like—a free, independent life in the open air, attending to our renewals and securing new subscriptions. Pays well, too—straight salary, with unlimited opportunities for advancement. No investment necessary except that you must have an automobile.

If you think that, with proper training, you could make good, write us a little about your qualifications and experience, and we will send you full particulars of what may prove your opportunity to connect up with Great Success. Better investigate, anyway.

the galls that a louse-eating larvae is in the midst of them. Nature is on her job—don't worry!

Almond Roots for Peaches.

To the Editor: As peach seedlings are very short throughout the State this year—not over 40 per cent, I have been figuring on the advisability of working some peaches on bitter almond root. Please advise me if, from your wide experience and observation, it is advisable. Do they make a good union? Do they make a tree as long lived and as productive as on a peach? Are they more or less subject to sour sap?—F. F. E., Newcastle.

From the earliest California times the almond has been used for the peach and the hard-shell sweet or bitter almond seedling has been commended as the best of the almonds for this purpose. Many of these old claims for the particular kind of almonds have never been either demonstrated or disproved, but experience certainly shows: (1) that the peach takes well to any almond seedling; (2) that the almond root carries the peach on a deep, loose soil better than the peach root does; (3) that the almond root on a soil which holds water too long is more quickly subject to sour sap than the peach root, although, even on a heavy soil, the almond root may be very thrifty and long-lived if the soil does not get water-logged. The almond root is also somewhat more subject to root-knot. The use of the almond root for the peach has, however, always been largely a question for cranks and academicians. There has never been 10 per cent of the peach trees worked on almond seedlings, which may be due to the fact that peach pits are cheaper and easier to get.

A Shy-Bearing Apricot.

To the Editor: I have a five-year-old apricot tree, 12 feet high and with a spread of more than 12 feet. It is a very healthy tree, but had but little fruit this year. What there was of it were very large and fine flavor. There were very few blossoms at the top. From the first year I have pruned by cutting back each year all new growth to one foot. Is that right? Should some shoots be cut back to the parent branch? I was told by a horticulturist that I should prune the tree this summer as soon as the fruit was off, and give it plenty of water to start new fruit shoots. Is my information right?—C. T. I., San Diego.

Cutting back to one foot is a recipe—not a rational pruning operation. You may in some cases have cut back too much and in some cases too little. It is often desirable, for one of several reasons, to remove a shoot entirely as you suggest. The advice given you to stop winter pruning is good, and unless this season's growth is very heavy, we would not cut it back now, but there is probably a chance to thin out, that is, to remove entirely a number of shoots which have made a rank growth—saving the short shoots or spurs which can give you bloom and fruit next year. We see no reason to force more shoots as late as this unless all small growths have been skinned off in previous pruning. Reasonable irrigation is desirable to keep the leaves active for a couple of months or more. Stopping the cutting back in winter may cause your tree to bear, but it will not certainly do that for some of the large apricots which are shy-bearers in spite of all treatments thus far prescribed for them.

California Weather Record.

The following rainfall and temperature record is furnished the Pacific Rural Press by the United States Department of Agriculture Weather Bureau at San Francisco for the week ending August 5, 1919.

Stations—	Rainfall			Temperature	
	Past Week	Seasonal To Date	Normal To Date	Highest	Lowest
Eureka01	.02	.11	62	50

American Beans and Oriental Imports.

Written for Pacific Rural Press by R. E. Hodges.

THE BEAN MARKET has started what is termed in some quarters a "speculative rise," based on short acreage in all principal producing sections and poor conditions in most of the areas planted. Six States produce normally about 90 per cent of the commercial beans in the U. S. These are, in order of their production last year, California, Michigan, New York, Colorado, New Mexico, and Arizona. Their total production last year was 17,437,000 bushels and was forecasted by the U. S. Department of Agriculture on July 1, at 12,302,000 bushels for 1919. Probably this forecast was what started quiet buying. Now that it is more widely known, prices have gone up on most varieties and therefore the owners are holding for still higher prices.

U. S. Acreage and Condition Low.

California's acreage is only 70 per cent as great as last year, being estimated at 415,000 now. The crop conditions, especially in the coast counties, are poor and our total yield looks not over 5,602,000 bushels as against 8,584,000 last year.

Colorado's acreage of 252,000 last year produced a crop which made everybody sore because they couldn't sell it. Thus only 90,000 acres were planted in that great bean State in 1919, and a recent visitor to their fields reports the crop in poor shape, due to shortage of irrigation and ravage by insects. Its condition was estimated July 1 at 74 per cent of normal, as compared with 94 per cent a year ago. Colorado's forecasted crop of 866,000 bushels seems likely to be beaten by New Mexico this year.

Michigan has grief most every year, one way or another, but growers in the best yielding districts stood by their guns and put in full acreage there, though the total State acreage is reduced from 543,000 last year to 353,000 this year. Its condition July 1 was estimated at 90 per cent, but it has rapidly grown worse since then. Last year's Michigan crop is practically cleaned up.

New York, which produced 1,660,000 bushels from 200,000 acres last year, has only 108,000 acres this year and its condition is poor.

Arizona and New Mexico are increasing their production this season, the former from 72,000 bushels to 137,000 and the latter from 596,000 to 913,000 though the acreage in each is less than last year, and unfavorable conditions may yet reduce their favorable prospects.

Will Tariff Prevent Imports?

Dealers are inclined to believe that if growers succeed in getting a tariff

on Oriental beans it will make no difference in the amount of imports, but will simply reduce the Oriental growers' profits. They say that even a three-cent tariff could be taken out of the price paid to growers in Asia and production would still continue for export.

However, true this may be, it is a fact that Californians are unable to attract ships desired to carry our products to the Orient, because there

the captain of one of his ships, which was at that moment returning from Japan with practically no revenue load. This being the case, it is small wonder that beans are carried on the return trip at 75 cents per hundred. Freight rates could be reduced to nominal sums.

Shall Bean Imports Alarm Us?

Just how important Oriental bean imports have been may be judged by the quantities imported and exported

1917, came a remarkable jump to 3,747,993 bushels total imports, of which Oriental beans comprised nearly one-half and were nearly four times as great as in the previous year. In the year ending June 30, 1918, came another increase in imports, totaling 4,145,625, of which Oriental beans comprised considerably over three-fourths. In the eleven months ending May, 1919, our total imports of beans were 3,713,122 bushels, showing no great increase over the preceding twelve months.

Exports Increase.

We exported 1,530,392 bushels of these as compared with 724,596 in the entire year ending June 30, 1918. We should feel just that much less pressure from the foreign beans now. In addition, we exported 3,934,819 bushels of American-grown beans in the eleven months ending May 31, 1919, as against a third that many in the twelve months ending June 30, 1918. This should relieve the pressure still more.

During the eleven months mentioned, we exported more of our own beans than the total imports, and in addition we exported five-twelfths of all that we imported. Of the seven-twelfths which we imported and kept, a large proportion has gone to the canneries.

It appears from the above study and from the fact that our net imports of beans in the eleven months ending May 31, 1919, comprised only one-eighth of our 1918 production that we need not be greatly alarmed by the imports. This feeling may be further strengthened by the rice shortage in Japan whence most of our Oriental beans have come. If rice is scarce, the Japanese may raise fewer beans and eat more of them, thus keeping them off our markets.

More Tariff Would Be More Fair.

However, it will be only fair to American growers whose interests the consumers also must consider if food-crop production is to be assured, that the Government should place a tariff on Oriental beans grown by cheaper labor than Americans. Such a tariff is sure to do some good, not only in reassuring growers, so that we may not be endangered by depending on a foreign country for a staple food, but also by the revenue which may help pay our war debt, and perhaps by actually preventing some Oriental beans from competing with our own. Have you written your Congressman and Senator in favor of a tariff as we urged in the issue of July 26?

Thousands of ranchers in California use tractors for plowing, disking, harrowing, hauling, threshing, and all kinds of belt work, but not a large proportion have yet learned to adapt row crops to their tractors. Motor cultivators of several makes are now taking the place of horses where horses were supposed to be making their last stand. Rows may be of any distance apart and any length for the motor cultivator is adjustable to row widths and it turns about as short as a team of horses.

is not enough return load to pay under present conditions. Many ships return with ballast, which not only pays no revenue, but costs money to load and unload. Statements have been made regarding the immense tonnage of merchandise on Oriental docks awaiting ships. Such a statement was made at a meeting in San Francisco recently, but one of the best known of the ocean shippers said that if it were true he was going to fire his organization in the Orient and

as shown by U. S. commerce reports. The total imports of beans to the United States were around a million and a half bushels in the year ending June 30, 1914, of which only one-sixth came from the Orient. In 1915 the total imports were smaller, but those from the Orient comprised well over one-third of the total. In the year ending June 30, 1916, the total imports were still smaller, but those from the Orient comprised over two-thirds. In the year ending June 30,

An Efficient Home-Built Fruit Drier

(Written for Pacific Rural Press.)

When the drier was first built a two-foot fan was installed which ran at the rate of 1,000 revolutions a minute but it was found insufficient. The distribution of the hot air was uneven and a settling back of moisture resulted. So the large seven-foot fan was designed and built. It has four-inch-wide wooden blades set at a windmill angle with a binding of iron round the outer rim like the tire on a wheel—the hub plates being of boiler iron. The spindle looked to be about one and a half inch. This fan was built by the local blacksmith for \$12 about four years ago—would probably cost three times that much now. It runs at the rate of 450 revolutions a minute and takes a 15 h.p. engine to run it steadily. Mr. Swenson has a Moline tractor and could utilize that, only he happens to have the gas engine as well.

Time for Curing Grapes.

Mr. Swenson said that it takes about 75 hours to make finished raisins out of a batch of grapes. The large fan and large narrow building conducts the heated air to every stack of trays and carries off the moisture completely, though the ventilator

shaft looked pretty small to us. Nevertheless, he said it was quite large enough—about two feet square in capacity. Last year, after the rains, he dried 18 tons of Muscat raisins for himself and about the same tonnage for his neighbors. He says, "I look upon my home-made drier as a pronounced success. It is not only an insurance against loss by rains—and that may come any year—but it reduces expense by curtailing time needed for curing and allows us the possibility of letting our grapes stay on the vines longer without fear of loss. The longer the grapes stay on the vine the more sugar they have and the less moisture. Sugar means weight. The grapes, too, are of better quality, and cure better by being left on the vine as long as possible."

Supplements Sun-Curing.

Mr. Swenson's plan is under suitable conditions to at least start curing his raisins in the sun in the ordinary way and then, if necessary, to finish them in the evaporator. He has ten acres of muscads and 7 acres of Thompson Seedless as well as 15 acres of peaches and two of apricots, so that whatever happens he feels he

is well able to take care of his drying fruit without any particular anxiety with regard to the weather. There is a large crop of fruit and grapes set now, and Mr. Swenson can view it without fear of fall rains on the dried or semi-dried fruit. The outlook for a good crop of raisins in Tulare

SPEEDING UP PRUNES BY SUMMER PRUNING.

(Written for Pacific Rural Press by C. E. Leek, Hopland.)

I am sending you a photograph of a five-year-old prune orchard in full bloom. This was summer pruned and pinched back the first two years, but not headed back after that, but thinned in the winter and suckered in summer. This bore 100 pounds prunes per acre the third year, one ton the fourth year and looks like five tons the fifth year now. I have some younger trees that look even better for their age.

You cannot emphasize the summer pruning too much if you want trees and fruit too, which is the object of planting an orchard.

Thompson Seedless and Sultanas are estimated at 90 per cent of normal in Yolo County, and are in fine flourishing condition.

G. A. Swenson of Tulare county (on Kings River) has a home-built drier which he uses on raisins in a poor-drying season. It is said to be the only plant in his vicinity that was a pronounced success last fall in saving the raisins. He attributed this largely to the enormous fan used in circulating the heated air and carrying off that which is moisture-laden. That fan is the first thing to attract one's attention on entering the plant, for it is seven feet in diameter. Mr. Swenson explained how he came to install such a fan.

The Building and Equipment.

The entire structure is only 40 feet long by 14 feet wide and about 9 feet to the plates. It is built of rough lumber well sealed—just one plain long room. It holds 3,000 trays of grapes to a charge. The moist-air ventilator is one end of the building and the furnace and fan the other end. The furnace is a three-foot boiler plate drum of ¼-inch iron heated by an oil burner burning stove distillate, which, with a regulated intake of air keeps the drum very hot. An iron sheet covers this to keep the heat down and directed towards the fan in the boiler-house, while a brick or two out of the wall allows for the intake of air from the outside to be heated in passing through the boiler chamber.

Letting Pigs Make Hogs of Themselves.

Written for Pacific Rural Press by R. H. Whitten.

Feeding hogs is an art. But who is the better artist—the farmer or the hog himself? We want a pig to make a hog of himself, but do we give him a fair chance? The commonly employed system of hand-feeding is based upon the arrogant assumption that man knows more than the hog. Undoubtedly he does in most respects, but nowadays the wiser a man becomes the more he realizes that a shote knows better than any man what it likes and wants, when it wants it, and how much it can use to the best advantage.

This simple fact, deduced from numerous practical tests with self-feeders, represents the most important step that has ever been taken in America toward a sounder, simpler and more economical method of hog feeding. With efficient farm help scarce and wages high, the progressive farmer would like mighty well to remove hog feeding from his list of twice-daily chores, and if the hog can feed himself as well as, or better than, the most expert feeder, why not let him do it?

Hogs in the wild state were self-fed animals, living upon such feeds as would satisfy their appetites, and under domestication why should they not do their best when fed by the same principle? It is acknowledged that best results are obtained when they are on pasture instead of in a dry lot, and why? Largely because they have an opportunity to balance their own ration and eat as much of alfalfa, or whatever the pasture is, as they desire to go with the grain that is thrown over the fence to them.

Hogging down crops is nothing more or less than a self-feeding system; so is giving hogs free access to water and tonics. Many feeders place salt, charcoal, ashes, lime and other ingredients before hogs, believing that they will mix them in with their daily diet in a better and more economical way than when they are mixed with the feeds and doped out as so much unwelcome hash. And doesn't it seem queer that these feeders have utmost faith in the ability of the hog to choose such feeding materials, yet they hesitate to trust him with high-priced feeds, such as grains and tankage?

As Prof. Evvard, of Iowa, the leading swine feeding authority of the United States, says: "Man himself is a self-fed animal. He has made the dairy lunch and cafeteria system of eating popular because it is efficient in administering to his needs. He believes soup to be an appetizer and eats it at the beginning of a meal, and science has shown that he is right in this. Disregarding expense, he prefers the a la carte method to table d'hôte because in the former he chooses and in the latter he does not. He does not relish hash even as a side dish, ordinarily. Then why should we expect swine to relish it as the one and only dish?"

The Economical Way.

Some persons have argued that the hog is a physiologist, not an economist, and that he chooses his feeds regardless of their monetary value; therefore, while self-feeding may be a quick route from pighood to pork, it is not an economical way. These persons believe that if the grain fed to hogs on pasture is limited, more storage will be eaten and cheaper gains will be produced. But this belief is not substantiated by the numerous feeding tests that have been conducted. It has been proved that a full feed of grain to hogs on good pasture not only produces the most rapid gains, but also gives the most profitable results—sometimes marks the difference between profit and loss.

At the Kansas Agricultural College, two lots of pigs averaging 79 pounds each were bought at \$19 per cwt. and put on a 100-day feeding test. They received exactly the same feeds, but one lot was self-fed and the other hand-fed. Those in the first lot made an average gain of 1.83 pounds daily and a profit of \$7.15 per head, while those in the second lot made a gain of only 1.25 pounds daily and a loss

of 20 cents per head was the result.

The lesson, according to the Kansas authorities, is that a hog does not need any advice or guidance as to when and how much he should eat. Here at our own University Farm the results of different tests lead to the same conclusion. In one experiment there were 8 lots and the 4 leading pens, judged by economy of gain, were those that looked after their own needs through the cafeteria system, and with alfalfa pasture at hand to obtain exercise and keep up the appetite.

Short Route to Pork Barrel.

The Department of Agriculture made a compilation of results obtained with the self-feeder at numerous experiment stations throughout the country, with the following averages:

Number of Pigs	Method of Feeding	Average days fed	Av. daily gain head	Av. daily feed head	Av. amt. feed for 100 lbs. gain
262	Hand fed	82.2	1.23 lbs.	5.47 lbs.	445 lbs.
332	Self fed	68.5	1.92 lbs.	8.00 lbs.	417 lbs.

On self-feeders hogs make the most economical use of grain, fatten quickly, get to market early, reduce the risk, save labor and increase profits.

These results show clearly that more rapid gains are obtained with the self-feeder than by the best of hand-feeding methods, owing partly to the larger daily consumption per head, and partly to the more efficient use of the grain.

Another Government experiment with 275 shoats showed that in comparison with the hand-fed pigs, the self-fed pigs ate grain 19 per cent more rapidly, and gained weight 28 per cent more rapidly, yet consumed only 92 per cent as much grain in making 100 pounds. This shows conclusively that pigs eat more grain per day on self-feeders than when self-fed, but it also shows that this extra consumption is not wasteful of grain; in fact, it saves grain, for an increase of 19 per cent in the rate of eating caused an increase of 28 per cent in the rate of gaining. The chief object of feeding is to put on fat as rapidly and with as little grain as possible, and certainly a method which will increase the rate of gaining 28

per cent and at the same time decrease by 8 per cent the grain required to produce a unit of gain—certainly such a method is worthy of serious consideration.

When to Begin Using.

When shall pigs be put on self-feeders? There is a difference of opinion on this question. Some feeders claim that pigs started before being weaned do not stand up under the heavy feeding until they reach a marketable age, and that they not only go off their feet, but finish too chubby and light. They prefer to hand-feed pigs until they reach 75, 90 or 100 pounds in rather moderate flesh, and then finish them out on self-feeders. Others use self-feeders entirely, and with excellent results. Peters, Lam-

boars reach an average of 100 to 150 pounds they begin to get too fat, and it is then necessary to prevent them from making hogs of themselves too early by either using a filler with the grain or putting hinged doors on the self-feeders, so that they can be closed a part of the day, thus compelling the pigs to exercise more.

Alfalfa meal makes an excellent filler; also it is good to use with grain in carrying brood sows along, and for winter feeding in place of alfalfa hay. For growing pigs, use about 1 pound of the meal to 5 pounds of grain; for thin brood sows, 1 to 4; for sows in good flesh, 1 to 3. Watch the animals carefully, however, and feed more by eye than by measure.

Easy to Make.

There are many types of self-feeders, but all employ the same principle of letting the hog do the work. There is a hopper large enough to hold several days' supply of feed, and below it a trough into which the grain flows as the pigs eat it. Any farmer handy with tools can put together a most satisfactory feeder. The one illustrated was made by farm hands, and without any plans except rough sketches made by the proprietor. It has given excellent satisfaction. The roof projects enough to protect the grain in the trough from rain; the roof lifts up, so that the hopper can easily be filled from a wagon; the sides slide up and down, being secured by thumb nuts, and thus the opening at the bottom may be regulated according to the kind of grain used. To prevent rooting the grain from the trough, metal rods (long bolts) are placed across the trough about a foot apart. The feeder is mounted on redwood runners which do not rot, and it can easily be moved from one field to another.

Sometimes there is just one large hopper space, and mixed grain, or grain and tankage, is put in it. Again there is a large space for grain, and a small one at one end for tankage; or there may be two small spaces—one for tankage and one for tonic. Again, when two or more grains are used, there is a space for each grain, so that the hogs can balance their own rations. The kind and size that a farmer will want will depend upon the size of his herd, and the method of feeding that he adopts. Blue prints and directions for building different types may be secured free by writing the Farm Engineering Department, University Farm, Davis. Also, it may be well to write to the Division of Publications, Department of Agriculture, Washington, for a copy of farmers' bulletin No. 906, "The Self-Feeder for Hogs."

To Get Best Results.

Few instructions are necessary for the successful operation of self-feeders. Some of these devices clog and occasionally do not feed down properly, thus withholding some kind of feed. Even when a feeder is working properly, the feed in one compartment is likely to become exhausted before that in another, so look to the feeders frequently and don't wait until squeals proclaim that something is lacking. In such a case the hogs are sure to eat more heavily of the remaining feeds—often the most expensive ones—and this not only causes a loss of profit, but has a detrimental effect on the digestion of the hogs.

An abundance of drinking water should be provided, for hogs like to eat a little, drink a little, and so on, going back and forth until they have had their fill. A little at a time—that's the way they get their feed when their "mammy" nurses them. Why not let them keep it up? It is the case of letting the animal instinct take its natural course, and when it comes to such a natural function as eating you can bet on the animal instinct to win every time—at least, when you want the pig to make a hog of himself as quickly as possible and pay you the highest price for the keep.

Pork Production

BY ACTUAL TEST PURE HAWAIIAN CANE

MOLASSES

will increase pork production approximately five-tenths pounds daily over a barley and tankage feed, yet it sells for less than half the price. Do you know of any other feed at any price that will do this?

Why not get all the profits out of your hogs?

Write us immediately for a copy of above test.

The Currant of Commerce in a Wine Country

Written for the Pacific Rural Press by John J. Fox.

So long ago that history is lost in tradition, Southeastern Europe and Asia Minor were producing wine, also currants and other dried fruits for home consumption and for trade with the world. The Phoenicians doubtless carried currants, as well as wine, dates and olives, to all the ports of Europe, Asia, and Africa that existed. Until recent years the Latin countries, the Levant, Syria and Palestine have enjoyed almost a monopoly in the production of these things.

California Sails In.

But California has changed all this. First of all she became so proficient in wine-making that she was a serious rival to all wine-making countries. The light wines of Napa and Sonoma have established a reputation that is world-wide. The dates produced in Southern California are of excellent quality, and the crop is growing in volume. Last year we furnished nearly all the dried olives consumed in this country. The Near East never thought about so many raisins as we are producing. Now, since prohibition is in sight, we have turned our attention to the Zante currant—the Greek currant of commerce—as one alternative for the grapes used in wine-making—at least a portion of it, for the market in any event is limited.

Currant Possibilities in the Wine Counties.

The raisin sections of the San Joaquin and Sacramento Valleys can probably make more money out of raisins than they can by raising currants. The coast counties of Napa and Sonoma cannot raise raisins. Nor could they cure them without the use of evaporators. Table grapes are not within their scope for Emperors do not condition for the market. Tokays are apt to mildew, and they do not sugar well and anyway the table grape market could not be usurped by a county whose quality and production on strong land would be in the least inferior.

John H. Wheeler of St. Helena (Napa County) has proved that, under the right conditions, the Zante currant or Black Corinth grape can be raised there and ripened in time for drying, grafted on the wine grape stock. That is

One Problem Solved.

A demonstration meeting was held at his place at Zinfandel July 29, which was attended by many grape-growers, wine men and scientists from the University of California. Before proceeding to the field Mr. Wheeler addressed the assembly giving a general outline of his experiments and their results. The Panariti or Black Corinth is the variety demanded. The White Corinth and Pink Corinth were also tried out and showed excellent yields, but a demand for them has not yet been created. The White is the best grower and bearer, the pink next, but the black bears the fruit which is in demand, and so only the Panariti or Black Corinth is to be considered.

Cultural Requirements.

Mr. Wheeler first told us that the Black Corinth demands a strong soil, being such a free grower. Vines planted on poor soil could hardly be expected to develop into a success. Though the currants would doubtless do best in the interior valleys, he could still show us that they would do well in Napa and Sonoma on good soil. Phylloxera resistant stocks of course have to be used in these counties—the Rupestris St. George giving excellent results or such stocks as are generally used for Zinfandels. The Lenoir stock is an exception.

The pruning must be long and free. Mr. Wheeler has been using an equal number of long and short spurs, and ties up the vines to a stake with a view later to wiring like other seedless grapes.

Girdling the Wood.

The most important operation is the making of an annular incision round either the cane, the spur or the body of the vine at blossom time. This girdling at the proper time induces a heavy set and an earlier ripening of the fruit. Two parallel cuts are made completely round the spur, cane or

body of the vine, and the strip of bark taken out all around. This incision must be about a quarter of an inch wide and not wider than 5-16 at the widest.

Rollo Wheeler (the exponent's son) has just returned from the San Joaquin Valley, investigating experiments there. He told us that some men in Fresno had doubled their crops of currants by girdling the vines. There are said to be 100 acres or more there grafted on Zinfandel stock. He noticed that where annular incisions had been made round the vine below ground the vines were full and the fruit uniformly ripened. When the vines were left ungirdled, the bunches were light, feathery and uneven, the ripening was retarded and poor, and you could shake the bunch and many berries would fall off. The Whites made a better set and produced better bunches, but the demand is for the Black at present. He was surprised to see how the incisions below ground had healed over so smoothly, while those above ground all presented a

This cut exemplifies the way young Zante currants are tied up to stakes. Mr. Wheeler's vines, however, are not irrigated. Irrigation of vineyards is not practiced in the two counties named.

swelling. Girdling beneath or at the surface gives the "set" a thrust for about three weeks just when it is needed. This will be tried at the Wheeler vineyard next spring.

Mr. Wheeler said that the manager of the Raisin Growers' Association was of opinion that if conditions returned to those obtaining before the war, the Zante currant would not pay to raise. Greece was able to sell them to us at four cents a pound. They are dirty and have to be cleaned, but it would not allow over six cents for our product. Protection only would make the possibility of growing the Zante currant in California a success.

Pruning and Girdling.

Professor Fred T. Bioletti said that the Black Corinth had been tested in California for 25 years and had been a failure. This fact emphasized the importance of Mr. Wheeler's successful demonstration. The early failures were the results of improper pruning partly, for they were pruned like wine grapes instead of being pruned long. Secondly, no annular incisions had been made, with the result that one year there might be a crop and then two or three years followed with no crop. There must be a good crop every year. The little strips of bark must be taken out completely—all round or the effect is minimized.

The incisions made just below the surface of the ground completely circling the vine there, is the method practiced in Australia—is the cheapest method to carry out, gives a sharp shock to the vine at the time it is needed. The vine rapidly recovers and heals over the wound. Future girdling on the body or base of the vine should be at least one inch away from the preceding wound—either above or below it. To girdle the body of the vine above ground is harmful in the long run. It is better to girdle at the

surface of the ground and then cover it up with earth. The incisions should under no circumstances exceed 5-16 inch in width. About a quarter of an inch is right.

In the Field.

Mr. Wheeler showed us four separate and distinct experiments in the field of Panariti grafted on green Hungarian vines aged 18, 3, 15 and 12 years, respectively. The vines in each instance were girdled and ungirdled alternately all up the rows and showed conclusively the results obtained by girdling. Those with the incision showed good crops of nearly ripe currant grapes—perhaps 30 pounds on some vines—while those ungirdled showed feathery, insignificant, shapeless clusters of unripe fruit. The grafts were 15 months old. The Green Hungarians were on Rupestris stock in three instances, and there are eight inches of Hungarian wood between the Rupestris and the Panariti graft. Those grafted on Lenoir were very poor.

Method of Grafting.

Two scions were saw-grafted into each stock and then a piece of paper placed over the stub to keep out the dirt; no waxing, painting or tying. The stubs are painted the year following grafting to preserve them. Petroleum paints, with no strong acids, are used. The grafts on Lenoir stock

counties for a full yield from young vines on resistant stock. An average of one ton to the acre of dried currants can be expected on good currant land. Fresno has done this. Our imports from Greece the last year we imported, amounted to 15,896 tons, which was an average. If we averaged a ton to the acre, there is therefore room for us to produce 15,000 acres of Zante currants to fill our

THE SELF-OILING WINDMILL

has become so popular in its first four years that thousands have been called for to replace, on their old towers, other makes of mills, and to replace, at small cost, the gearing of the earlier Aermotors, making them self-oiling. Its enclosed motor keeps in the oil and keeps out dust and rain. The Splash Oiling System constantly floods every bearing with oil, preventing wear and enabling the mill to pump in the lightest breeze. The oil supply is renewed once a year. Double Gears are used, each carrying half the load. We make Gasoline Engines, Pumps, Tanks, Water Supply Goods and Steel Frame Saws. Write **AERMOTOR CO., 2500 Twelfth St., Chicago**

present requirements. We paid \$8,000,000 for this 15,000 tons. Greece's currant crop in 1912 amounted to 165,000 tons and in 1913 she had a carry-over of 7,500 tons. Prices in New York before the war were 6 to 7 cents a pound graded. We may assume that after things are settled they may be 10 to 12 cents a pound.

How Long to Cure?

Last year the Association took in currants from its members around Fresno guaranteeing them 12 cents a pound. But the members were paid 18 cents. At Watoki the raisins were harvested by July 22. The fruit was two days on the trays, two days in the sweat boxes and delivered at the warehouse six days after they were picked bringing the growers \$360 per acre.

Other Varieties

Have been tested by Mr. Wheeler with the annular incision, including Isabella Regia, Cabernet and Sauvignon. The Chasselas Fontainebleau and Muscat on Rupestris will also be ringed to try to produce earlier ripening for drying. He showed us some Chasselas Fontainebleau raisins. This seems to be good drying stock. The grapes tested 22 deg. Balling and cured $4\frac{1}{2}$ to one. They were dipped in ordinary prune dip and were cured in good order.

Summary.

To tot up the chief points demonstrated by the above experiments by Mr. Wheeler and his son and by Professor Fred T. Bioletti of the University of California, we will place them in the order of their importance as we gathered them.

First, the Black Corinth requires a

strong soil. This is rather disappointing, because it is our vineyard land that is really fit for nothing else that we were hoping would benefit. Next, it must be girdled at blooming time as explained. Special double-bladed knives are made for this purpose in Australia, Professor Bioletti tells us.

In phylloxera counties it requires a strong grafting stock, taking well on vinifera wood on these stocks. It requires long and free pruning and tying up or training.

NURSERY STOCK FOR THE COMING SEASON.

(Written for Pacific Rural Press.)

In an endeavor to ascertain the general outlook for nursery stock for the coming season we have visited a number of nurseries and from different managers' talks are able to give a general survey. One man says:

"This year's supply of nursery stock in the State is approximately 65 per cent of normal. Nurserymen planned and made their plantings for this year's budded stock December, 1917, and January and February, 1918, under the then existing war uncertainty, war labor shortage and war high cost of production, and particularly in view of the then existing uncertainties, and the fact that on account of the war uncertainties land improvements were being held in abeyance, it was generally deemed advisable by nurserymen to curtail their plantings. As a result, the supply of budded stock this year is not over 65 per cent of normal.

"With the cessation of the war, how-

ever, these plans for land improvements that had been held in abeyance are now being carried on, which, together with the enormously profitable fruit seasons of both 1918 and 1919 has created a demand for trees far in excess of the available supply, and while our own stock is up to normal, yet, with the heavy sales being negotiated, there will be a great shortage in trees, and the best sellers will be sold out before we get half-way through the selling season. In fact, our sales to date are what they normally are January 1st."

Another grower supplemented similar remarks with the fact that 1918 was a dry spring and a poor stand of seedlings was common with growers. He has not over 70 per cent of last year's stand, he says. With regard to prices he told us he had sold 15,000 prune trees to one corporation at \$450 a thousand. His supply of pears and prunes are about equal to last year's, almonds 50 per cent and 'cots shy of last year's.

Another nurseryman says, "My prunes and 'cots are fewer than last year. The shutting out of European seedling stock on which we used to depend, has lightened plantings, and last year's seedling plant is not so good as usual. Buying has begun this year in quantities earlier than I have ever experienced. Eastern buyers are coming to us for apple and plum stock."

Another: "We still have a good stock of prunes, pears and almonds, and while in other varieties our assortment is fairly complete, yet this won't last long under the present demand."

We mentioned some six weeks ago

that an early demand had developed for figs and walnuts, and apparently both these stocks stand a good chance of being cleared up early. Prunes, pears, almonds and apricots are a fair supply taken altogether. Peaches, in view of the demand, may be light with olives fair. Citrus stock is also fair.

All stock we have seen seems to be of fair average quality.

Planting young trees in the midst of old ones in the orchard is something like raising an infant in an old ladies' home. It becomes stunted in habit and prematurely old with small profit to anyone.

The retail prices of navy beans in New York in July, 1915, averaged 8.1 cents; in July, 1916, 11.3c; in July, 1917, 18.8c; in July 1918, 17.5c; and in April, 1919, 12.7 cents.

Alfalfa is displacing hemp on Ryer Island in Sacramento County, and an alfalfa mill is being built.

Pink-root disease of onions has appeared in the Delta, one infected field having been found.

CORN HARVESTER Self Gathering Corn, Cane and Kaffir Corn. Cuts and throws in piles on harvester. Man and horse cuts and shocks equal to a Corn Binder. Sold in every state. Price only \$25 with fodder binder. The only self gathering corn harvester on the market. That is giving universal satisfaction. - Dexter L. Woodward, Sandy Creek, N. Y. writes: "3 years ago I purchased your Corn Harvester. Would not take 4 times the price of the machine if I could not get another one." Clarence F. Huggins, Spearmore, Okla. "Works 5 times better than I expected. Saved \$40 in labor this fall." Roy Apple, Farmersville, Ohio: "I have used a corn shucker, corn binder and 2 rowed machines, but your machine beats them all and takes less time of any machine I have ever used." John F. Haag, Mayfield, Oklahoma. "Your harvester gave good satisfaction while using filling our Silo." K. F. Rueschitz, Otis, Colo. "Just received a letter from my father saying he received the corn binder and he is cutting corn and cane now. Says it works fine and that I can sell lots of them next year." Write for free catalog showing picture of harvester at work and testimonials. **PROCESS MFG. CO., Salina, Kansas.**

Tractor Chisel

KILLEFER
QUALITY

Now is the time to commence deep chiseling and subsoiling. Do it in time to prepare the ground thoroughly to receive the benefit of the winter rains. Break away from the old habit or mistaken idea of scratching the ground and expecting to harvest a crop.

All authorities are agreed that three elements enter into plant life, viz.: air, heat and moisture, and when these are totally or in part excluded by formation of plow sole, due to the old methods of cultivation, just to that extent is plant life cut short in some cases to total failure. How often is heard the statement that certain pieces of land are worn out and will not produce a crop, while we maintain that they are only shut out, and by this we mean, that owing to the formation of this plow sole, the elements above named are not allowed to penetrate the soil, which naturally results in partial or total failure of the crop, and it has been proven in every instance where this plow sole has been broken by subsoiling or chiseling, that as good or

even better crops have resulted from this operation the first season.

Our Tractor Chisel is being used by a great many ranchers who have proven its worth many times over, and as one successful rancher said in comparing the cost of plowing with chiseling, "We figure that the Tractor Chisel pays for itself every twenty-three days of continuous operation." This does not include the valuable time saved with the Chisel compared with plows, when so much time is lost in repairs.

Our Tractor Chisel is made from special high grade steel and will stand the strain of the largest tractors. Write for our booklet on Deep Tillage which will tell you what others have done and will do for you.

Send for Catalog and Prices.

Here and There in the Fruit Business

[Written for Pacific Rural Press.]

By-Products from Citrus Culls.

There are now four concerns in the South manufacturing lemon by-products, which have an annual capacity of 50,000 pounds of lemon oil, 500,000 pounds of citrate of lime, and 1,500,000 pounds of citric acid. Twenty concerns are producing orange by-products also, according to the U. S. Department of Agriculture, turning out 3,000 tons a year. This includes marmalade, marmalade stock, jellies and candied peel. These concerns have been developed since the establishment of the U. S. Citrus By-Products Laboratory in 1914, which has also developed methods for the manufacture of orange vinegar and candied peel and juices from cull grape fruit. Cull lemons have risen in value from \$5 to \$25 a ton and the same with oranges since these factories were established, part of which is due to increased general prices and the rest to this definite new market.

A Profitable Transaction.

Seven years ago W. G. Gard of Kelseyville, a teamster, planted out 20 acres to pears. He was to receive half the land for planting it and caring for it to bearing age. A few weeks ago he sold out his ten acres of 7-year-old Bartlett for \$10,000 or \$1,000 an acre—no buildings or improvements being on the place other than the trees. Mr. Gard probably never missed the time spent in attending to this place as he was working with his horses on other places, while this transaction brought him in the neighborhood of \$1,500 a year for the time he was working it.

Experimental Drier at Davis.

A small practical experimental drying plant has been installed at the University Farm at Davis, which it is hoped will serve as a model for small growers. The Viticultural Commission assisted in the cost. The many angles of temperatures and dehydrating will be studied for prunes, pears, grapes and peaches. It is now in action.

Olives in Placer County.

There is a very irregular set of olives in Placer county, making it very hard to estimate the crop, according to C. K. Turner, Horticultural Commissioner, who thinks it may amount to about 50 per cent. Plums are panning out according to his original estimate of 65 per cent.

Where's That Rabbit's Foot?

Last Friday we received a letter from Wm. Gould, Horticultural Commissioner of Yolo County (written on the 23d), saying, "I am sending you a branch from one of my Smyrna fig trees, which has 23 figs on. Don't you think that will beat your fig story of last week—the Capri that had only 13 on it?" The Capri was a single twig while Mr. Gould's was a branched one. We remarked on the size as well as the number of fruits

on the Capri fig. The figures in this story are "inauspicious!"

To Support Loaded Limbs.

Dr. Garrison of Healdsburg, in wiring up the limbs of his apple trees, bores a small hole through the limb, runs a stout wire through, turns down the end and staples it on the outside. This sounds pretty good and practicable, though the holes really ought to be stopped with asphaltum to keep out any fungus spores of heart rot.

Save Every Apple.

Every apple is worth money and will pay to ship even from distant points if the railroads give commodity rates. You folks up in the mountains, don't forget that dried apples are quoted at 20 cents a pound. A little sulphur house and two or three small apple-parers will make that family orchard turn out big money. Some of the finest winter apples we have come from the mountains. If they are carefully picked and cared for, the sound ones, free from worms, will be worth big money packed, and the rest can be cut at home. Those fine winter apples dry and weigh up well.

Berries in the Gold Ridge Section.

Blackberries, Lawtons and Mammoth, will probably not turn over half a crop this year between Sebastopol and Forestville, while Loganberries run from one-fourth to one-third of a crop—less on thin hill land. One man who has 100 acres of apples interplanted with berries, picked only 300 pounds of Logans to the acre, that last year went three tons. He has a nice crop of apples though, and that will help some.

Used Dry Lime-Sulphur for Scab.

J. W. Keegan, near Forestville (Sonoma county), has sold his pears at \$65 a ton—orchard run. He has a 72-acre ranch, half of which is in fruit. We noticed his pears were very scabby, though they were fine in size and generally good in shape. He explained that he used dry lime-sulphur, 16 pounds to 100 gallons of water before bloom and 9 pounds to 100 after bloom, and attributes the scabbiness to the use of this material. A neighbor used 28 pounds to 150 gallons and has clean pears. Mr. Keegan has a good heavy crop.

Picking Thompson Seedless.

The wastage in careless picking of Sultanas and Thompson Seedless grapes amounts to a very large aggregate loss each year with careless pickers. It pays to watch your men and see that the grapes are deposited on the trays and not torn off and thrown at the trays, and then the heap hastily straightened out. Every year one can see far more raisins lying along down the rows than there is any need for. With the money that is paid this year for picking and the good price promised for the dried product we have a right to expect extra good cares to insure quality.

Pears Have Been Picked Too Green

[Written for Pacific Rural Press.]

July 29—We have seen a lot of pears in various delivery stations that have been picked much too green as numbers of snapped stems testify. In Sonoma county picking started two weeks ago. Why is picking started on such immature fruit?

Several reasons present themselves. Many pear trees have borne and are bearing enormous loads. Props are dear and hard to get and expenses are high. Therefore, a rapid picking of pears has lightened the trees of their dangerous surplus and the pears have been accepted.

Another reason is that vacation season is on and the growers are using the help while they can get it. Every week more and more hands are needed by other industries as the harvest advances.

Some men say, "The pears are dropping, so they must be ready. Anyway,

I would rather pick them off than pick them up. A great many poor crops were sold at a flat price—orchard run. In short, it is an uneasy feeling that is prompting men to get that fruit to market and get the money for it so as to be sure they have got it.

It seems rather a pity that fruit should be taken so green. We have seen some sent in to be cut that will shrivel rather than ripen. This is not only a loss in quality for the dried product but a heavy loss in weight—for it is the sugar that pulls down the scales. The early pick is expected to be a bit green and uneven, but it doesn't pay to overdo it. We noticed a lot of orchards where straw and manure has been spread beneath the trees to save the windfalls—a wise precaution when they are worth at least \$35 a ton.

The **CHEMIST** says—
"genuine **GIANT** is
always uniform"

At every Giant Powder plant the chemical laboratory controls the processes of manufacture. They make continuous tests that insure the unvarying high quality of Giant Powders. Each pound of Giant Powder is exactly like every other pound of the same grade. Such uniformity means economy, efficiency, safety. Professional users of Giant Powders—miners, quarrymen, contractors—all know that the name "Giant" stands for utmost dependability in explosives. When you have land to clear, trees to plant, subsoil to be broken or ditches to be blasted, tell your dealer to get for you one of the Giant Farm Powders—Eureka Stumping or Giant Stumping. Don't accept any ordinary dynamite, but insist on genuine Giant Powder, bearing the Giant trade mark on every box.

A postal will bring you our book, "Better Farming with Giant Farm Powders." Its 32 pages are full of short-cuts and labor-saving methods.

LABOR IN THE STATE'S FRUIT HARVEST.

(Written for Pacific Rural Press.)

Some of the apple, pear, prune, peach and grape growers will be put to it to handle their crops, is the opinion of some growers in Sonoma County. We heard one grower ask another, "Can you tell me where I can get a few pear pickers? I am shy on help and my fruit needs handling." The reply was, "I let out two this morning who wanted \$5 for an 8 hour day. I was paying them \$4.50, and if they had been good pickers I would have kept them—but they were just putting in time and I had to let them go."

Stanislaus County is rather better served. A. L. Rutherford says, "Labor is plentiful, but not at all satisfactory. Wages are high."

"Labor is plentiful here at Paso Robles so far as orchard work is concerned, but there is not enough for the wheat crop," says Tom Henry of that city. "We have a very good wheat crop, and the almonds will yield 100 per cent or better."

Fred G. Stokes of Lake County says: "You ask about labor. We have enough at present. In fact to be fair to those who depend on work for a living, I may say that our labor situation is fairly well balanced, though others might say that help is scarce. No one has any difficulty in getting employment, but if you want to hire a man you must look ahead sometime as apparently there are few, if any, really good men looking for work. They are all busy, but it is not fair to say that any crops are suffering through lack of help."

"There should be more uniformity in the number of hours for a work day throughout the state and also even in the county. Around Kelseyville they work an eight-hour day and further north they give a nine-hour day or even a ten-hour day. Personally I have no use for the clock being ahead, as it throws the dinner hour too early on a ranch and most of the men go to work again in the hottest hour of the day. This is hard on both men and teams, and quitting at 5 p. m. (which is really 4 p. m.) just when it is pleasant to work, may be alright for a city man but is no good for the country."

D. F. Norton of Grass Valley (Nevada County) says, "I think we will be a little shy on pickers, but will be able to handle the packing as a great many women and girls have learned the trade during the past few years and are keeping things going."

"In Yolo county the only farmers complaining at the present time are the tobacco growers; they are experiencing some trouble in getting enough help to string the tobacco," says Wm. Gould, Horticultural Commissioner. "I have been told that Mr. Chiflokos has 40 mutes from Berkeley to do his work. One of our apricot growers, E. T. Anderson, lost about 1500 lug boxes of apricots due to the shortage of labor and the unusual hot spell which brought the cots on with a rush."

The Boys' and Girls' Aid Society have 125 children picking berries on the Gold Ridge at Sebastopol. The school boys and students everywhere are rendering good service during vacation. Their efforts will be missed in some growing sections when school "takes up" again.

C. K. Turner of Auburn says that up in that section there are more people looking for work than there are jobs. Labor is short in Napa County.

We have the worst hill yet to climb. It pays to see that the team is in good order and the gear sound before we have to negotiate that hill. Even where there's no hump there may be a crease, and you can't seize time by the short hairs.

CIRCUMVENTING MR. RABBIT.

To the Editor: I note in your last edition a query from a Napa County party asking a way to prevent rabbits from eating young fruit trees. I had years of experience along these lines, having tried blood, aloes, etc., with varied success, mostly bad, and at the best only temporary. I was

nose coming in contact with the prickly leaves of the live oak.—Sub.

"The cleanest crop of pears we ever produced in Mendocino county," said the Horticultural Commissioner of this year's yield.

A Message to California Peach Growers

(Written for the Pacific Rural Press by John J. Fox.)

In an extempore address to all fruit growers, and to peach men in particular, A. E. Sunderland, Secretary and Treasurer of the California Peach Growers' Association, gave out information that is of value to all fruit growers:

Then and Now.

In 1915 the maximum price paid to the grower for dried peaches was three cents a pound. Hundreds of acres of peach trees were taken out as the prices the growers were receiving did not pay actual cost of production, to say nothing of interest on investment, etc. In 1916 the newly formed association took over 1500 tons, which couldn't be sold at 2½c, and for these we netted the growers 5¼c through the Association. The average price for 1916 crop was 6c, for the 1917 crop 8.32c, and for the 1918 crop 11c, and it will be still more for the coming crop.

We recognize that the war has had some influence on prices, but it is co-operation rather than the war that has enabled us to put the industry on a sound basis. It has done two things besides giving us a voice in the disposal of our own products. First, it has given us control of the peach peeling machinery; and, secondly, it has given us the means to advertise our wares—something that can only be accomplished successfully by united effort.

The Peach Peeler.

The peach peeling process has revolutionized the peach industry and

placed a really palatable article on the market at a reasonable price that could have been obtained in no other way. For it has so reduced the cost, as compared to hand peeling, that we are enabled to place our Practically Peeled Blue Ribbon Peaches on the market in neat cartons in such an attractive, palatable, ready-to-eat form that they readily appeal to the discriminating housewives both as an article of food and confection. The first year the peeling process was installed 11 per cent of our total sales was in Practically Peeled form, in 1918 30 per cent, and this year over half of the crop will be marketed in this manner. We feel in a short time the once-despised unpeeled peach will be entirely replaced in all the markets of the country by our Practically Peeled, which will be a great advantage to the producer, as on account of increased sales and consumption it will mean there will not be a liability of an over-production of dried peaches.

The Progress of the Association.

The dried peach crop of 1916 was 30,000 tons; 1917, 20,000; 1918, 40,000; all of which was put into consumption without large carry-overs as in the past. We could not possibly have marketed this tonnage in the pre-organization days and the outlook for the coming season is that we could sell twice the amount that will be produced.

We have endeavored since our organization to instill into the minds of

the growers, for their own benefit, the advantage of better farming in order to produce the best quality, as well as quantity, of the dried product. We have had taken two reels of moving pictures showing the industry from the planting of the tree to the baking of Blue Ribbon peach pie by the consumer. In these pictures we endeavored to have shown the right and wrong methods from the spraying of a tree to the time the crop is delivered at the packing house.

National Advertising of the Blue Ribbon Brand.

Here are some of the results of consistent advertising and pushing: The jobbers are no longer afraid to buy because our prices are assured for definite periods. Freedom from market speculation and fluctuation of prices has established a confidence in the trade measured by the foundation of our industry. In the old days if the jobber saw no decided chance to make money on speculation he left our fruit alone. He didn't try to push sales as there was too much risk on a small margin. Under existing conditions of stabilization of the market by our Association the jobber cannot lose; consequently, our goods are persistently pushed by the jobber and sold to the retailer, who, by the assistance of our advertising, is enabled to readily resell to the consuming public. Thus a market continually active for all-year-around business is being built up to the ultimate benefit of the producer. This is exemplified by our operations last year, wherein we returned to growers 74 per cent of the entire gross amount received from the sale of their peaches, after deducting all overhead

and manufacturing expense—cost of marketing, processing, packing and material, labor, administration and transportation.

All fruit growers are now actively aware of what the growers' organizations have accomplished since they became established. This is not enough. With our rapidly increasing production in all lines we must keep pace by establishing new markets and enlarging our export trade, and this year the California Peach Growers is going to enter the European market where they expect to do a large business.

Proper and Improper Harvesting.

In conclusion Mr. Sunderland said: "A word to the growers before harvest is out of season. Pick your fruit when it is ripe—don't knock it off and gather from the ground. The results of the latter practice are: First—that you get a lot of slabs and dark-colored peaches that reduces your quality and values. Secondly—that a number of unripe peaches fall with the ripe ones if you "knock," and these do not show the right color and do not peel well. Added to this, the fruit that is unripe is not only poor in quality, but the producer loses in weight. It is in the last few days of ripening that the fruit sugars up and sugar means weight that cannot be evaporated. The added weight to properly ripened (and not overripe) fruit is enormous. The members of our organization work all together for the producer. The Association is their individual and collective business and each one must contribute his best productive effort to uphold its dignity and standing."

Test Special

There is much competition in Belt making. The buyer finds numerous kinds and makes, but yet identical in appearance and construction. There is only one safe and sane way to purchase a belt and that is to **TEST IT YOURSELF** and depend upon the experience and skill of the firm who made it. The firm that makes a Belt that has a reputation of **MAINTAINING ITS QUALITY** is the firm from which you know you can **SECURE A SQUARE DEAL**.

TEST SPECIAL RUBBER BELTING is manufactured by the **NEW YORK BELTING AND PACKING CO.** For 75 years we have supplied belt users with Belting that has won a reputation for its quality and service. When your purchase a **TEST SPECIAL** you receive the benefit of our 75 years' experience.

We know that when we put a **TEST SPECIAL** on your machinery it will give you long and satisfactory service, and we therefore do not hesitate to guarantee it.

The name "**TEST SPECIAL**," stamped on every 30 feet of belt, is your guarantee that it will give **LONGER AND BETTER SERVICE** than any other **RUBBER BELT** manufactured.

Fill out and mail the coupon. Get our samples of the belt which we will guarantee to do your work. Write today.

HORTICULTURAL JOTTINGS.

Peach packing is in progress at Porterville packing plant.

The first straight car of Malaga grapes was shipped from Clovis, July 29.

Elmer Bros. have sold their Tuscan clings from a seven-year-old orchard (10 tons to the acre) at \$110 a ton, to the cannery.

Some of the raisin growers in Yuba County are expressing a fear of early rains and that grapes are backward on account of cool weather.

Olive set is 90 per cent in Stanislaus County, according to A. L. Ruthertford, Horticultural Commissioner. Peach cutting began there July 25.

To handle their own crop of about 500 tons of grapes, a drying plant has been built near Yuba City by W. F. Hoke, J. C. Ray, and C. W. Jones.

Representative Kettner says he has every hope that favorable action will be taken on his bill providing for an import duty of one cent a pound on citrus fruits.

A great many of the pears in Sebastopol district were sold flat—orchard run—the prices being \$50, \$60, \$65, \$67.50 and \$70, according to the quality of the run.

Porterville's naval orange crop is estimated to run ten per cent over that of last season, while the Valencias promise to produce as heavy a crop as they have ever had.

Dried fruit houses in the San Joaquin Valley and other points are contracting for dried wine grapes up to 11 cents a pound, it is reported. Prices depend on variety and quality.

The Yakima Valley (Washington) promises about 2200 cars of Bartlett pears—a 15 to 20 per cent increase over last year, and the Rogue River (Oregon) from 700 to 800 cars of 512 boxes each.

About 1,500,000 pounds of surplus prunes of the 1918 crop have been thrown on the market by the War Department. They run chiefly from 40's to 70's and are mostly in 50-pound cases.

A straight carload of plums—Santa Rosa and Climax—from Newcastle was sold in New York City for \$3,150, according to the California Fruit Exchange. Some Beauty plums have sold at \$3.75 per crate.

Imperial and Sugar prunes in Yolo County will be ready about the third week in August, according to Wm. Gould, Horticultural Commissioner. The crop is showing up even better than his earlier estimates showed.

Joe Davis of Sebastopol, a prominent Gravenstein apple grower, has contracted 15 orchards besides his own, using them to feed his packing plant at Fulton. He is offering \$40 per ton for gravenstein apples.

The chestnut grove on the California Mountain Fruit Co.'s ranch at Grass Valley is loaded with nuts again this year. They are the im-

proved Rochester variety on sweet stock, and produce a nut equal to the imported stock.

A large new packing plant has been started at Healdsburg by Zerillo and La Fala. They are prepared to pack, ship, can and dry pears. Miller & Gobbi are packing two cars of apples a day here (July 29). Apples and pears are coming in fast.

The Libby Cannery workers at Selma are reported to have struck on August — to obtain a scale of wages recently established by Ralph P. Merritt, with the approval of Governor Stephens, after conferences with packers' and employees' organizations.

It is expected that 12,000 carloads of wine grapes—or call them jelly grapes—will be shipped out of the state this season if cars hold out. The wine grape crop this season will be approximately 600,000 tons, according to H. F. Stoll, of the California Grape Protective Association.

The California Packing Corporation recently purchased ten acres in Scott's Valley, Lake County, from J. H. Godfrey for \$3,000, for a drying plant, which will be in operation by August 15. This corporation has four units of this kind in Lake County to deal with the pear crop.

Prof. R. H. Taylor of the University of California has been appointed as assistant to the chief of the Division of Plant Industry by George H. Hecke, Director of the State Department of Agriculture. Mr. Taylor has had a wide experience, both field and laboratory, in horticultural work in California.

AGRICULTURAL NOTES.

About 800 pounds of new-crop sweet potatoes were shipped out of Turlock, July 25.

The fifth major convention of the National Board of Farm Organizations will be held September 16 and 17 in Washington, D. C.

Special arrangements to admit Mexicans for cotton picking may be made through the Director of the U. S. Employment Service, San Francisco.

One hundred pounds is the official weight of a sack of onions when sold "by the sack," as recently defined by the State Superintendent of Weights and Measures.

Sixty cars of lima beans, practically all that remain in growers' hands, are to be held over to help on the short crop which will be harvested this fall, according to Secretary E. O. Essig of the Lima Bean Selling Agency.

The Baart wheat pictured in our issue of July 19, as having been grown in rotation with rice, averaged twelve sacks per acre. It went 20 sacks on well-drained land, as reported by J. G. Beekler of the Dodge Land Co., who grew it.

THE AMERICAN

Government Wheat Price Not for Farmers

(Written for Pacific Rural Press.)

What is generally understood as the Government wheat price of \$2.20 per bushel will not be paid net to farmers for any bushels; and the misunderstanding should be cleared up. The \$2.20 price is for No. 1 clean hard wheat, delivered at San Francisco Bay terminals or Los Angeles terminals with weight of sacks deducted and with one per cent deducted to cover the Grain Corporation Administration charge. Farmers pay the equivalent of freight to San Francisco or Los Angeles. They lose whatever foreign matter (grain, straw, weed-seed, nails, smut, etc.) may be found in the wheat. Its weight is deducted before figuring the total payment. Inseparable foreign matter also reduces the grade and reduces the price per bushel correspondingly. Discolored, shriveled, wheat or soft varieties also take lower grades and prices.

Farmers Pay the Freight.

Farmers hauling direct to the mills must accept the Government price less the freight to Los Angeles or San Francisco, the mills retaining the freight charge to cover the cost of shipping the flour and mill feeds to the terminals, whence they are sent to world markets. They probably make a little on this, although the freight on flour is higher than on wheat, but the Grain Corporation recognizes that not every activity of every mill can always make a profit, so losses on some operations at some places some times are permitted to be balanced by profits in other cases and to a limited extent.

Weight of sacks is assumed to be $\frac{3}{4}$ pound each. This is deducted from the total weight, but $4\frac{1}{2}$ cents per bushel is added to the total price as a recompense for the sacks.

Government Price Is for Cleaned Wheat.

The wheat is bought always by the Grain Corporation or the mills all over the U. S. on a "cleaned" basis, which means that the weight on which the price per bushel is figured is the total weight less the weight of all foreign material. Such foreign material is loosely called dockage. Last season, California farmers were paid for valuable dockage because it contained some wheat which was not allowed to be used in chicken feed. But now that there is a free market for wheat and dockage, the rule has been made by the Grain Corporation that dockage will not be paid for up to five per cent, because as a general rule that is the cost of cleaning. Where dockage runs over five per cent, the Grain Corporation is paying \$1.25 per hundred for the excess except the straw, chaff, knuckles, etc., that are manifestly of no value for chicken feed.

There is a feeling that farmers are also entitled to payment for the five per cent on the ground, as President Geo. H. Sawyer of the Stanislaus

County Farm Bureau insists, that "all wheat is cleaned before it is manufactured into flour, the expense of this cleaning being part of the cost of making the flour and charged to the consumer. If the producer pays for the cleaning, the miller will be paid twice for the same operation."

Millers do run all wheat over their cleaning screens. If it has been cleaned previously it goes fast and costs but little for the last cleaning. If it is full of dockage it has to be run over the screens two or more times and it goes slower. There is more cost to the miller to clean foul wheat than to clean wheat from which the dockage has already been taken. How much more it costs we are not able to say. Five per cent dockage is assumed by the Grain Corporation to pay the costs of cleaning simply because, we suppose, that figure has proved to be about the average cost in California.

Western Flour Competes with Eastern.

But the following facts must be borne in mind. California flour is sold on the markets of the world in competition with eastern flour. If we handicap our western mills, it is possible that they cannot continue to handle our crop, in which case we would ship our wheat elsewhere, and return our millfeeds at some expense. Nowhere else in the U. S. has payment for dockage been given by the Grain Corporation. It was done last season in California on account of restrictions on the use of wheat screenings for feed and the ability of the Grain Corporation to buy the flour at whatever differential was necessary to protect the mills. But this season the markets for grain and flour and mill feeds and screenings are on a competitive basis.

Eastern millers do not pay for the preliminary cleaning of wheat. Farmers haul to elevators where the wheat is generally cleaned at so much per bushel. The farmers pay for the cleaning and take the dockage back home. If they do not pay directly, they accept a lower price for their wheat. In some cases all wheat from a district, clean or foul, is bought at the same price, and the man who delivers clean wheat to the buyer accepts a price set low enough to reimburse the buyer for cleaning his neighbors' foul wheat. The eastern mills pay for the clean wheat in any lot, subtracting the weight of dockage and the cost of taking it out and then adding the value of the dockage. It seems to us that this is all we can expect California mills to do when their products are sold in competition with those of eastern mills.

If such a system is expensive to us because we use sacks or imperfect harvesters, it is up to us to turn to more economical methods and more efficient machines.

Easier to Borrow on Warehouse Receipts

(Written for Pacific Rural Press.)

"It's easy to get plenty of money at reasonable interest on the security of warehouse receipts for grain in California," asserted a leading grain dealer and a leading warehouseman, at a hearing August 4 in San Francisco, held by R. L. Nixon of the U. S. Bureau of Markets, to discuss regulations for enforcement of the U. S. Warehouse Act. This act, according to Mr. Nixon, was designed to make it easier to get loans on warehouse receipts issued on storage of grains, wool, cotton, tobacco, or flaxseed. It provides that warehousemen who choose to accept its benefits must contract with the Government to do certain things, which make their receipts more universally dependable as security.

Here in California our warehousemen are under control of the Railroad Commission, and their receipts are of uniform wording so it is said that in general a banker knows at a glance whether such a receipt is good security and will justify making a

loan quickly on good interest terms. Our readers know how easy they have found it to get money on such receipts.

A San Francisco man died in the penitentiary not so long ago. He had operated a grain warehouse and had defrauded banks and business men out of thousands of dollars by manipulation of receipts which represented grain that wasn't there.

A Memphis, Tenn., cotton warehouseman stood high in financial circles. His probity was unquestioned. His warehouse receipts were accepted as collateral for loans in every bank in that city. One day one of his customers paid a note for \$25,000 at one of the banks. He told the banker that he did not care about the warehouse receipts which had secured the note, as the cotton had all been shipped two or three weeks ago, without the receipts. The banker, of course, called in all of his loans secured by receipts from that warehouseman, and six days later every

 Branch Sales Office at Los Angeles.

other bank in town was holding the empty sack, for the warehouseman had failed. The actual security (cotton) was all gone. Of course borrowers on such receipts had to make good for their loans, if they could, but it made the bankers leary of lending on warehouse receipts. They had to charge a higher rate of interest and go to more expense to verify such security, and so the borrowers suffered.

In California are local warehousemen who keep account of stored beans, grain, etc., in pocket memorandum books, as stated by one man at the meeting. If that is true under our present laws, we can see why a banker would have to be personally acquainted with the warehouseman whose receipts are offered before he would make a loan on them.

That is why the borrower who offers legitimate warehouse receipts as security is subjected to difficulty in getting a loan and a high rate of interest if he gets it.

U. S. Warehouse Act.

The U. S. Warehouse Act was approved August 11, 1916, but has not been enforced. The Bureau of Markets has this summer held about two dozen hearings in the big markets to discuss the regulations by which it will be enforced. The meeting at San Francisco was one of the last of these.

The law is designed to insure warehouse receipts and make them readily acceptable at distant banks. Every warehouseman who wants to enjoy its benefits must take out a license. He can't do it unless he has a good reputation, a good warehouse, and a good system of running it. He must have assets clear of all other incumbrances which will be liable for any losses encountered on receipts he issues, up to \$100,000 of such liability. If he lacks any part of that \$100,000 he must make up the difference by filing a bond acceptable to the U. S. Bureau of Markets. In addition to this, he must file a bond not less than \$5,000 nor more than 5 cents a bushel storage capacity to insure faithful performance of his contract with the government and with owners of stored products. The receipt must be of uniform wording and give such information as the banker needs.

It was conceded at the meeting, that if any warehouse concerns should take advantage of the act, it would force all of the others to come in because patrons of the warehouse would demand the most readily negotiable receipts.

STATE MASS MEETING OF FARMERS.

Dear Fellow Farmer: At a meeting of the directors of the Farm Owners' and Operators' National Association with a large number of grain growers, July 24th, the executive committee was directed to ascertain the sentiment of farmers on a proposal to hold a state-wide mass meeting in Stockton about September 1st, for the purpose of discussing the government wheat price guarantee and its results to the farmer.

Considerable sentiment against a continuation of the law, and against the regulations as they are now laid down, was apparent in the meeting. It was thought that if the farmers of the State could be brought together, the general average of sentiment could be arrived at; and the personal experiences and results to the grain growers would provide evidence on which to act.

1. Do you favor a State-wide mass meeting of farmers in Stockton about September 1st?

2. If the meeting is called will you attend and bring with you as many of your neighbors as possible?

3. Please bring this matter up at all your meetings.

4. Have you any suggestions on this or any other subject that will promote the welfare of the farmer? If so, let us have them.

5. Let us hear from you at once whether you can attend.—Farm Owners' and Operators' National Association, Albert Lindley, Chairman.

HYATT

ROLLER BEARINGS

For Bigger Crops

THERE is no reason for any letup in our big agricultural program. Conditions vouched for by the Department of Agriculture warrant a sustained production of crops for which good prices are assured.

The greatest single factor today in making possible increased crops at a lower cost of production is the farm tractor.

Hyatt Bearings in tractors and other farm machinery make it possible for a man to get greater results with less labor. In addition, Hyatt Bearings are used in such farm machinery as grain binders, threshers, plows, windmills, etc.

Western Canada's "Horn of Plenty" Offers You Health & Wealth

Western Canada for years has helped to feed the world—the same responsibility of production still rests upon her.

While high prices for Grain, Cattle and Sheep are sure to remain, price of land is much below its value.
Land capable of yielding 20 to 45 bushels of wheat to the acre can be had on easy terms at from \$15 to \$30 per acre—good grazing land at much less.

Many farms paid for from a single year's crop. Raising cattle, sheep and hogs brings equal success. The Government encourages farming and stock raising. Railway and Land Co's. offer unusual inducements to Home Seekers. Farms may be stocked by loans at moderate interest. Western Canada offers low taxation, good markets and shipping; free schools, churches and healthful climate.

For particulars as to reduced railway rates, location of land, illustrated literature, etc., apply to Supt. of Immig., Ottawa, Can., or

(Written for Pacific Rural Press.)

State School Land Auction.

Two thousand acres of State school lands in tracts of 40 to 640 acres each, in Los Angeles county, are to be auctioned off by State Surveyor General W. S. Kingsbury on the Los Angeles Court House steps at 10 a. m. August 22. A second sale will be held in the northern part of the State later to dispose of lands in that region. Other sales will be held at various places and times. A list of lands to be auctioned may be obtained from the Surveyor-General at Sacramento. Terms: cash, or 10 per cent down on date of sale and six per cent interest on the balance until paid. Most of the lands are chiefly good for grazing, timber, or mining.

Wire-worms after Clover.

After you plow up that old worn-out alfalfa or clover patch, sow it thick to mustard and then turn the mustard under while it is lush and green. Then don't replant for a few weeks. It will reduce the number of wireworms considerably for they don't like mustard and they are always numerous after an old clover field. Certain parts of Humboldt and Siskiyou counties might try this out.

Gulf Shipment of Barley Embargoed.

On account of the extraordinary shipments of barley to Gulf ports for export to Europe, the Southern Export Committee of the U. S. Railroad Administration has placed an embargo on shipments from California to the Gulf after August 1. It is feared that congestion at the ports of Texas City, Galveston, Port Arthur, New Orleans, and Mobile will handicap movement of the crops, so nothing may be moved henceforth without a permit from the committee. Permits will probably be issued freely up to a certain amount.

Are You Burning Fertilizer?

A ten-sack yield of grain may roughly average a ton of straw per acre. If this straw is spread and plowed under, it restores to the soil the following constituents as determined by many analyses:

Kind of Matter	Pounds Fertilizer Elements Per ton.			
	Pounds Dry	Nitrogen	Phosphoric Acid	Potash
Straw 100 lbs.	85.5	11.2	3.6	24
Barley	88.5	11.6	4.2	30
Oat	92.5	12.4	1.8	30.8
Rice	91.6	10	1.6	14.8
Wheat	89.5	23.4	8.4	27.2
Bean	91.4	47.6	10.8	44.6
Alfalfa				

How much would the above fertilizers in a ton of straw cost at present prices in your town? Do you burn it and waste all the nitrogen as well as much of the other elements and the humus value? Do you expect the fields to continue bearing grain indefinitely without your restoring something to them? Are you robbing your children? There are straw spreaders on the market which will make it easy to plow the straw under. But plowing shallow on light soil will not turn the straw under far enough, and thus it might injure the next crop. The world moves and you may have to change your old-time methods. Plow the straw under deeply.

If It Should Rain on the Beans.

During the fall of 1916, when there were about three weeks of rainy weather after the beans were cut, H. E. Harris, of Santa Barbara county, saved practically all of his beans by keeping four or five men busy turning the vines every time a few hours of clear weather showed up. Some of the vines were turned nine times. One man could turn 20 acres per day. Mr. Harris has, with a partner, turned 40 acres in half a day.

Knotty-Rooted Cantaloupes.

Knotty roots on cantaloupes indicate infestation with nematode worms. Some damage was done this season on the lighter soils and the earlier locations in Imperial county. But the trouble has been known several years in older cantaloupe sections of Imperial county as reported by Horticultural

Commissioner F. W. Waite, who sees no reason for alarm. Most of the damage this season was on first-year cultivation after alfalfa.

EVERYTHING MADE IN CALIFORNIA.

"Made in California" is the passport to the Home Industry League, under whose auspices the California Industries and Land Show will be held in Exposition Auditorium, San Francisco, October 4 to 19.

The Show is to include nothing but goods manufactured in California and products grown in this State. Premiums are all in the form of medals.

In the livestock department only champion animals will be shown. That agriculture and agricultural implements will occupy a large share of attention is evident from the premium list. Special premiums are offered to the county having the first display completely installed and to the one which has "the most extensive, perfect, and varied display of horticultural, agricultural, viticultural, manufactured, and other industrial products."

The management, whose avowed object is to aid in creating a demand for goods grown or manufactured in California, thereby stimulating production, seems in one respect to have been off with Rip Van Winkle lately,

for they are offering premiums for the best displays of beer, champagne, fortified wines, and dry wines.

Other premiums are offered for best displays of alfalfa, barley, seeds, oats, potatoes, sweet potatoes, dried vegetables, walnuts, almonds, collections of nuts, citrus fruits of many varieties in many packages, deciduous fruits of many kinds, grapes, raisins, dairy products, oleomargarine, etc.

Agricultural machinery receives much attention. Premiums are offered for best display of agricultural machinery, best display of land leveling machinery, plows, road machinery, automobiles, trucks, tractors, dairy machinery and equipment, electrical appliances, gas engines, pumps, sprayers, transmission machinery, etc.

There will be an education here for producers or users of these products, covering a small space but representing all of California. The premium list is just out.

BUD VARIATION IN DAHLIAS.

(Written for Pacific Rural Press by Prof. J. W. Gregg, Univ. of California.)

Now that the season for dahlias is again with us, the growers will not only be concerned with the number and quality of blooms produced, but will, in addition, endeavor in many cases to bring forth new varieties. In this connection, it might be well to call to the attention of dahlia growers in general the fact that, in the past, not all of the new creations have originated from seedlings, even though a great many people seem to assume that this has been the case. In looking back carefully over the history of

the dahlia, it is very clearly brought out that bud variation has been responsible for the origin of many of the valuable varieties. In this connection, the method of propagation, together with variation in soil, climatic conditions, and culture, have probably been the most important factors concerned in bud variation. Of course, it is generally recognized that the most common method of propagating the dahlia is by the division of the tubers. Propagation by cuttings is now a most common method employed by the majority of the larger growers in all sections of the country, and it is by this method that certain bud variations whenever they occur can be perpetuated.

Numerous case might be cited to show that bud variation in the dahlia is no new or recent phenomenon and that while growers may continue to produce new and good seedlings they should, nevertheless, be on the lookout during the growing season for bud variations, which are sure to be found in any sizeable collection and which may prove, if selected and perpetuated, most desirable acquisitions.

The new strawberry container as adopted by the Central California Strawberry Growers' Association, which will be used generally next season, has made its appearance. The old style chest will be retained, but instead of the small six-basket drawers there are eight large drawers. The berries are not "faced"; in other words, as good a quality will be found at the bottom of the baskets as are on top, which for many years has been a bad feature of the old pack.

Ralph K. Mulford, Jr., in Daddy's Car day of Race

Same tires after the race.

BRAENDER TIRES WIN AGAIN

ON RALPH MULFORD'S FRONTENAC CAR at Sheepshead Speedway, Brooklyn, N. Y., June 14, 1919.

FIRST in Thirty-Mile Race. Time, 16 min., 20 3-5 sec. Beats old record by 11 1-5 sec.

FIRST in Ten-Mile Special. Time, 5 min., 24 1-5 sec.

SECOND in First Ten-Mile Race (1-5 sec. behind the winner.) Time, 5 min. 20 2-5 sec.

Beats old record by 3 2-5 sec.

Sheepshead Speedway Records Smashed

for 10 and 30-Mile events. Average speed 110 and 112 miles per hour.

On July 4th at Tacoma, Wash.,

Ralph Mulford broke another record on Braender Tires, winning First Race, and Second in second race, and leading in third (100 mile) race up to last six laps when forced out on account of engine trouble.

It will be remembered that Braender Tires established the World's Record for Tire Endurance at Indianapolis Speedway May 30, 1913.

WADE Improved Pea and Bean Thresher

The luxuriant growth and tough vines of Western grown peas and beans require a stronger draft than has been possible heretofore. Improved and stronger construction of the WADE Blower results in a more powerful current. The larger-than-ordinary cleaning surface assures greater output, and our sacking attachment completes the machine.

WADE Controlled Air Currents

The air currents are not allowed to blow broadcast through the machine. They are controlled by our improved damper and concentrated through our own construction to do the work better and more efficiently.

Learn All About the WADE.

The construction throughout will please you; it has that "stronger than necessary" appearance that means service. Post yourself on this wonderful machine; send at once for our booklet, fully illustrated, comparing the WADE features with the old style. Prices no higher than on ordinary machines. You be the judge. Write today.

R.M. WADE & CO.
SINCE 1865

349 Hawthorne Avenue, Portland, Oregon.

Oldest and Largest Independent Implement Dealers on the Pacific Coast.

Order Rice Binders Early

A DEERING or McCORMICK rice binder takes the worry out of rice harvest time. With these machines you can be reasonably sure of cutting a full harvest, no matter what condition the crop may be in, without undue strain on men, machines, or motive power. The clean stubble of thousands of acres of rice bears eloquent witness every year to the efficiency of Deering and McCormick rice binders.

To have enough of these good machines on hand to be sure of a complete harvest, you should place your order earlier than usual this year. We have arranged, so far as we could, to meet ordinary demands on our stocks and service, but conditions are uncertain and beyond our control. We earnestly advise early ordering on your part. It is the only way to be safe.

If convenient, see your local dealer and place your order with him. If you prefer, write to the nearest address given below, and we will see that your machines are delivered at the earliest possible date. But, one way or another, let us know as soon as you can.

Pear Blight Conditions, 1919

(Written for Pacific Rural Press.)

Pear Blight has not been so virulent this year. D. F. Norton, Horticultural Commissioner of Nevada County tells us that Blight left the pear orchards alone this year. Last year it was bad for the first time in the history of the county, but was most vigorously fought. Trees on the Sacramento River are in splendid condition and have given very little trouble. Less blight than usual showed up in the San Joaquin Valley. Fred G. Stokes, Horticultural Commissioner of Lake County, said, "All of our growers have been 'Johnny-on-the-spot' with pear blight and the percentage of loss has been small. Some orchardists, new to the game, have lost an odd tree or two, but as they gain experience in blight control, they lose little."

"It is most essential to take vigorous action as soon as the blight makes its appearance and to keep it up continuously till one has the bulge on it. We do not anticipate any serious calamity from blight in Lake County from the fact that the grower shows a disposition to put up a strong fight."

"This year we have had many Spitzenberg apple trees dehorned or completely cut down (to be later dy-

namited out). Such trees, if blighted, are a distinct menace to the pear industry. Though they blossom later than the Bartlett, yet we trace cases of blight from them to the second crop pear blossoms. In fact many of us pick off the second crop blossoms of the pear to be on the safe side."

"Late in the season, when cases of blight are dried up, there is a crying demand for some tree paint to put on large limbs which would at least temporarily prevent any infection from them and possibly save them from being cut out and also save the pears. Some of our growers have experimented with various dopes, but not successfully enough to be positive of permanent results. It generally ends in having to cut out the blighted limbs."

"We have saved many trees which had blight in the trunks by lightly peeling, disinfecting and later, when dry and all traces of blight are gone, painting with a strong solution of lime-sulphur or with Bordeaux paste. There is a good even chance that such treatment will be O. K., provided the infection is noticed in time and is not too far down in the roots. Give us all the grape news you can in your paper."

New State Department of Agriculture

(Written for Pacific Rural Press.)

The new State Department of Agriculture came into being July 22, with George H. Hecke — formerly State Horticultural Commissioner — appointed as its Director. Dr. J. P. Iverson, formerly State Veterinary, remains as Chief of the Division of Animal Industry.

The two main branches of the new department will be the Division of Plant Industry and the Division of Animal Industry. Then there is the Division of Agricultural Chemistry and the Executive Staff.

The Division of Plant Industry includes in its ramifications the following offices: The Quarantine Division, the Division of Viticulture, the Division of Plant Pest Control and Rodent Control, and the Division of Standardization and Staffs. All the officers will be in close touch with distant

branches and field inspectors, and their organization has been outlined, posts and outposts set at the outset.

An agricultural survey of the entire state is being made to prevent the spread of pests to uninfested areas. Large districts have already been mapped to this end.

Included in the Division of Animal Industry are two important branches: the cattle protective board and the Dairy Division. The first is charged with the protection of breeders from theft, with the registration of cattle brands and the licensing of slaughterers, with the inspection of cattle and hides and the collection of all fees. The Dairy Division is charged with the enforcement of the dairy laws and with regulating the production and marketing of imitation milk and oleomargarine.

Almonds in the Larger Growing Sections

(Written for Pacific Rural Press.)

"The red spider showed up a good deal in some sections of Yolo County, but the majority of almond growers are spraying and have them pretty well in hand. The almond crop is all I estimated it earlier in the season — about 83 per cent," says William Gould, Horticultural Commissioner.

At Oakdale (Stanislaus Co.), A. L. Rutherford says, "The trees that have not been irrigated look badly and red spider is quite prevalent. Irrigated orchards look better with less spider, though there are some in all orchards."

In San Luis Obispo County the report is good. Tom Henry says, "The almonds are holding out very good. I have not seen any trees damaged by red spider and the damage done by grasshoppers has been over estimated. In the young orchards of the Associated, I found that many of the trees failed to grow, and the grasshoppers were blamed for it — a good excuse for a poor stand. The hop-

pers did not damage the older trees."

In Contra Costa County the crop will be 10% more than was expected, according to John Trembath, Secretary of the E. Contra Costa Co. Almond Growers' Exchange. Even at that the trees are none too flourishing and many orchards, especially around Antioch have suffered badly from red spider as well as drought and worms. These conditions are bound to affect next year's crop. The damage of tent caterpillars is still evident.

White grape juice may be successfully canned, but red juice loses its color in cans, as shown by experiments by the Viticultural Division of the University.

There are now 110 power dusting machines operating in the walnut orchards of the south. The trees are in extra fine shape this year and the crop will create a new record.

KEEP THE FIRST PICK SEPARATE.

(Written for Pacific Rural Press.)

The prune orchard looks as slick as a peeled onion since the roller or clod-masher has been passed over it in all the prune-growing sections. It makes all the difference to the pickers when the ground is smooth — to their comfort in getting around and the quickness of picking up the fruit. Also those big prunes are safer from injury when they fall on smooth ground instead of lighting on the corner of a clod. It pays to pick up that early drop clean all over the orchard before the real ripe ones begin to come. Because the first ones often lack enough sugar to cure well and show a little layer of decay under the skin that makes them look leaden colored. They take a long time to dry and ought to be dipped again; otherwise they are a menace to a good fruit if shot up with it, by starting a little mildew. Keep them by themselves till they are very thoroughly dried, anyway.

Miracle Trio On, Above, and Under Earth

(Written for Pacific Rural Press.)

A barren jackrabbit country with soil of magnificent fertility and indefinite depth is that known as the Huron plains of western Fresno County. In years of good rainfall, grain makes good crops; but last June, when the writer made a zig-zag line across it, a harvester would travel undue distances to pick out enough wheat kernels to fill a sack. There had not been enough rain, but there was a superabundance of sunshine.

Capitalized Fertility and Sunshine.

One outfit with much money and great courage saw here a chance to capitalize the unexcelled fertility and crop-growing climate of the Huron plains; and a monument to their sagacity was the luxurious oasis of golden brown grain which beautified over 8,000 acres last June. Many fields of wheat here gave reasonable promise of 20 sacks per acre. There are also four or five thousand acres of wheat on this ranch which were not harvested because they were like the rest of the country around this oasis.

Fruit Following Grain.

Astonishing also is the growth of fruit trees and grape vines two or three years old at headquarters. Its promise led the ranch operators to plant half a section last winter to figs with peach trees for fillers, a quarter section to Muscat and Thompson grapes, and a quarter section to miscellaneous deciduous fruits. More is to be planted as fast as its care can be arranged for.

Mirages and the Miracle Workers.

Why do grain and fruit spring forth from this dry, hot, barren plain with a vigor paralleling that in the best of older established regions?

As the traveler speeds over the roads of that country on a summer day he sees occasionally fantastic shapes chasing each other in thin air ahead. A train of boxcars reminds him of a string of aerial boyish spirits playing leap frog 200 feet off the earth, or a great serpent writhing in pieces among low clouds.

If the traveler knows how sticky the soil is when moistened, he becomes concerned at the sight of his road ahead dipping into water which covers the fields also. If he is dry, he may need that water; but presto! it is gone and the road stretches dry for miles ahead.

But mirages above and on the earth are not the miracle performers which have brought into being that expanse of tall, heavy, red-brown wheat which carpets the country as far as he can see in every direction. It is water from under the earth that has performed this miracle—water that has risen vertically over a third of a mile from the depths of earth to soak the surface of many acres two or three feet downward.

Thirty-five wells a half mile to a mile apart and 1700 to 2200 feet deep are filled with water which rises by its own pressure within 100 feet from the wheat roots.

Great electric motors and centrifugal pumps lift it to the surface, whence it is distributed through something like 100 miles of big underground pipes to irrigate a total of 15,000 acres whenever irrigation seems needed. Even after the past three dry seasons the water table has not gone down greatly.

The first group of these wells were put into operation in the fall of 1917. Much of the present season's grain is on land irrigated after the plowing, disked after irrigating, and drilled after diskings. With such treatment 45 pounds of seed per acre made almost too thick a stand.

Spring Irrigation Saved Crop.

Certain fields planted in the fall of 1917 without water were irrigated the following April, but for some reason the results were not worth the cost. Last fall other fields were planted without preliminary irrigation and the previous spring's experience led to neglect of irrigation last April.

This neglect cost the operators thousands of dollars, as was shown by at least one field not irrigated until April, 1919. That field made about ten sacks of wheat per acre, while the neglected fields scarce returned their seed if indeed they were harvested at all.

Motor-driven pumps have here made a crop worth \$60 per acre on land just like that nearby which did not pay for harvesting. The \$60 crop has cost not a great deal more to produce than the absolute failure, except for harvesting. Pump irrigation has multiplied the value of the land, but that is only the beginning. The grain development is only a preliminary crop to make the project pay until it shall have all been planted to fruit, which will again multiply the

value of the land. Who would quarrel with such use of capital? Who would not congratulate its owners on their vision of rural development and mayhap of the eventual building of many rural homes?

LIFE OF POWER HAY BALER.

The average life of a power hay press in an alfalfa hay district of the South, investigated by the U. S.

A common scene these days in California country towns consists of the heavy wagon trains hauled by tractors bringing new grain to warehouses. Two men haul easily sixteen tons per load.

"Send Up the Holts"

In the retreat from the Somme in 1918, the "Caterpillar" Tractors saved the British heavy artillery.

All along the line in the shelter of trees and ravines they were waiting the word "Send up the Holts"—to save the big guns that meant so much.

For 24 hours at a stretch the "Caterpillar" Tractors pulled 18-ton guns along almost impossible roads, seeking the new positions where the German hordes could be held.

And the "Caterpillar" Tractors stayed on the job. At a time when a breakdown or delay would have spelled disaster they kept going, with motors cool and efficient—with track-parts, gears and shafts unhurt by the terrific strain. Holt design, materials and workmanship had proved sound.

This performance was repeated times without number during the War. What the "Caterpillar" Tractors did is history. The "Caterpillar" Tractor built only by Holt, or under Holt contracts and patents, was the *only* tractor of track-type used by the Allies for their hardest war service—chosen after prolonged and severe tests.

This War record proves conclusively that no work on farm, road or forest is too severe for the "Caterpillar" Tractor to handle with ease, with downright economy of operation, and absolute dependability. Buy your "Caterpillar" Tractor now. Send for Catalog 404.

Department of Agriculture, was 12½ years, in which it baled 7,500 tons of hay, working 41 days per year. Repairs, depreciation, and interest on investment amounted to 15 cents per ton. This was higher than necessary, due to inexperience and carelessness of the operators.

SINK TEST-WELL IN DOUBTFUL CASES.

Many a man has dropped a thousand dollars in a hole in the ground. The hole was intended for a well, but it never struck water. The advice of one such sufferer is to hire a test-well rig to put down a hole of minimum workable diameter at minimum expense. If a good flow is found, ream out the hole to the size desired for a well. Such a test-well costs about \$1.50 per foot for the first thousand feet.

POWER NOTES.

The San Francisco branch of the Mohawk Rubber Co. has found it necessary to practically double its facilities.

No reduction in prices of Rumely Oil Pull tractors will be made in the near future. At the beginning of the year Rumely prices were fixed on the basis of current wages and costs of material. Material costs are as high as ever and are likely to continue that way. Wages are higher and are likely to go up. Therefore the machinery prices cannot be marked down.

Improved pea and bean threshers having greater power and cleaning capacity have been put on the market by R. M. Wade & Co., after giving them a season of commercial use in various bean fields of the West.

John N. Willys, president of the Willys-Overland Co., The Moline Plow Works, and other interests, is to manufacture an electric lighting and power plant for farm use. The plant will operate household electric appliances and is said to run six hours on a gallon of kerosene. It is operated by a Knight sleeve-valve engine, such as is used on the automobiles in which Mr. Willys is interested.

It is quite a job to sew in new transparent sheeting for windows on automobile curtains. An easier way is to cut the inside row of stitches and then cut out the broken window so that about one-half-inch width of the old window is left all around. On this you can stick a new sheet with pyroxylin cement, which is made of the same materials as the window itself.

NAIL-HOOKS FOR TREE-WIRING.

To the Editor: I have read many useful articles in the Press that were of benefit to me, and I will send you a sample of a device that is proving useful in young orchards and light limbs of trees too small to prop or staple. I have wired up twenty-five acres of heavily loaded seven-year-old trees and it appears to be a success.

The sample shows that I use a 20-penny or 30-penny wire nail, turning the pointed end into a hook an inch and a half in diameter and using the head to attach the ends of a piece of No. 13 galvanized wire—making one turn of the wire just below the head. These wires run, of course, through the tree from one nail-hook to another, hooking around opposite branches which thus mutually support each other, as is common in wiring up branches.

Wire nail-hooks and wires are very easy to make at the rate of 150 to 200 per hour.

W. L. EDWARDS.

San Jose.

A Bad Error.

"We had to stop our little girl answering the front door calls."

"Why?"

"The other day when Ensign Jones came to call on our eldest daughter he was dressed in his white uniform, and when the little one opened the door and saw him she immediately called upstairs: 'Ma, how much bread do you want today?'"

"You shouldn't cry over spilt milk."
"My friend, that remark originated when milk wasn't ten cents a pint."

We Guarantee the Beams not to Bend or Break

-And There's no Time Limit to This Guarantee

WHEN you buy a John Deere Tractor Plow you get full protection against beams bending or breaking throughout the long life of the plow. You are protected by the material in the beams—extra strong, special John Deere steel. You are protected by the simple, binding guarantee of the maker of John Deere Plows. That is one of the many special reasons why you should choose a

JOHN DEERE TRACTOR PLOW

Remember—

Genuine John Deere Bottoms—the kind you get when you buy a John Deere Tractor Plow—have a world-wide reputation for good seed beds, good scouring and long wear.

John Deere Quick Detachable Shares—the kind you get when you buy a John Deere Tractor Plow—wear exceptionally well and are easy to keep close-fitting. Loosen one nut to remove the share; tighten the same nut and the share is on tight.

Sizes—

Two-Bottom
Three-Bottom
Four-Bottom

Remember, a tractor plow in operation is subject to hard strains. The tractor does not "give," as horses do. If a beam springs, the plow will no longer do good work. That means a costly delay while the beam is being repaired. If a beam breaks there is a costly delay and the expense of a new beam besides.

The extra strong, guaranteed John Deere beams protect you against delay and expense.

Be sure to consider that important feature when you choose your tractor plow. And keep in mind these other features:

The extra strong beam braces are long lapped and securely joined to the beams with heavy bolts and lock washers. The frame stays rigid. The bottoms keep their proper alignment.

The simple, strong, positive power lift is trouble proof. It doesn't gather trash. Its few parts move only when the bottoms are being raised. There is practically no wear.

In every way you will find that the John Deere Tractor Plow has the downright quality to enable it to keep on doing the best of work year after year with fewest repairs.

You can hitch this plow to any standard tractor. Your John Deere dealer can furnish it to you in two, three or four bottom sizes. You can get it equipped with the type of genuine John Deere bottoms especially adapted to meet your requirements. See your John Deere dealer the first time you are in your town. Write to us for a folder. Ask for folder TP-1 25

Official Records for Grade Cows.

(Written for Pacific Rural Press.)

At last we are to have a "Who's Who" for grade dairy cows. The cow testing associations are doing a world of good, but they don't go quite far enough. They enable a dairyman to know what his cows are producing, but they don't offer any special inducements for him to give his cows high records; neither do they give good records sufficient publicity when they are made. The lights are kept under a bushel. But now these lights will be taken to the top of the hill, and the bushel will be removed so that all dairymen may know about them.

Recently the University of California has been sending out monthly reports from the different cow testing associations, listing all cows making 50 pounds or more of fat during the month. These reports have created considerable interest, but in this way recognition is liable to be misplaced, for the cow that makes the 50-pound list once does not always make good at yearly production.

So the University has arranged to establish an aristocracy among grade dairy cows based upon yearly production—or rather for 10 months, as 2 months of the year are allowed for a cow to be dry. This will be done through a Record of Production. It is not an untried plan, as it has been in operation in Wisconsin since April, 1918. The results have been so satisfactory that California will now fall in line.

The Record of Production stimulates friendly rivalry and pride among the members of all the different cow testing associations by letting their neighbors and their fellow dairymen throughout the state know how their cows rank in yearly production. It advertises their stock, and when a buyer wants cows of proven worth he has reliable records to refer to. The greatest asset of each of the different breeds of registered cattle today is the great mass of official records on its books. These records not only furnish a basis for prices, but are of fundamental importance in selection for constructive breeding.

The new Record of Production will work out the same in connection with grade herds. Too long have grade cows sold according to looks. Too long have heifer calves for future dairy cows been selected on the same basis. Prices should be established according to performance; calves should be retained according to breeding. And the Record of Production will bring these changes about.

The rules and regulations just issued by Prof. Clarence V. Castle, of the University Farm, are as follows:

Rules and Regulations.

1. The work of collecting the records and issuing the certificates to be done by the University of California in co-operation with the various cow-testing associations, nothing herein saying that other methods may not be also approved.

2. The University of California to have absolute authority in questions as to eligibility of cows, authenticity of records, etc.

3. A fee of \$1 to be paid upon application for entry of any cow, to cover cost of supervision, forms and certificates.

4. On completion of a 10-month record period the University of California will issue a certificate of record of production for cows that have qualified for the record.

Keeping of Records.

1. The herd records as compiled by the various cow-testing associations are to be accepted as authentic and correct, but the University of California is to be the final judge in all questions arising.

2. Any certificate secured by fraud or misrepresentation to be cancelled if the evidence warrants.

3. The cow-tester or owner of cow to send in to University Farm, upon application, a detailed description of the cow, upon blanks supplied for

this purpose by the University of California.

4. At each monthly test the tester or owner of the cow shall mail to the University Farm a report of the milk production and fat test of the cow for the testing day, on a blank form furnished by the University of California.

5. At the end of a lactation period of 10 months a summary is to be sent to the University Farm on blanks provided for that purpose, of the production of the cow, which will be compared to the monthly reports already sent in.

Eligibility of Cows.

1. Until January 1, 1922, cows may be eligible that are of either grade or "scrub" breeding. After January 1, 1922, only cows that have been sired by a registered dairy bull will be accepted.

2. To qualify for a certificate, cows with first calf and under three years of age at time of freshening must produce in ten consecutive months a minimum of 300 lbs. of butterfat.

3. Cows with second calf or more must produce a minimum of 350 lbs. of butterfat in ten consecutive months.

4. In addition to the fat production, a cow to qualify for the certificate must carry a calf at least five months of the ten-month period.

5. Any cow that is known to have tuberculosis will not be allowed to

qualify for a certificate.

6. To be allowed to continue the test, any cow in normal condition must produce a minimum of 30 lbs. of fat for cows with first calves, and 40 lbs. of fat, for older cows, during the first month of the test.

7. The owner of cows to be entered shall agree not to use or dispose of their male offspring for breeding purposes.

ANOTHER BELKNAP SALE.

Those who remember the quality of stock offered at the Jersey Queen Farm sale a few months ago will know what to expect at the sale scheduled for Tuesday, August 19th, at the Garden City Sanitarium, San Jose. Dr. Belknap will offer 27 head of choice registered Durocs—bred and open gilts, bred sows and weaned pigs. All bred stuff in pig to the \$1,500 boar. Eight Shropshire sheep, eight lambs, and an imported Buttar ewe with lamb will also be offered. Col. Ord. L. Leachman will cry the sale. Better plan to attend.

CARRUTHERS OFFERS DIAMONDS IN THE ROUGH.

Go around the state where the best Berkshires are to be found, and ask where the foundation stock was secured. In most cases the answer will be "From Carruthers Farm." Ask about the outstanding individ-

uals in the herds, and a similar answer will be given.

The same kind of stock will be offered at Mr. Carruthers' sale at Live Oak, August 23, only nearly everything will be young and not fitted. But that's all the better. You can buy the animals cheap, and by growing them out yourself you will treble your money in a year. Some wonderful stuff will be offered. Don't miss this sale. Col. Ord L. Leachman will be the auctioneer.

The problem of soft pork is now one of the most important confronting hog growers, according to the Department of Agriculture. The matter is considered so serious that Congress has appropriated \$20,000 to be used for a study of the question. Agricultural experiment stations will co-operate.

A general campaign to increase the number of small flocks of sheep isn't very wise, according to Dr. J. R. Mohler, of the Bureau of Animal Industry, unless the field for such an effort is first prepared and capable shepherds are developed. He says that farmers in general are not versatile enough to add a profitable flock of sheep to their present livestock.

California Breeders have sold more than **\$350,000.00** worth of registered cattle in our sales, under the most stringent requirements laid down by any sales organization in America. Satisfied buyers have been the rule in all our sales. **CALIFORNIA BREEDERS SALES AND PEDIGREE CO.** C. L. HUGHES, Sales Manager, Sacramento, Cal.

GUERNSEY DISPERSAL SALE

Greatest opportunity ever offered Coast breeders to secure foundation stock of this wonderful breed, noted for the most economical production of milk and butterfat, as well as the best flavored and highest natural colored products.

Heretofore most of the animals in our herd have been held above price, but now, because of the rapid increase of our business along other lines, we are compelled to disperse this entire Guernsey herd, which we believe cannot be surpassed anywhere in uniformity of type, health, breeding and production.

100 Head at Private Treaty

Everything goes; not an animal reserved. There are 83 females of great production and promise; 17 males that are real herd headers. Twenty-one of the cows have Advanced Registry—official yearly records of from 500 to 800 pounds butterfat, and several more are now on test.

If you want show quality as well as heavy production, you will find them here. The herd includes the grand champion cow and the junior champion bull at the last San Francisco Show, and many young animals fit to win in the hottest competition.

FEMALES OF GREAT PROMISE

While a good share of the mature females have been given records, they have not been forced, and there is not a cow in the herd that has shown her limit of production. Also many of the untested cows give promise of making even better records than the ones already tested.

BULLS FOR BREEDING UP

Guernsey bulls quickly build up grade herds. They are so prepotent that they stamp the breed characteristics upon their offspring to a marked degree, and soon you have profitable producers of quality products. We offer some royally bred young bulls that will quickly double the profits from your herd.

Your Opportunity—Act Quickly

The sales list is completed and we are ready to sell. Breeders know how difficult it has been to secure good Guernsey stock, and will jump at this chance. Don't put the matter off. If you want foundation stock for a registered herd, new blood for an established herd, exhibition stock for the fall shows, or a bull to breed up a grade herd, come at once and make your selection. If you can't call, write your wants fully. But don't delay.

Write for Price List. DO IT TODAY.

Beware of Fraudulent Cattle Buyers

The California Cattle Protection Board has received several communications from cattlemen in different parts of the state with reference to the operations of irresponsible buyers. These men make their headquarters in Oakland and seem to co-operate with each other in defrauding cattle owners.

A report from Butte county states that one of these buyers purchased cattle, and when remitting deducted the amount due on one of the animals, claiming that it had been rejected by the Meat Inspector of Alameda County. Investigation showed that no such animal had been condemned.

In Humboldt County, this same buyer purchased \$5,036 worth of cattle, giving a sight draft for the amount. The draft was returned, there being no money in the bank to the credit of the buyer. The parties selling the cattle are endeavoring to get payment, as the cattle have been slaughtered and disposed of. This buyer claims to represent a responsible firm.

The cattlemen verified the financial standing of the slaughtering firm, but did not verify the statement made by the buyer that he represented the firm, who repudiated having given the buyer any authority to use their name when purchasing cattle.

A case was reported from Contra Costa County and another from Monterey County. Many reports are received with reference to the refusal of these men to pay for all the cattle purchased, claiming that one or more have been condemned by the meat inspectors. These claims are in many cases fraudulent.

Jas. B. Newsom, executive officer of the Cattle Protection Board, suggests that cattlemen insist upon payment of cattle in full at time of delivery, when selling to a buyer not properly vouched for, and that they insist that the original certificate of condemnation, properly vised, be forwarded them when claims are made for deduction for cattle sold and afterward condemned by meat inspectors.

Butte City Ranch Sale a Success

An all-day sale sometimes becomes a tiresome affair, but a good variety of good stock kept up interest to the finish of the Butte City Ranch sale, held August 2 at Butte City, and satisfactory prices were obtained.

The Berkshire offering was really a pig sale, as it consisted of young stuff of from January to May farrow. Forty pigs averaged a trifle under \$40 per head. The older pigs were grown out nicely and brought correspondingly good prices.

The Shorthorn sale was a brisk one, with Chas. F. Silva of Sacramento, the heaviest buyer, and the Jackson County Livestock Association of Medford, Ore., a close second. The latter bought the top of the sale—the cow Clover Leaflet with heifer calf at foot, the price being \$800. Four cows with calves at foot averaged \$565; 21 aged

cows averaged \$343; 11 heifer calves averaged \$265, and 10 bull calves averaged \$214. The cattle throughout were in nice breeding condition.

The registered Shropshire sheep sold exceptionally well. They were put up in small lots and 99 head averaged \$50.70. They will furnish foundations for several new flocks.

The Shetland ponies proved a drawing card for children and 9 head, including several unbroken colts, sold for an average of \$94.

Altogether, this rather unique sale was a success from the viewpoints of both buyers and sellers. The attendance was large, and among the prominent men at the ringside were Frank Brown, the Shorthorn field man of Carleton, Ore., Senator Frank W. Leavitt of the Packer Bend Ranch, and Prof. J. I. Thompson of the University Farm.

Does Sorghum Dry Up Cows?

Many dairymen have the idea that sorghum will dry up cows. It is the belief of some that the heads and grain cause the decline in milk flow; others lay it to the stalks. At the Kentucky Experiment Station tests were made to settle this question. One lot of cows was fed heads; another lot was fed stalks, and another lot was fed on corn stover, instead of sorghum. Of course, all of the cows declined somewhat in production as the test continued, but it was found that those fed the sorghum heads and sorghum stalks did not decline any more rapidly than those fed stover.

The explanation of the belief that sorghum dries up cows is that it is usually fed in the fall when succulent grass is substituted for green feed that has been available. Often the cows are expected to subsist on sorghum alone at a time when the weather is getting cold and wet. The feeder expects that the seed of the

sorghum heads will furnish a great deal of nutriment, but as a matter of fact, these little seeds are largely indigestible and pass out freely with the solid manure. Also sorghum carries less seed than is commonly supposed, for it was found that 20 pounds of sorghum stalks carried only 5 pounds of heads, which shelled out only 3 pounds of grain—a mighty small amount for a cow per day when a large part of the seed escapes digestion.

The result of this test shows that the belief that sorghum dries up cows is without foundation, and that dairymen will be safe in feeding this cheap roughage freely.

More drainage and less irrigation is proposed by Manager Ernest Behr of the Spalding Ranch Co., in opposing organization of the Glenn-Colusa Irrigation District to buy the West Side Canal for \$1,000,000.

Large Production and Fine Type

are combined in the get of
**PRINCE RIVERSIDE
WALKER**

Aaggie Acme of Riverside 2nd and Miss Valley Mead De Kol Walker, his two sisters, made the highest official yearly butter record and the highest butter record for three-year-olds, respectively, for 1917-18. His get won first prize at Sacramento last year. We are breeding his daughters to

King Korndyke Pontiac 20th, our young \$6,500 sire, whose great individuality, fine type, and backing of an unbroken line of great

producing dams are hard to beat. Come and see the result of this breeding, or write us for further particulars.

Imperial Valley raises and feeds about 175,000 sheep annually, according to E. E. Allen, manager of the

British-American Mercantile Company of Holtville. He says that when irrigation plans mature the valley will produce twice that number.

How to Ship a Hog with Safety

(Written for Pacific Rural Press.)

It requires experience to determine the proper way to crate a hog to carry him through in good shape. You often hear of an animal reaching his destination in bad condition—generally from lameness.

Make the crate to fit the hog. Do not have it too long with extra space at the ends, especially when shipping a male pig, as in loading and unloading he is liable to be injured as a breeder by slipping back and forth.

Have the crate wide enough so that a pig can lie down on his side. While it is well to consider ways to save expressage, yet the crate should be strong enough to protect the animal so as not to cause a loss by accident and injury. There should be four boards on each side and they should be close enough at the bottom to prevent a leg from slipping out and becoming injured when the pig is lying down. A three-board crate may hold a pig, but it is liable to get its front leg over a board and hurt its shoulder.

Have two boards for the back end of the crate, upright with its corners taken off, and leave them about 4 or 5 inches apart so that a male will

not be hurt in pushing back against them. For the bottom use boards 1 inch thick, leaving them one-fourth inch apart so as to allow drainage.

For shipping any distance always pad the bottom of the crate. Slipping on the crate floor is responsible for most of the injuries in shipment, and a good foothold should be provided. Nail some kind of strong sack or burlap to the floor of the crate with a little straw underneath. Coarse straw is better than fine chaff, as it will not absorb the water so much.

If the hog is going a long distance a self-feeder should be put in one end and feed in a sack should be tied on the outside of the crate. It is well to send a small tin pan along tied to a wire, so that the express man will have something with which to water the hog that will go between the slats of the crate.

The veteran breeders and shippers understand all these matters, but young breeders who have no practical experience are starting in every year, and if they will carry out these instructions many losses will be averted.

Serum Treatment for Pig Scours

(Written for Pacific Rural Press.)

In a recent issue of an eastern swine magazine, a breeder told of his success in using for white scours in suckling pigs the serum which is put out for white scours in calves. He was visiting a neighbor and saw this neighbor with a hypodermic syringe in his hand coming away from a cow that had just dropped a calf. He asked what was being done and was told that white scours had been prevalent on the farm and that all calves were being vaccinated at birth. The thought came to him that if scours in calves could be prevented by the use of a serum, why could he not vaccinate his pigs? He had been having trouble with white scours in his pigs, and the disease had seemed to go right through his herd. So he tried the serum treatment, using a 5 c. c. dose, injecting it in the loose skin back of the foreleg. He found that the serum was both a cure and a pre-

ventative, and now he vaccinates all pigs right after they are farrowed. He says that the cost is about 15 cents per pig.

Having received inquiries from several California swine breeders who were having trouble with white scours this spring, we took the matter up with Dr. F. W. Wood, veterinary director of the Cutter Laboratories at Berkeley, and he states that their serum will prove quite effective, both for preventing and for treating white scours in pigs. He says that 5 c. c. would be sufficient as a preventative for suckling pigs, but he recommends from 15 to 20 c. c. when used as a cure. Serum given as a preventative has protected the pigs from two to three weeks, which is about all that is necessary, as it is generally during the first ten days or two weeks after birth that intestinal infections are most serious.

Bleakmore's Novel Selling Plan

(Written for Pacific Rural Press.)

"Have you a good reputation for square and honest dealing? If so, come and get a fine bred Chester white gilt without planking down a blooming cent."

That's the way Lee Bleakmore, owner of Oak Knoll Farm at Lakeport, talks to the farmers of Lake County. Mr. Bleakmore has the largest herd of Chester Whites on the Pacific Coast, headed by the \$1,000 grand champion boar Highlander. He believes that the Chester White is the best farmer's hog on earth; he wants to see Chester Whites on every farm in Lake County; and he is willing to place an animal on each farm and leave it there without pay until it has proved its real worth.

His plan is this: Any responsible farmer can go to the ranch and pick out a bred gilt from the several hundred on hand. A price is set on her at the time, but nothing is paid down. The farmer takes the gilt home, and

when she farrows he notifies Mr. Bleakmore's superintendent, who goes there and checks up the pigs. Then when the pigs are sixty days old the farmer decides whether or not he wants to keep the gilt. He can determine by this time what kind of a mother she is and what kind of pigs she has. If he decides to keep her he pays the price agreed upon, plus one-half the litter. If he does not want her he simply returns her with one-half the litter, and is allowed to keep the other half for his trouble. If the sow dies on his hands, he is relieved from all obligations.

We have heard of many different hog promotion plans, but none more fair to the buyer. This offer certainly proves Mr. Bleakmore's faith in his stock, and also shows his confidence in the ability of his gilts to make good on the average farm. We shall expect to soon see Lake County become famous for both the quantity and quality of its Chester Whites.

GREENWOOD DUROCS

Mail orders for good Durocs may be safely trusted to our care. Our business is picking good ones, and we will select a good one for you. If not satisfactory, your purchase may be returned. Some choice spring boars for immediate delivery.

DUROC GILTS

Orion, Long Wonder and Volunteer Breeding.

Also young pigs by a son of Johnson's Defender. For prices and particulars write GUY H. MILLER, Modesto, Calif.

DUROC JERSEY BOARS

Rancho Del Sur offers 15 good fall boars sired by Orion's King Gano and California Orion Cherry King. I guarantee these boars to please you. Those bought on mail order may be returned if not satisfactory.

DONALD H. GRAHAM, Lancaster, Cal.

use calco troughs -

If hogs could respect anything, they would respect Calco Hog Troughs, as their owners do.

These Troughs are built for the practical farmer—to help him raise healthy hogs. They are constructed of Armeo Guaranteed Galvanized Iron and Cast Iron—strong, durable and serviceable.

A feature of the Calco Trough is its sanitation. No cracks or seams to catch disease germs; it may be readily cleaned or drained—its smooth metal interior may be quickly washed.

Write for the Calco Hog Trough Price list, showing lengths from 24 to 120 inches. Put your hogs on this trough—it will pay you.

THE GARDINER RANCH
ROUTE 4, BOX 735. SACRAMENTO, CAL.

Along the California Livestock Trail

(Written for Pacific Rural Press by Thos. F. McConnell.)

Ireland Durocs.

One naturally associates green color with the word Ireland, and certainly beautiful green fields are found at the Ireland Ranch in the San Fernando Valley near Owensmouth. The Duroc-Jersey hogs are just as beautiful as the fields, even to the mammoth boar, Cherry Volunteer 2nd, standing 40 inches high and as good as he is tall. He is by Cherry Chief 2nd and out of Volunteer's Defender Lady.

The junior herd sire is Ireland's Joe Orion, sired by Joe's Orion Cherry King 4th. He is the boar that Fred Devore tried to take back East and for which he offered Ireland Ranch \$2,000. He would be a candidate for high honors at any show in the world. The females in this herd are a wonderful lot—just as good as the males.

Shorthorns at San Julian.

Here I found a wonderful place and some wonderful Shorthorns. I arrived just as the matrons were brought in from pasture and the sight was worth going miles to see.

Hallwood Flash, the senior herd sire, is a great individual, very hard to fault in any way. He is a most excellent sire, as can be seen in the number of show calves in the barn. Such youngsters as Baron Lancaster, Lucy Lee 5th, Theresa Orange Blossom and many others speak louder than words as to this bull's value as a sire. The white senior yearling bull, Bashan Augusta, is a wonderful youngster any way you look at him, and will be near the top wherever shown, if he keeps coming.

The females of the herd are in the same class with the males. Theresa, a large roan cow, has a great calf in Theresa Orange Blossom sired by Hallwood Flash. The calf has excellent lines, very long and close to the ground. Imp. Eliza 15th, the cow that dodged the submarines, has a beautiful calf by Edgemoor Broadhooks that will be heard from in the show ring. There are several heifers sired by Scotch Cumberland that certainly give a lover of Shorthorns an "eye-full." Meadow View Village Girl is a roan that is well covered and withal a very sweet one.

Mr. Ernest Reynolds, the herdsman, has the stock in fine shape, and will have them "on edge" by fair time.

Edgemoor Quality Guernseys.

Just at the edge of the moor, beyond the village of Santee in San Diego County, is found the greatest establishment for the breeding of Guernsey cattle and the production of certified milk to be found on the Pacific Coast, if not in the entire world. Six years ago it was just an ordinary ranch, but now there is building after building and barn after barn, until one becomes almost dizzy thinking of what has been done in such a short time.

The buildings are artistically designed, yet with a view to economy. They are of concrete construction, equipped with the latest devices, and when we take into consideration that

the highest bacterial count of a sample of the milk in a year was 8,000 per cubic centimeter 48 hours after milking, and that the general count is only 200 to 300 in comparison to 25,000 to 75,000 for grade A milk, then we begin to realize that such buildings and equipment are necessary and pay.

Last year Mr. Dupee sold 4 bull calves to 4 farmers in Waukesha County, Wisconsin. They clubbed together and entered the calves in the "Get of Sire" class at the State Fair and won first in the great show of Guernsey cattle. These calves were sired by Itchen May King, one of the greatest sires of the breed. He is a wonderful animal and has an excellent disposition. Of the other herd sires Royal Rose King and Pecoyd's Golden May Secret are second only to the senior herd sire.

Renwick's Rooters.

Just west of Santa Barbara is found one of the blue ribbon herds of Poland-Chinas in California. There are many large herds, but no better ones. Mrs. Viola L. Renwick, the owner, started in the swine raising business with just hogs, and, according to her own story, they were hogs to eat, not to grow, so she got out of that kind as quickly as she could. The head of her herd is El Profito, a two-year-old boar that is a great hog any way you look at him. He is very active and straight on his feet, and one of the very few boars that is large without being coarse. Some wonderful stories are told by the Italians that come to buy pigs sired by El Profito, about the gains they make. Just a sight of this boar will sell all the pigs that Mrs. Renwick can spare.

Defender's Long Maid is one of the profitable females of the herd, as she has farrowed four litters of 11, 12, 12, and 8 in number respectively, and of the kind that sell easily. In fact all of Mrs. Renwick's are of this kind and there are no boarders in the herd.

Pigs in Cloverdale.

Most of the former Whitten Ranch herd of big type Poland-Chinas is to be found at the beautiful Cloverdale Ranch among the hills of Escondido. Here the hogs are kept under different conditions from those prevailing on most ranches. The ranch consists of 1,100 acres, of which half is tilable land, situated in the upper end of a little valley. After the barley and wheat are harvested the hogs range and pick up all the waste grain that otherwise would be lost. Therefore, hogs at Cloverdale have plenty of exercise and feed. Consequently, they are not pampered, but are kept in excellent health and prove prolific breeders.

Jumbo Model, the \$1,000 senior herd sire, is a great hog. He is an active fellow with good bone, right up on his feet, has a stylish head with back and hams that are hard to beat. He weighed 811 pounds when two years old.

Always keep a mixture of charcoal, wood ashes, lime, sulphur, salt and coppers before the hogs. It is an insurance that pays well.

GET IN THE GAME

This is the time to get started with registered hogs, or to increase your herd if you are already raising them. Never before have the opportunities been so great or the prospects so bright.

BUY BERKSHIRES

Get the right breed. This means the Berkshire—the pork-maker's ideal. He produces the greatest amount of the highest quality of meat, at the earliest age and the lowest cost.

65 Head at Auction

This is your opportunity to get young stock from the herd that holds the coast record for the two top sales of Berkshires. All of our young stock will be offered. Nothing reserved. Many prospective prize-winners among them.

The females will include 12 under-one-year sows, and a junior yearling and a senior yearling good enough to win anywhere. Also 20 young sows 4 to 7 months old.

The boars will include 10 topky youngsters, 4 to 7 months old, that will make great herd headers for registered herds. Also 20 good young stock boars for grade herds.

SPECIAL ATTRACTIONS: Live Oak Champion, reserve grand champion of 1918, being defeated only by his sire. He is a two-year-old, out of one of the greatest daughters of Rival's Champion's Best. Also will sell the two-year-old Mayfield Superbus, by Superbus and out of one of Corsa's best sows.

Saturday, August 23rd

Sale will be held at the farm, three miles west of Live Oak, Sutter County, starting at 1 o'clock. Be sure to attend. You can't afford to miss this farmer's sale where high-class stock will go for moderate prices. Send for catalog.

Livestock and Dairy Notes

Livestock breeders all over the state are invited to send on postal cards, notes regarding their sales, State and County Fair intentions, new stock, etc.

Beef Cattle.

Several carloads of beef cattle have been shipped from San Ramon Valley to Chicago within the past few days.

The Pacific Coast Hereford Breeders' Association, will hold a meeting at Sacramento during the State Fair week to complete plans for the big sale to be held at the San Francisco Livestock Show.

Thousands of cattle are said to be starving or dying of thirst in the Black Butte district of northeastern Los Angeles County. It is said all of the streams and springs in that section have dried up due to lack of late rains, and the condition is serious. Similar trouble is reported from sections of Kern County.

Lady Ruberta, the prize-winning white Shorthorn heifer, reported sold at the Carruthers' sale to an Idaho firm, has been purchased by Senator Benj. F. Rush of Suisun, who has picked up quite a number of the good ones at recent sales. The Idaho parties failed to make satisfactory settlement.

The Dairy.

Toyon Farms, Los Altos, purchased a carload of Holsteins at the Pomeroy Son sale at Scappoose, Oregon, last week.

State dairy inspectors are waging a campaign against unsanitary dairies in Tulare County, and a number of prosecutions have resulted.

F. H. Van Derpool, Riverside, has a Jersey that has produced 2100 pounds of butterfat in three years on alfalfa, corn silage and beet pulp and only milked twice a day.

An offer of \$3,000 for the calf of Raphaella Johanna Aaggie has been refused by the Napa State Farm. It is expected that the calf will be exhibited at the State Fair.

Jas. J. Jeffries of Burbank reports that Canary Pietertje Segis has made a record of 27.15 pounds butter in 7 days, and Gerben Canary Belle Segis a 4-year-old, record of 26.14 pounds.

Fred Hartsook of Lankershim is proud of a record made by the senior 2-year-old heifer, Miss Gelsche Walker of 31.80 pounds butter in 7 days. That puts her among the top ones.

It is reported by wire that the 12-year-old Jersey bull Gamboge sold for \$65,000 at an auction held at the farm of Edmund Butler, Mount Kisco, New York, last Monday. The purchaser was L. K. Walkley of Southington, Conn.

Dean H. E. Van Norman of the University Farm says that as a result of the different drives for better stock poor cows will be weeded out faster than good ones can replace them. Production will not keep pace with consumption and the prospects are bright for the dairyman who has a carefully selected herd.

Madrigal Mookie 2nd, owned by W. J. Higdon of Tulare, has just completed a 60-day record of 213.65 pounds butter from 5,000.22 pounds milk, with a 7-day record of 32.66 pounds butter. Last year this cow broke the state milk production record for two-year-olds, and her record this year shows 34 pounds more butter and 900 pounds more milk in 60 days.

Ed. H. Webster of El Centro says that milking machines did not give entire satisfaction down in the Imperial Valley, as considerable garget resulted. Several outfits were thrown out, but the milking machine seems the only solution of the help problem, and dairymen are beginning to use them again. The dairymen find that the trouble is generally with the operator and not with the machine itself.

Swine and Swinemen.

H. C. Shinn of Tulare has sold a young Poland-China boar pig by Boulder Buster, out of Bob's Giantess, to I. G. McCune of Stratford.

H. Braly of Conejo Ranch, Newberry Park, has left for the middle west to purchase more Hampshire and Duroc hogs. Conejo Ranch will exhibit at all fall shows.

A. J. Elliott of Tulare has sold a boar pigs from his \$325 sow, Big Ann, to a prominent Poland-China breeder in Glasgow, Kentucky. Sure, they have to come to California.

W. A. Young of Lodi has sold to Norman F. Eastman of New York City 10 Poland-China sows and gilts for \$2,500. They will go to Eastman's ranch at San Fernando.

W. J. Stewart, Tulare, has sold a fine young Duroc-Jersey gilt to W. H. Bittner of Bakersfield. This gilt was the prize winner at the last contest of the Visalia Boys' Pig Club.

California Berkshire business is booming, according to the records of the American Berkshire Association, which show that for the month of July California stood second in the number of transfers recorded.

The Popular Farm Bureau Center has a pig club of 16 members. Each member has purchased a pure-bred gilt, and a litter contest will be conducted.

ducted. H. C. Carr, of the First National Bank of Porterville, is the pig club leader.

W. F. Sandercock of Natomario Ranch, Sacramento, is rejoicing over the arrival of 8 Berkshire pigs, sired by Riveon's Rival and out of Riverby Princess 3rd by Baron Duke. They are very uniform and of the big type—leggy and heavy boned. Everyone who sees them says they are killers.

The Western Berkshire Congress will hold a donation sale at the State Fair to raise funds to provide special premiums and carry on their promotion work. All breeders are asked to contribute and to report their action to Secretary Frank B. Anderson, Sacramento, before August 16.

Donald H. Graham of Rancho Del Sur, Lancaster, reports the following recent sales of Durocs: Fall boar to Sickles Ranch, Porterville; weanling boar to H. S. Harmon, Paso Robles; October boar to A. B. Tish, Bakersfield. All of this stock was sired by the great boar, Orion King Gano.

The highest price ever paid for hogs at any public auction sale west of the Rockies was received by the California Farm Bureau Marketing Association at its Hanford sale, August 2. The top lot, averaging 229 pounds, brought \$21.30. Eighty-six hogs, averaging 197 pounds, were sold for \$21.25.

The Tulare County Poland-China Breeders' Association will hold their

first annual summer sale October 21, at the sales pavilion, Tulare. The consignment will consist of 42 bred sows and gilts, 4 open gilts and 4 boars—all outstanding animals selected from 12 of the leading herds of the county.

Jack Borge, the Duroc breeder of Dos Palos, has recently sold the boar, Borge's Top Notcher, to H. Iverson, Gustine; a sow to H. Doyle, Dos Palos; a boar to R. E. Peckham, Los Banos; 2 sow pigs to Elmer Phillips, Los Banos; 2 sow pigs to Marshall Co., Los Banos; 1 bred sow and 5 pigs to Jack Donovan, San Leandro; boar to L. Mello, Dos Palos; boar to Miller & Lux, Dos Palos; 2 sows to J. T. Wallace, Dos Palos, and a board to S. H. Rigg, Chowchilla.

The Sensational Sale

We breed Poland-Chinas big and good in Fresno County, and to prove this we are going to offer at our first sale the greatest line-up of sows and gilts ever driven into a sales ring. They will be the big, smooth kind with great stretch, strong backs, heavy bone, well-sprung ribs and easy-feeding qualities.

POLAND CHINAS for PROFIT

The Poland-China is the money-making hog, producing the greatest gains in the shortest time, with the least feed, and at the greatest profit. He is a valuable breeder and a profitable feeder—the hog that puts the profit in farming.

50! Wonderful Sows and Gilts

There will be 30 bred sows, 17 bred gilts, and 8 open gilts, all outstanding individuals, and combining in their pedigrees the richest blood of the breed. They are sired by such noted boars as President, Jumbo's Equal, King's Big Bone Leader, Young Jumbo and Model Fellow. Among the eastern bred boars to which they will be bred are Vaughn Jones, a descendant of Gerstdale Jones; Hather's Big Bob, grandson of the world's champion; California Jumbo, a grandson of champion Giant Buster; and Blue Valley King, a son of King Big Bone. You need this blood in your herd to put you to the front.

Noted Breeders will Consign

The consignors are established breeders who have state-wide reputations, and their names are a sufficient guarantee of the quality of their offerings.

The Popular Farm Bureau Center of Tulare County will unite with the local Grange and hold a community fair about the middle of October.

G. D. Edmonds, a wealthy easterner, has bought the Dr. Cuttle Ranch near Colton and plans to have one of the most modern dairies in Southern California. He will start with 48 registered Holstein cows, 40 registered Duroc hogs and 100 Shropshire sheep.

The stock show committee of the Tulare Board of Trade is at work on prize lists for the fall stock show to be held October 6-11 at Tulare, and \$2,500 will be offered in the hog and cattle classes alone. Breeders from all over the state are making inquiries about the show.

Livestock Queries and Replies

Lump on Cow's Jaw.

To the Editor: A lump has developed beneath the skin of the neck of my cow, just behind the angle of the left jaw. It is hard, oval and about as large as a hen's egg. Apparently it is not attached to the jaw. What is this and what should I do?—F. W. H., Guerneville.

(Answered by Dr. E. J. Creely, San Francisco.)

First of all have your cow examined for tuberculosis, provided this has not already been done. If she does not react then split the enlargement wide open and pack it with gauze which has been dipped in Lugol's solution. This will allow it to drain and heal properly, and if there is no trace of tuberculosis you will not find it difficult to effect a cure.

Buttermilk vs. Skimmilk for Hogs.

To the Editor: Please publish the feeding value of buttermilk as compared with skimmilk for hogs.—L. E. R., Santa Rosa.

(Answered by the Live Stock Editor.)

Several tests have been conducted at experiment stations to determine the relative value of buttermilk and skimmilk, all of which have resulted about the same. A 125-day trial at one station showed that with 17 pounds of buttermilk and 4 pounds of corn per head fed to one lot, and 17 pounds of skimmilk and 4 pounds of corn fed to another lot of the same weight, the daily gain was exactly the same, being 1.67 pounds, and consequently it took the same amount of buttermilk to produce 100 pounds of gain as skimmilk. Often water is added to buttermilk and when this is done it reduces the feeding value, but where no water has been added but-

termilk may be considered fully equal to skimmilk.

Warts on Mare's Nose.

To the Editor: I have a mare that lately has a sprinkling of pinkish warts coming on her nose, ranging in size from a grain of wheat to a grain of corn. What can I do to remove them.—N. B. W., Thalheim.

(Answered by Dr. E. J. Creely, San Francisco.)

Snip off the ends with a pair of scissors and apply tincture of iodine (Churchill's). Next day apply stick silver caustic to each one and every other day thereafter for one week. Fowler's solution arsenic $\frac{1}{2}$ ounce daily for one week in the feed, and 1 ounce daily the second week, would assist in the cure and prevent other warts from forming.

Old and New Process Oil Meal.

To the Editor: What is the difference between old and new process oil meal, and which is the better for feeding purposes?—G. C. H., Chico.

(Answered by the Live Stock Editor.)

These terms refer to the manner in which the linseed oil is removed. In the old process the oil is removed by pressure, while in the new it is extracted by using naphtha. The oil is more thoroughly removed by the new process and consequently the feed contains considerably less fat than the old process oil meal, but more crude protein. According to experiments it is only 84% digestible. However, on account of the high amount of protein it is considered a better feed than the old process. Some authorities recommend the old process for feeding beef cattle and the new for feeding dairy cows.

Are Sheep Perishables?

(Written for Pacific Rural Press.)

The humble sheep, so long a symbol of meekness, has another characteristic and one that has worried the railroads. He is so apt to be frightened to death by the least little unexpected noise that the carriers consider him as "perishable" and place a high freight rate on him accordingly.

This is the novel statement made recently to the Interstate Commerce Commission by an official of the Southern Pacific Railroad, which is resisting an appeal made by Miller & Lux and other sheep men for a reduction in the rate on sheep in double-deck stock cars to an equality with the rate on market cattle. They maintain that the present disparity is unfair, as sheep weigh less than

cattle and the transportation problems involved are not greater than those with cattle.

The S. P. official claims that sheep are frequently scared to death, or huddle together because of fright and trample each other to death. He says the rasping of brakes or the noise of the exhaust gets on their nerves and they either drop dead or start a rough house. He claims that the transportation of sheep increases operating expenses, but the testimony of the official of another railroad shows that its sheep movement forms one of its biggest sources of revenue.

Let's hope that sheep will be removed from the list of "perishables" so that we can keep the home flocks growing.

Girls Herd Their Own Sheep

(Written for Pacific Rural Press.)

"After paying all expenses, I cleared \$1,240 from my sheep last year," reports Hazel Jeffrey, a member of a western sheep club. Several years ago she bought the first of a flock and has handled her sheep so successfully that last winter they numbered 103 ewes. In 1918 her flock produced 79 lambs, 76 of which she raised. These, with 7 orphan lambs abandoned by sheep herders, constituted the year's increase. All the care the sheep require is given them by their girl owner. This year she plans to buy 25 pure-bred ewes with part of her profits and use them to start a pure-bred flock.

Another girl in 1918 cleared \$923 with a flock of 48 ewes. During the

coming season these two girls plan to throw their sheep together and to herd them themselves. Orphan lambs discarded by other camps are also to be collected and cared for by the youthful herders. Members of the boys' and girls' sheep clubs in some of the Western States find the salvaging of "bum" or stray lambs an economical way of obtaining a start in the sheep-club work.

When the udder of a cow is milked out it should collapse like a dishrag. Meaty udders are undesirable. They are filled up with fatty and connective tissues—the wrong kind to produce milk. The texture should be soft and pliable.

Write for pedigree and price. Inspection invited and satisfaction guaranteed.

Shorthorn Sales Guarantee Endorsed

(Written for Pacific Rural Press.)

At the June meeting of the directors of the American Shorthorn Breeders' Association a uniform guarantee for both private and public sales was endorsed. This seems to be a long stride in the right direction, and we give the complete guarantee hoping that local breeders and associations may be benefited by it and will back up their sales with similar guarantees.

1. Proper care shall be given to protect breeding qualities and health of animals.

2. All bulls guaranteed breeders. A bull should not be allowed to serve when under 14 months of age.

3. Cows with calves by side under 4 months old are proven breeders. All other cows and heifers over 16 months old guaranteed breeders, but if over three months gone in calf, according to service date, and not proving to be in calf and not reported in three months from purchase, the seller in such case shall not be held liable. Heifers under 16 months not guaranteed. Heifers should not be served for first calf by heavy or old bulls.

4. All classes of animals failing to prove up under the foregoing guarantee must be reported to seller within six months from purchase except otherwise mentioned. Seller shall have option of having animals returned at his expense for further trial of four months.

5. Any animal failing to prove a breeder except as heretofore provided shall be replaced with another of equal value at the time of purchase to the satisfaction of purchase, or purchase price refunded, with no allowance for additional expense. Salvage to go to seller.

Animals sold tested for tuberculosis with government serum not more than 60 days prior to date of sale and passed as sound by a Federal or State Veterinarian or Veterinarian deputised by State Veterinarian, and copy of special authority from State Veterinarian placed on file in the office of American Shorthorn Breeders' Association, shall be considered free from tuberculosis and no further guarantee given, but when sold sub-

PROFITS FROM YOUR SILO

It has long since been proved that the silo is the one economical and profitable way to feed dairy cattle. The same amount of feed will go farther when turned into ensilage than if fed in the ordinary manner. Then, too, it is more appetizing and nutritious. All stock like it. It means healthy cows, more milk and greater profits for you.

Right now is the time when an Ideal Green Feed Silo, filled with rich, juicy, milk-producing silage,

would make it unnecessary for you to feed high-priced grain, and yet would put more milk in the bucket every day. Dairymen and farmers who have silos are securing 25 per cent greater production from their cows than those using dry feed.

All agricultural authorities recommend the wood stave silo. It is inexpensive, easy to erect, needs no attention, is not affected by climatic changes, and will last a lifetime if built of the right wood.

The Ideal Green Feed Silo

is made from clear California Redwood, which long experience has shown to be the wood best adapted for silo construction.

The staves are tongued, grooved, bevelled and splined by specially built machinery. The doors are of the refrigerator type, leakproof, and cannot jam. They are continuous from top to bottom of silo.

Ideal Green Feed Silos are equipped with heavy, soft-steel hoops, made to withstand all conditions, and are strong enough to last for years. Hoops are provided with malleable iron lugs and long upset threads to permit easy adjustment. Write today for catalog and price list.

Own a Water System

No farm or dairy is complete without a water tank. Plenty of water is just as essential as plenty of feed. A Pacific Redwood Tank will insure your water supply, add to your profits and increase the value of your property.

Pacific tanks are fitted with patent non-shrinking feature that absolutely prevents leakage. They are built right and possess the everlasting qualities of Redwood. You can easily own one. Send for booklet and price list.

Nation-Wide Drive for Better Livestock

Looking forward to the future food needs of this country's increasing population, the Department of Agriculture, in co-operation with the state agricultural colleges, breed associations, and other agencies interested in livestock improvement, announces a national better-livestock crusade, to get actively in motion October 1 under the slogan of "Better Sires—Better Stock."

The plan is to hasten the replacement of the multitude of scrub animals in the United States with purebred or high-grade stock and also to improve the quality of purebreds themselves. It has been evolved through long and careful observation of the livestock industry and after extensive consultation with specialists and breeders.

For many years this country has contained thousands of the finest specimens of livestock in the world, yet the quality and productive capacity of the average farm herd and flock is still low. For instance, the average dairy cow in the United States yields about 4,000 pounds of milk per year, a figure scarcely two-thirds of the average production in some European countries, such as Denmark.

Among all classes of livestock a similar condition exists. Proper breeding of beef animals results in better and more uniform stock, having a greater percentage of desirable cuts of meat and a smaller quantity of bone, offal and inedible parts. Likewise in swine, sheep, goat and poultry production, the kind of parent stock largely determines the quality and market value of the products.

The means of accomplishing most of the improvement—which affects about 200,000,000 head of livestock, besides poultry—will be through wider distribution and increased use of pure-bred sires and dams. Once the use of pure-bred sires becomes general throughout the country, the process of grading up will be rapid. Within three generations most of the individuals in a scrub herd headed by a pure-bred male resemble pure-bred animals in appearance. In a few more generations, under skilful breeding, the former scrub stock is graded up to such an extent that for production of meat and other animal products, they are practically as useful as purebreds.

The Department of Agriculture through its co-operative state agencies, is preparing to supply livestock raisers with printed information that tells in popular language the best animal breeding methods and the advantage to be derived from their use. In addition, the Department is to furnish an official emblem, suitably for display, to every farmer agreeing to use only pure-bred sires and in other ways to co-operate in the better-livestock effort. To obtain the emblem he will be asked to fill out a simple blank showing the number and kind of livestock he possesses and also to declare that all his male breeding animals are purebreds.

Organization of Campaign.

The betterment of the nation's livestock is by no means a new idea. The topic has been discussed at length from public platforms and in the agricultural press for many years. A general co-ordination of the work now seems desirable, with a minimum of red tape and a maximum of red blood. The Bureau of Animal Industry will be responsible for livestock policies, especially the breeding work and scientific problems. The States Relation Service will work in co-operation with the colleges of agriculture for carrying the plan of action through the extension divisions to every livestock owner who can be reached. County agents and other field workers of the Department and the colleges will be local sources of information and assistance.

In spite of the conspicuous merits of the task, there are also a number of obstacles. Sentiment in favor of purebred sires, while strong, is by no means unanimous, and to win the

support of those who, through lack of interest or opposition, fail to take their part in the crusade against scrub livestock is one of the problems to be met.

The cost of desirable pure-bred sires is another important factor which has long been an obstacle to livestock improvement. Co-operative ownership divides the expense considerably, and the increased value of the young stock raised also helps to overcome that objection.

The question of controlling the spread of livestock diseases, when animals are transferred from one herd to another or are used in community circuits, is still another problem.

There are other problems more or less knotty, but not presenting difficulties of an insurmountable character. In connection with the drive on scrub sires there will also be waged a campaign against "scrub purebred," as it is called, in the endeavor to eliminate, as breeding animals, purebreds of inferior quality. The plan in no way interferes with any work in livestock improvement now being conducted, but instead it is expected to make all the work more definite and effective by providing official recognition for progressive breeders, including members of boys' and girls' clubs. Friendly competition is expected to spring up among communities and entire states, each of which will seek to excel in the rate of livestock progress.

CALIFORNIA BRAND BOOK NOW READY.

The California Cattle Protection Board has compiled a catalog containing all recorded cattle brands in use in this state to date with an in-

dex of all brands recorded, also a list of all licensed slaughterers.

The book contains a copy of the act of May 28th, 1917, known as the Hide and Brand law, together with other laws, rules and regulations of interest to all cattlemen and slaughterers. It is made up in a convenient size, attractively bound, and no doubt will be of great benefit to cattlemen of California. A copy will be mailed to anyone upon receipt of \$2. Address James B. Newsom, Executive officer, Cattle Protection Board, 612 Underwood Bldg., San Francisco.

NEW FEATURE AT FRESNO POLAND-CHINA SALE.

The Fresno Poland-China breeders do not intend to be outdone by their corn-belt brothers. Back there a large number of the hogs offered at public sales are bought by field men for clients who cannot attend. The Fresno breeders not only will inaugurate this method at their sale, to be held at the Fresno Fair Grounds, August 20th, but will allow field men to bid only on animals whose owners will ship on approval, thus assuring absent buyers of absolute satisfaction. If that isn't sufficient proof that the offering will be a high-class one, then we don't know the Golden Rule.

So if you can't attend, don't let this stop you from securing some of the corking good sows and gilts that will be offered. Send for a catalog, pick out the animals you want to bid on, and instruct our field man, Mr. Thos. F. McConnell, how high to bid. Or if you can't decide from a reading of the catalog, tell him the kind of an animal you want and he will give you the benefit of his years of experience in making the selection for you. Address him in care of Walter C. Fichlin, Secretary, Route A, Box 189, Fresno.

MINERALS FOR MOLTING HENS.

August is the month when our poultry commence in earnest to "take off the old and put on the new." Molting is a natural condition, and the workings of Nature should not be interfered with to any great extent. Instead, old Mother Nature should be aided in her work.

A few years ago we had a "forced molt" craze. The idea was that if hens were starved for a few days they would drop their feathers in a bunch, and then by heavy feeding the new feathers could be brought in quickly, thus shortening the molting period and getting the hens back to laying in jig time. It sounded great, and in some cases the method did secure a few more eggs. But it did so at the expense of vitality, and in the long run the results were not satisfactory. The fad could not make good because it was against Nature.

The natural molt of fowls is slow and almost imperceptible. The birds drop a few feathers at a time and the new ones come in as the old ones are dropped. Many hens still molt this way, but the ones that have been forced for heavy laying generally show a ragged, nearly naked condition. Probably this is due to exhaustion from heavy laying, as male birds very rarely lose their plumage in this way.

A molting hen needs rest most of all. The mash is the part of her feed that forces her for heavy egg production, so cut down on the forcing mash and feed more whole grain and plenty of green stuff. If hens can be allowed to range in an orchard or over alfalfa fields, so much the better, but don't cut off their feed entirely and make them live on what they can pick up on the range. Don't get the idea that just because they are shelling out very few eggs you can't afford to feed them liberally. They need feed rich in feather-forming materials, and if they don't get it they will be obliged to draw on their own systems for what is needed. And this means that later on they will take a long rest to restore themselves.

While the feathers are dropping, a little oily food helps the process. Oats, sunflower seed and flaxseed are examples of such foods. Heavy oats are good, but it is difficult to get them, and the ordinary oats are only good enough for sprouting. Sunflower seed is excellent, but it is heavy in fiber and must be fed in moderation. Soy bean meal is one of the most desirable of all concentrated foods, but it should be fed with plenty of green feed. Coconut meal and cottonseed meal are used; also tallow is sometimes melted and mixed in the mash water when a wet mash is fed.

Feathers are composed mostly of mineral matter, so during the latter part of the molt the feed should be narrowed down to ingredients high in mineral content, both vegetable and animal, and still without other things that demand energy to digest them.

Alfalfa excels all other green feeds in mineral matter, and hens should be induced to eat liberally of it. To increase its consumption it can be added to the mash, cut in short lengths, provided a dry mash is fed. Moistened with sour skimmilk and you will have an ideal feed. If alfalfa is not available, feed clover, kale, cabbage, rape—some green feed in abundance.

Animal mineral must also be provided, and this may be supplied by beef, bone or fish meal. Dried blood meal is very rich in protein and mineral, but must be fed in small quantities, as it is inclined to be constive. Feed lightly of starchy feeds. They have little use in a molting hen's ration.

Be sure to provide plenty of fresh, cool water. When the system is being drawn upon for a new coat of feathers there is considerable feverishness, and this condition calls for water. The fresher and cooler it is the better it will serve to keep the

hens in good, healthy condition during the molt.

RABBIT BREEDERS ORGANIZE FOR MARKETING.

A conference of rabbit breeders was recently held in the office of Harris Weinstock, State Market Director, to consider the advisability of organizing. It was the opinion of those present that it would be necessary for breeders to organize in order to stabilize the industry and enable producers to get the largest possible share of the consumer's dollar. It was explained that such an organization could also increase the production of rabbits and do collective buying of feed and supplies. The matter was considered of as much interest to fancy breeders as to the breeders of utility stock, because unless the industry can be made permanently profitable many of the breeders of utility stock will drop out, thus minimizing the possibilities of the fancy breeder. Circular letters have been sent out to ascertain how many producers are interested and will join such an organization. Another meeting will be held at an early date at which time an association probably will be formed.

There is a similar movement among the rabbit breeders of the bay counties, and several meetings have already been held at Oakland. The objects of this association are to do collective buying of feed and supplies; to devise means of selling market rabbits direct from producer to consumer; to advertise the value of rabbit meat and increase consumption; to carry on improvements in standardizing feeds. The promoters of this association point out that the producer receives about 12c per pound net live weight, while the consumer pays about 22c per pound live weight, so that there is a profit of 10c for selling. It is believed that by co-operative selling from 5 to 7 cents can be saved the producer.

LET THE SUNSHINE IN.

The above is the slogan of the Experiment Station at Davis when it comes to poultry house construction. The advice is to build so as to keep out high winds, drafts and rats and to let in the maximum amount of sunshine. Sunshine is the best of germicides and keeps the layers healthy and cheerful.

The model laying house is recommended by the station as 16x20 feet, 8 feet high in front and 4 at the rear, with open front facing south and a shed roof. Tongue and groove lumber should be used in the construction, with shingle roof, if the expense is not too great. The floor should be of cement, which is more sanitary than dirt or wood and can be made rat-proof. Such a building will house 100 Leghorns in 2 pens, or 125 in one pen.

The house should be comfortable, for the laying hen is a high-strung, temperamental creature, incapable of doing her best in an unfriendly environment. It must furnish ventilation without drafts, coolness in summer and adequate protection in winter, and must be absolutely sanitary.

In the house recommended by the experiment station a hood is built over the roosts, allowing a current of air to pass into the house and over the heads of the hens without causing a draft upon them.

DUCKOLOGY.

For a pound of feathers it requires the plucking of ten ducks.

The best quality of market ducks are white-skinned. Yellow-skinned carcasses do not sell so well.

It is cruelty to pick live ducks. Ducks should be handled by the neck, never by the legs or wings.

Fattening ducks should never be allowed bathing water.

Exposure to hot sun is fatal to young ducks.

Approaching a pen of ducks at night with a lantern is sure to create a panic.

After ten weeks of age the weight of a duck is more apt to decline than increase.

Confectioners claim that duck eggs are superior to hen eggs for their line of goods, as they put glaze to their icing which the latter do not.

Vines planted along chicken yard fences will provide lots of welcome shade. Grapevines will supply shade and also prove profitable in the fruit produced.

Keep the dishes that the little chicks eat and drink out of neat and clean. Little chicks love milk as well as the older ones, and how it makes them grow! Every try it?

Poultry Breeders' Directory

MOST FALL CHICKS ALREADY BOOKED. yet hundreds open most weeks, reduced, in each of seven popular breeds. Clearing customers, \$5,000 yearly. 200-290 egg strain. Large, vigorous winter layers. THE HOME CIRCLE

IN OLDEN DAYS.

In olden days the Lord our God,
Revealed to the children of men,
The stepping-stones, in their future
life.

What they should do and who they
should wife,
And the end of all their battles and
strife.

But now-a-days there are some who
say,
There is no need of this,
But somehow down deep in our
hearts,
We ask, (as on life's journey we
start),
Why should we from the old way de-
part.

For in ancient times by fasting and
prayer,
And by faith that was right with God,
They always found their leading star,
And it's the same today wherever you
are,
Our God would still be our guiding
star.

For in wisdom were all things made,
we say,
And the task was severe and hard,
Then why should we labor and work
and pray,
And strive for the things that pass
away,
But expect God's Everlasting Truths
to come on a silver tray.

Then we pray for the spirit of fasting
and prayer,
The same as they had of old,
And pray that thou will help us live,
A life that is true and bold,
For Jesus has redemption won,
By full surrender, Oh, God, to Thee,
And in His name we have begun,
A life that is full and free.

Then we praise Thee, Oh, God,
With all our might,
For Thy wonderful wisdom and love,
And to serve Thee every hour and mo-
ment,
Of the day and night,
Is a message from Thee above.

—O. D. Holmes, Houston, Texas.

PETER VAN AND THE TRAIL OF HOPE.

(Written for the Pacific Rural Press by Lucy
M. Thompson.)
(Concluded.)

Peter didn't like the idea of that
two acres lying idle, so he planted
the whole plot to potatoes, although
it was the last of June and he knew
that they might not mature before
frost, and that, as he had no way of
irrigating them they would not make
a crop unless fate decreed that it
should rain at least twice during the
next two months. Peter took the
chance and it rained not twice, but
four times that summer. The potatoes
brought him a little over a hundred
dollars.

That fall the homesteader's mother
offered the place to Peter for \$450.

More Light Than 20 Oil Lanterns

with stock and implements, just as
it stood. Of course the stock was
worth almost that much, and Peter
felt that he was getting the land for
nothing. It really wasn't worth much
just then, however, being 60 miles
from market, 18 miles from a rail-
road and 8 miles from a post
office, with roads none too good,
and no rural delivery. Then, too,
at least half the place was so rough
and uneven that it could never
be cleared for field crops. Clearing
was a slow, laborious task, for the
place was rather heavily wooded.

But Peter wanted it; it was a job
that he could handle without special
training and in spite of bad eyes. He
felt that his few hundred dollars would
make him independent in no other
way. So he bought it, installed a
pump at the spring where a well was
drilled and the next spring seeded five
acres to alfalfa. He cleared six acres
that first winter and planted four of
it to corn in the spring. Six acres
went to oats and four to potatoes,
leaving two acres for garden and
Egyptian corn for chicken feed.

The chickens kept them in groceries
that winter and in the spring Mrs.
Van picked out 15 Plymouth Rocks
that showed good blood and bought a
thoroughbred rooster. From this pen
she got her setting eggs. Plymouth
Rocks are great setters, and those in
Mrs. Van's breeding pen were no ex-
ception so she went to a neighbor
down the valley and bought a few
settings of Plymouth Rock eggs from
good stock. She didn't want to hatch
out scrubs and did not object to the
high price asked.

She had two enemies to fight, the
hawks and the coyotes. Laddie, the
collie, kept an eye out for the coyotes
and they did not bother much, but the
hawks got away with about three
dozen of her young chickens. There
was some loss from various other
causes, but despite all this she sold
45 fryers and had several dozen pul-
lets for winter egg-production, be-
sides plenty of friers and roasters for
home use. She sold the hens of
mixed breed when they stopped lay-
ing and began to molt, and so had all
chickens of good blood to start the
next year's work with.

They had no summer rains that
year and the corn, being too far from
the water supply to irrigate, was
hardly corn at all. When Peter saw
that it was drying up he cut it, a
wagon load each day and fed it to the
cows and as a result the milk supply
increased until Peter had to buy half
a dozen pigs to use up the milk. They
were too far from the railroad
to send the milk in to the creameries,
and the little country store eight
miles away was so swamped with
ranch butter that the price offered for
it was so low Mrs. Van decided it
would not be worth while to make
any more butter than they could use
at home.

Peter didn't think he wanted to raise
hogs until he saw those six porkers
putting on weight as a result of the
abundance of milk and alfalfa that
was fed them, but he soon took to
leaning over the fence in spare time,
"watching them grow," he said.

The oats made nine tons of hay and
the four acres of alfalfa made five
tons, besides furnishing grazing for
the hogs through the summer. Late
in the fall another cutting was made.
The hay was baled. A neighboring
homesteader, who owned and operated
a baler through that section, said that
Peter's alfalfa was the first alfalfa
hay he had ever worked with. He
was so impressed by Peter's success
with alfalfa that he seeded some the
next year on his own account.

Peter's hogs were marketed in
November at a fancy price, and Peter,
who began to see that hogs, with milk
and alfalfa to back them, were money-
makers, took the proceeds from the
hog sale and bought a thoroughbred
Guernsey cow and a Duroc-Jersey
sow of good blood for breeding pur-
poses.

Twenty tons of hay was more than
Peter could make use of, for the hills
furnished good grazing practically the

whole year, so ten tons of it was sold
to a grading camp that was working
on the State highway in the moun-
tains beyond.

Mrs. Van's pullets settled down to
work just before Christmas and
turned out eggs so fast that Peter had
to make two trips a week to the city
60 miles away with the eggs. He used

so much gasoline that he little more
than came out even, and Mrs. Van had
about decided to give up her egg-pro-
ducing venture when a young man
with a four-ton truck drove in one
morning and offered to market their
produce at a reasonable rate. This
solved that problem. After that a
package of eggs and a can of whole

Woodshed Memories

Remember the old Woodshed.—It was the family gymnasium
and father's favorite "warming" room to fix Willie's jacket. If
said Willie, or father himself, "forgot" to cut the wood, then poor
mother had to see to it herself—ask mother, she knows.

Now all is changed. There is no need of a woodshed and
Willie's jacket doesn't need fixing because there is no wood to cut. No
more slavery for mother; she cooks and heats with real gas—by the
scratch of a match she has a fire that is far quicker in results and with-
out any muss or dirt and loss of fuel. The same good old stove is there
—no changes have been made in that; we simply make use of our old
friend Kerosene, which scientific methods and a Dreadnaught Burner have
made possible.

It's the ever repeated case of "We didn't know what we were missing—
how did we ever get along with mussy, wasteful wood and coal?"

Have a little surprise party of your own—install a Dreadnaught before
cold, rainy weather sets in—eliminate the drudgery and have more comfort
for less money. We would like to send you our circular—your name and
address is all we need.

milk was sent in on the truck every Tuesday, Thursday and Saturday.

When the litter of pigs arrived Peter decided to buy a cream separator so that his pigs could have all the milk they wanted. He invested in a new machine that made it possible to receive a monthly check from the creamery and still feed milk to the pigs. He bought 14 pigs more and another cow, giving his note for the amount, which was payable in six months.

In February Peter built another room to the two-room log house and made several changes for the better around the house in anticipation of an expected visitor. In March Billy Van arrived for an indefinite stay. He was tiny and red and wrinkled, and weighed just eight pounds, but he was "some boy" to his delighted parents, who had about become reconciled to their childless state. Billy arrived just in time to upset his mother's plans for raising a record lot of young chickens to sell as friers and but few hens were set that year.

Peter had cleared several acres that winter, renting a stump puller from a neighbor to hasten the work, and spring found him with four more acres, making 30 acres in all.

The two yearling steers that they found on the place had been fattened and sold the fall before; but there were three calves that had been dropped since Peter took the place that he meant to fatten that fall along with his twenty-five pigs.

The corn suckered so heavily that he drove to the field every day for two months and brought back a wagon load of fresh green suckers for the four cows, and the cream checks almost doubled in amount, while the pigs had their milk ration increased.

Owing to two rains during the summer the corn made 34 bushels to the acre, and the potatoes yielded 75 sacks to the acre.

The first plantings of alfalfa gave four cuttings besides being grazed by the hogs, and the new stand gave two cuttings. The year's output of baled alfalfa hay was 32 tons, of which part was sold to the grading out-

fit on the State highway, which had progressed to near the forest ranger's camp by this time.

The 25 pigs were sold at a good price, the United States having entered the war that year, and Peter bought two more thoroughbred Guernseys and a bull of the same breed besides a couple of thoroughbred sows and a boar.

A railroad completed a branch line into the back country and located a station four miles from Peter's ranch. A rural mail route is established and the Van's have their mail delivered at the gate.

Peter threw his colored glasses away the day little Billy was a year old. His eyes are not tired any more; he says that is because his ranch has become a "sight for some eyes," as indeed it has.

The figures on his monthly cream check look like a millionaire's son's monthly allowance. Half a dozen fine Guernsey cows, three or four promising heifers, several steers that show their good blood and a bull that brings in a tidy sum in service fees speak for Peter's prosperous estate, as do the thoroughbred Duroc-Jersey hogs and the handsome flock of money-making chickens.

There are 15 acres in alfalfa now, and a new silo that takes care of several acres of corn and sorghum cane each year. The cultivated area of the ranch is increased by several acres each year as Peter finds time to clear the ground.

"The fates sure smiled on us when we started out on the trail of hope four years ago," said Peter to his wife one night this last spring as they sat on their front porch and watched the sun sink in a cloud of glorious color while Billy endeavored to make Laddie believe he was a dashing charger and Billy a knight astride him.

"We have found our place in the world," said Peter Van, "and if other square pegs in round holes should ask me for advice I'd say, pack up and hit the trail of hope, old man, and ten to one it'll lead you to a square hole that'll fit you to a T."

(The End.)

GIRLS.

There are girls that make us happy,
There are girls that make us blue,
There are girls that need a lot of coaxing

When you want to steal a kiss or two.
There are girls that come from sunny Dixie,

There are girls that smile and girls that frown,

But the girl that a fellow wants to tie to

Is the girl from his own home town.

—Santa Rosa Republican.

NEW RECIPES.

Baked Steak.—Order a thick round steak. Salt and pepper both sides well and put into a roasting pan. Chop one small onion fine, sprinkle over the top of the steak; next a layer of chopped parsley; some green pepper improves the flavor wonderfully. Place slices of lemon cut in half over the top and sprinkle all with paprika; about 3 tablespoons of tomato catsup sprinkled about and lastly lumps of butter; put into a hot oven and bake 20 minutes; do not baste, in fact, do not open the oven door at all. Remove to hot platter garnished with parsley and serve at once.

Mock Duck.—Take a nice round steak about one inch thick, five thick slices of stale bread, six medium-size cold boiled potatoes, one-half cup chopped celery, one large onion, two eggs, one tablespoon butter and one teaspoon finely chopped parsley. First soak bread in cold water; meanwhile chop and fry the onion nice and brown in the butter; squeeze the water out of the bread and add the fried onion; add the eggs and potatoes (which should be diced), celery and parsley; mix well, season to taste and if found too dry add a little milk. Spread the stuffing over steak, roll and tie, brown in a frying pan, then put in a roaster, add a little water, salt and pepper and put in the oven. Baste often and cook until tender, then serve with gravy and parsley sprinkled over it.

Beef a la Newport.—Butter, the size of large egg, two-third cup dried smoked beef ground in food chopper (or picked fine), ½ cup grated cheese, or cut fine, ½ cup canned tomatoes, 4 eggs slightly beaten. Melt butter, add beef and cheese, stir till cheese melts, add tomatoes and stir. When thoroughly hot, not boiling, add the eggs. Stir continually till all come to boiling point. Add paprika, no salt. Serve very hot with toast or hot rolls.

Preserved Pears.—Use acid pears for preserving. If the fruit is small preserve it whole, if large, cut in halves. Peel the pears with a silver knife and drop them into cold water as fast as they are peeled to prevent discoloration. When the fruit is all prepared allow a pound of sugar to each pound of pears. Put the fruit over the fire with just enough water to cover it, and boil it gently until it is tender enough to yield to a slight pressure of the fingers; meantime put the sugar into the preserving kettle, adding to each pound a pint of cold water, and to every five pounds of the sugar add the thinly pared yellow rind and juice of two lemons, and two ounces of green ginger root scaled and scraped; boil the syrup and remove all scum as it rises; when the pears are boiled, as directed above, put them into the syrup, and boil them until they look clear; when the pears are thoroughly penetrated with the syrup, remove the preserving kettle from the fire, allow the preserves to cool, and put them in glasses or jars as usual for preserves and jams.

Sweet Potatoes in Marshmallow Lid.—Here is the formula for a delectable dish that speaks for itself: Boil sweet potatoes with jackets on. When done remove skin and mash same as white potatoes, with salt, butter and milk or cream. When beaten till light and fluffy, put in baking dish, cover top with marshmallow, put in slow oven and bake until nice and brown.

Convert your old-fashioned bathrooms

into modern bathrooms to which you can conduct your guests with a feeling of pride.

The combination of beauty and simplicity contained in Pacific Plumbing Fixtures make them the vogue. Their added convenience, and the amount of unnecessary work they save, will more than compensate for their moderate cost.

Write for a copy of the Book of Bathrooms. It's a 56-page book, brim full of helpful ideas on bathroom arrangement.

The Gasoline of Quality

Market Comment

Profitable Poultry District.

Poultry in the Haywards district is bringing in \$7,000,000 a year. This section ranks second in importance in the poultry business of the State.

Rice on the Upgrade.

Rice bids for the 1919 crop have gone up to 5 1-2 and 5 3-4 cents per pound, and John G. Beekler, a director of the Pacific Rice Growers' Association, advises growers against contracting too early.

Orient Seeks Modesto Butter.

Modesto butter is now sought by Japan, China, Russia and South Sea countries according to orders that are now being booked for export to the Orient by the Modesto plant of the Milk Producers' Association.

Hanford Hogs High-Priced.

Hogs brought the highest price ever paid west of the Rockies, \$21.30 per hundred weight, at Hanford last week when the California Farm Bureau marketing association sold 35 hogs averaging 229 pounds, for that price.

Sonoma's Hops Eagerly Sought.

All old hops at Santa Rosa have been cleaned up at the good price of 55 cents a pound. Many thousand pounds of last year's crop are being shipped now. There remain only a few hops in the county that have not been contracted for.

Country Sales of Barley.

Barley is selling in the country at from \$3.10 to \$3.75 per cental with the market on an upward trend. A greater percentage of the crop will be sold this year by the growers than ever before. Since the advent of the new crop, practically no supplies of the shipping grade have arrived on the San Francisco market.

Offers of Fictitious Prices Denounced.

Fruit Associations composed of growers have accused packers of offering false prices, stating that fabulous prices are offered to independent growers to withdraw them from their merger with Associations. Wylie M. Giffen, president of the Raisin Association, has just made a public statement denouncing the practice on raisin growers.

Pay for Almond Pickers.

Almond pickers in the Esparto district will be paid 50 cents an hour, or an alternative of \$3 a day and board during the harvest season according to the decision reached by the Capay Almond Growers' Association. The working day is to be nine hours. The Association has 116 members and operates a warehouse steam bleaching plant.

The Alfalfa Markets.

Alfalfa sales during the past week through the Alfalfa Growers of California, Inc., show prices obtaining for the grower of \$18.50 to \$21 according to grade and shipping point. In the lower San Joaquin districts growers are holding for \$21.00 to \$22.00. Grinding mills are offering \$17.00 to \$17.50 in stack. In the Sacramento districts buyers have been active and have made bargain purchases as low as \$19.00.

Apple Harvesting at Sebastopol.

It looks now as though apple men there will net \$2 to \$2.25 a box for the season after paying for packing and marketing. Early apples are now bringing \$2.75 and \$3 a box f. o. b. Take 55 cents from this for packing and handling and it looks like a good start. Two firms are reported buying packing apples (including 4 1-2 tier) in lugs at \$90 a ton delivered at any shipping point. It is now expected that there will be 750 cars of Gravensteins of 766 boxes to the car from this section. This variety is a full crop. Late apples show 60 per cent to 70 per cent, though Wagner's look full. Gravensteins have been picked pretty freely to forestall drop and develop the balance. They have to be kept in the light to color and ripen. Earlier pickings were pretty green but they were used for cooking and the market takes them up. Up to \$5 a day is being paid for real good pickers, but help is scarce.

THE MARKET REPORTS

Figures Given Are Independent and Reliable.
Prices Quoted as Paid to Producers.

SAN FRANCISCO.

San Francisco, August 6, 1919.

WHEAT

There is little feature to the local wheat market, its strength being based principally upon the firmness of the eastern markets.

CORN

Despite the drop in corn prices on the Chicago exchange, corn sold at a higher price here this week than the previous week. This was because of a good demand with an apparently real shortage of supply.

California	\$3.50@3.70
Egyptian, choice	Nominal
Milo	Nominal

HAY

Receipts of hay this week were 2,655 tons. This is not materially different from the previous week's receipts of 2,770 tons. As in the case of the previous week the most of this hay came in by water from the Bay and River districts. There seems to be a shortage of cars, and it is difficult to get them for several days after orders have been placed, and even then only in a small way. With a shortage of cars appearing so early in the season, it is feared that it will become worse than usual as other crops are moved. The demand has been good here and most of the receipts were moved without difficulty. Alfalfa continues in demand and is the leader at present.

POTATOES, ONIONS, ETC.

There was no particular activity in the vegetable market this week. Potatoes and onions are dull and unchanged. Peas and beans continue to come in in large quantities and some very fair stock has been sold at prices considerably below current quotations. Tomatoes met with a falling off in demand and the increased receipts made the prices lower in many cases than the quotations given. These lower figures were in most cases where the dealers were over-supplied, and they cannot be taken as market indications. Summer squash is coming in from Alameda county exclusively now, and the flood of arrivals pushed the price to about the low point of the season.

BEANS

The demand for beans continues strong and the market is active. It now looks as if the holders of beans are going to clean up at prices that will pay them a comfortable profit. With the exception of Tepary and Garbanzo beans, prices were advanced all along the line. While Limas are quoted at \$12.25, some sales are reported at \$12.50, and as they are scarce a continued demand will force the nominal quotation of this variety much higher. In most cases the advance in price was from 25 to 50 cents per ctl.

Bayos, per ctl.	\$6.25@6.50
Blackeyes	\$5.50@5.75

Small whites	\$8.00@8.15

POULTRY

The poultry market has been steady during the week. Receipts have been large, but the

demand is excellent and the market keeps fairly well cleaned up at the close of each day. It is the kind of market in which both the producer and commission man should be making money. Leghorn hens and smooth young roosters sold at lower prices, but with this exception and that of Jack rabbits, which are apt to fluctuate violently from day to day with the receipts, no changes are noted in the ranges quoted last week.

BUTTER

Butter developed a decided weakness on Tuesday and Wednesday of this week, despite the fact that receipts have been somewhat light. One of the main reasons for the recessions in prices has been the fear of a general railroad strike, which may tie up shipments, and a perishable product like butter would suffer heavily if left without refrigeration on the road. Under present receipts butter would be expected to advance in price, and it will doubtless do so if the menace of interrupted transportation is removed. There are over 2,000,000 pounds of butter in storage in this market, which is about fifty per cent better than the records of last year at this time. As a consequence little more is expected to go into storage in this city. The movement out of storage was greater this week than was that into storage. Chicago has over 30,000,000 pounds and New York over 25,000,000 in storage, which represents an amount fully three-quarters greater than those two cities held a year ago.

EGGS

Eggs advanced in prices steadily during the week, reaching a figure 2 1/2 cents higher than last week's close for Extras and 4 cents higher for extra pullets. These prices are respectively 6 cents and 8 1/2 cents above the low of last week. No shipments East are being made at this point, but some are known to have occurred from points of production and others are rumored. Egg producers do not seem to have the same fear of a railroad tie-up as the butter men.

FRESH FRUITS

The market was flooded with cantaloupes this week and prices went to pieces. Flats containing 15 choice cantaloupes sold as low as 50 cents and other packings in proportion. The berry market did not show a great deal of change. Strawberries sold a dollar higher and the others a dollar lower. Grapes are coming in in ever-increasing quantities and the price has been lower in consequence. Figs were higher, but most of the other varieties of fruit sold at about the same prices as last week.

DRIED FRUITS

The dried fruit market continues strong, and several fruits were bid up to considerably higher points than those reported last week. Apricots still seem to be the leaders in the demand, and as high as 33 cents was bid in some cases for selected stocks. The bids for apples and peaches were also advanced to higher standards. Figs remain unchanged.

RICE

While there is a temporary lull in trading in all grades of foreign rice at the present time the business was very active throughout the month of July. During the month the

Special Deciduous Market Report

(Written for Pacific Rural Press by J. L. Nagle.)

Sacramento, Cal., August 5, 1919.

The demand for all varieties of fruits, even under heavier offerings of Bartlett's, was in keeping with the supply, an upward tendency being particularly noticeable on peaches and plums. In fact, the demand for California peaches in Atlantic Seaboard markets, is strengthened on account of the fact that Eastern stocks are arriving showing considerable mold.

The light supply of plums resulted in a sharp advance of all varieties.

The Bartlett pear market is holding firm though the peak of the load has at present arrived in eastern terminals. We do not look for any noticeable decline, but anticipate a strong demand, subject somewhat to fluctuations by offerings of Bartlett's from the northwest which are now rolling.

Thompson Seedless and a few early shipments of Malagas from the Fresno district that have arrived east, have met with a very ready demand and at prices considerably higher than corresponding dates of shipments last season.

Shipments of Elbertas, both from the San Joaquin Valley and Placer county, are now moving under heavy supply, but practically the entire crop can be disposed of on a delivered basis at prices in excess of those offered by the driers and canners.

Shipments from the State of deciduous fruit this week will be very heavy, provided transportation difficulties will not affect the move-

ment.

The Bartlett pear shipments from the Sacramento River are about completed, but shipments from Suisun, though not as heavy as last year, will continue, as will the movement from Placer county, for two weeks. Colfax and El Dorado county Bartlett's will begin to move the latter part of the week. Averages for the week:

NEW YORK: Bartlett Pears, \$4.01; Malaga Grapes, \$3.74; Muscats, lugs, \$3.70; Thompson Seedless, \$3.39; Tuscan Peaches, \$1.82; Crawford, \$1.38; St. John's, \$1.05; Hales, \$1.05; Elbertas, \$1.45; Tragedy Plums, \$2.04; Burbank, \$2.08; Wickson, \$2.82; Diamond, \$2.50; Calif. Blue, \$2.22; American Blue, \$2.18; Splendor, \$2.32; Calif. Red, \$2.35; Shiro, \$2.05; Kelsey, \$4.00; Gaviota, \$2.85; Duane, \$1.87; Bradshaw, \$1.85; Einioti, \$2.07.

BOSTON: Burbank Plums, \$1.84; Wickson, \$3.20; Gaviota, \$3.00; Tragedy, \$2.27; Calif. Red, \$2.22; Duane, \$2.07; Diamond, \$2.28; Kelsey, \$2.67; Bartlett Pears, \$3.75; Malaga Grapes, \$3.56; Thompson Seedless, \$2.38; Hales, \$1.57; St. John's, \$1.47; Tuscan, \$1.82; Decker, \$1.87.

CHICAGO: Malaga Grapes, \$4.00; Thompson Seedless, \$3.00; Bartlett Pears, \$3.68; St. John Peaches, \$1.50; Crawford, \$1.63; Tuscan, \$1.74; Elbertas, \$1.81; Diamond Plums, \$2.21; Tragedy, \$2.10; Kelsey, \$2.45; Bradshaw, \$1.66; Duane, \$1.80; Wickson, \$2.74; Dukes, \$2.25.

mate can be made.

There has been a large demand for sound stock California lemons, while low grade fruit is a drug on the market and is selling at very low prices. The outlook is for a generally higher market on lemons during the remaining five weeks of the summer season. The total shipment of cars of oranges for the season commencing November 1 were 28,285 and 8,117 cars of lemons.

Special Citrus Market Report

Los Angeles, Aug. 4, 1919.

Regarding the market on California Valencias, recent reports show the movement out of stores very active. Small markets that formerly placed orders for twenty to fifty boxes are now taking carloads. Nothing new has transpired regarding the coming crop of Navels, and it will be the latter part of August before an approximately correct esti-

price was advanced locally \$1, while in the Orient it advanced \$5. In view of this fact it is expected that prices will make another advance here. New crop California Japan fancy sold at \$11 for delivery November and December, but at present dealing in futures is not active.

HONEY.

Owing to the reported probable scarcity of honey on account of the hot weather in the valley, local dealers have advanced their bids over their last week's offers, but no sales of any amount at these figures are reported. Water-white orange blossom18@20c White to water-white sage (subject to production)18@20c Light Amber Mountain (Sage-Buck-wheat)14@16c Light Amber Alfalfa12@14c

WOOL.

The price trend of wool is upward. Much of the new clip is out of growers' hands.

Sacramento 40@50c
San Joaquin, spring clip 45@50c

HIDES.

The Sawyer Tanning Company at Napa, California, has issued a new price list, showing a sharp increase in values. Wet steer and cow hides have increased 36 and 38 cents. Wet salt hides are 10c higher, at 50c. California hides, however, show the greatest increase in value. Dry calf hides have jumped to the record price of 83c, and wet calf trimmed hides to 79c. Large wet salt hides sell for \$10 to \$13 each. The supply of hides is now very scarce.

LOS ANGELES.

Los Angeles, Aug. 5, 1919.

BUTTER.

This market shows an advance in price per pound of 2c since reported last week. Quoted at 57c on July 28th, and going to 58c July 30th, advancing again on August 1st to 59c. The market is firm with good demand and good sales reported. Receipts for the week, 343,800 lbs.

SHEEP—There is a very active demand for mutton sheep. The high price of wool makes sheep growers reluctant to part with their stock, and so prices have slightly advanced on this market.

Cletrac

TANK-TYPE TRACTOR

(Formerly known as the "Cleveland" Tractor)

ROLLIN H. WHITE, the well-known automotive engineer, designed the Cletrac Tank-Type Tractor to do most of the work formerly done by horses and mules—to do it *better, quicker, cheaper—* and to do it *twelve months in the year.*

A million American farmers can profitably use such a tractor.

It does far *more* than merely plow. That is *only the beginning of its usefulness.* It goes right through with the *entire preparation of the seed bed*—from plowing to seeding. And in addition it reaps, binds, threshes, hauls, cuts ensilage, fills silos, saws wood, digs potatoes and does many of the numerous other chores always necessary about the farm.

The Cletrac stands on two long "feet" each 50 inches long by 6 inches wide. And because of this immense "foot" surface it is kept on top of the soil by the same principle that enables a man to walk on snow shoes. This distinctive construction enables the Cletrac to work *efficiently* on wet or sandy soil. It permits it to go over the seed bed without sinking in—and without leaving two tracks of packed down soil behind it. The same principle that made the "tanks" so successful in the mud of Flanders gives the Cletrac the ability to work practically *anywhere.*

The Cletrac is only 96 inches long, 52 inches high and 50 inches wide—enabling it to work up close to trees and fences and making it ideal for orchard use.

But in spite of its small size and compact construction the Cletrac is extremely powerful and will do the

work of six horses or mules—and has a speed of from forty to fifty per cent *greater* than the average tractor. And it will work on side hills and grades where most tractors fail.

The Cletrac operates on gasoline, distillate or kerosene, but is specially designed to use kerosene or distillate.

Service is a vital thing to consider in the purchase of a tractor. If small replacements or repairs are needed you usually need them in a hurry—and you'll find *every Cletrac dealer well equipped to give you prompt, efficient service.* Back of the dealer stands The Cleveland Tractor Company—big, substantial, and permanent—assuring you that your interests will always be taken care of no matter in what part of the country you are located.

In spite of steadily increasing production facilities we are having difficulty in keeping pace with orders. Early ordering is therefore important. Such tremendous possibilities are open to Cletrac owners for making greater profits because of *larger and better crops—* because of the ability to *work the soil at any time desired,* in spite of horse-killing heat—because of the *year round utility* of the Cletrac, that you are losing money every day you are without a Cletrac.

We have an interesting and instructive thirty-two page book entitled "Selecting Your Tractor" that will be sent free upon request. It goes into *your problems—and solves them.* Send for it today.

LOS ANGELES

Everything--Mutton Broth to Cigarettes.

Yolo County soil and climate allied with Greek enterprise and thrift result in a variety of products.

(Written for Pacific Rural Press by W. H. Schrader.)

THE BIG PORK packers who utilize all of the hog except the squeal haven't anything on Chiflakos Brothers of Esparto, large sheep raisers, cheese manufacturers and growers of Turkish tobacco. They embarked when they first came to Yolo county in the sheep business, and while they were successful they were not long satisfied with simply turning off mutton and wool. Some years ago they started milking the ewes, and manufacturing the milk into cheese. They started on a very small scale, but gradually increased their output, both in quantity and quality. They now have a market as far East as Chicago for their delicious table cheese, which they call Feta. This season they have produced 75,000 pounds. The methods followed by the Chiflakos Bros. in handling their sheep are about as follows:

The ewes are bred for early lambing to start in November. All lambing is done under sheds, the ewes being fed on hay. After lambs are forty days old they have green feed and are marketed about March 1st, at which time milking of the ewes is begun, and extends from March to about the middle of June, by which time most of the ewes dry up. In the height of the season over 3000 ewes were milked. For milking the ewes pass through chutes, which lead from small pens, which hold 100 head. They soon get accustomed to it and take their turn like trained soldiers. Still the milking of so many thousand sheep is some job. Fourteen milkers and twelve helpers were required. A good chance for milking machines.

Getting the most out of the valuable sheep manure was their next problem. Selling it to neighboring orchardists for a few dollars per ton was not at all satisfactory. Included in their Esparto ranch was a level tract of several hundred acres of light, loose loam soil, very similar to that on which in their native land is grown the famous Turkish tobacco, which is blended with the ordinary tobacco to make cigarettes. The fact that the climate also is similar, decided them to give the tobacco a trial. Seed was imported from Greece at a cost of \$7.50 a pound. It was planted in hot beds in the month of December and the plants set out in April. Thirty-two acres were planted. Rows were made 18 inches apart with plants 16 inches apart in the row. All cultivation was done by hand, and the plants irrigated three times. The sheep manure was applied by dumping it in liberal quantities into the irrigating water, which spread it all

Gathering Tobacco Leaves

Stringing the Leaves.

Drying the Tobacco.

over the land. Growth was very rapid, and the plants reached maturity in the early fall, as shown in the top photo, attaining a height of from 5 to 7 feet.

Mr. Chiflakos thinks more irrigation would probably have resulted in larger plants, but might have made inferior quality. It is the quality and flavor of the leaf that brings the high prices. All damaged or inferior leaves were sorted out and fed to the sheep. In order that the leaves might be picked at just the proper stage it was necessary to go over the plants four or five times.

After picking, the leaves are strung on long sticks, as shown in the second photo, and hung out to dry in the air, as shown in number three. After the various processes of drying and curing, they are made into bales and shipped across the continent to New York. Bye and bye some of them will come back again in the form of Turkish cigarettes.

The thirty-two acres produced last year over 27,000 pounds, or 850 per acre, and it sold for \$1 per pound f. o. b. Esparto. The total cost of producing the crop is estimated by Mr. Chiflakos at \$225 per acre, leaving a very handsome profit.

Encouraged by their success Chiflakos Bros. have this year planted over 200 acres, while their neighbors, wishing to emulate their success, have 450 acres more. A minimum price of \$1.25 per pound has been promised for this year's crop. This means, if the yield is equal to last year's, a total value of considerably over a half-million dollars. Not bad for a local industry in its second year.

Successfully launching two brand new agricultural industries within a few years is a pretty good record for these enterprising adopted Californians, but they are not through yet. We quote from a letter which we recently received from them:

"We are now preparing to put a new food on the market which will be of exceptionally fine taste and quality. It will be made of sheep's milk, of course. We experimented with it last year with satisfactory results. We are figuring on inviting all our friends in the near future to a dinner which will consist entirely of products of our ranch, even to cigarettes made from tobacco raised on our place last year. We will extend an invitation to you to attend, and hope you will be present."

Everything from the soup to the after-dinner smokes from one ranch. We certainly will try to attend that dinner. Sorry we can't extend the invitation to all our readers.

EDITORIAL.

A GREAT FIGHT ON.

THERE is a fight on this week over the high cost of living which has knocked the breath out of the contention over our national endeavor to fit ourselves to a ready-made world-peace handed down from Versailles. Of course, it does not matter whether or not a suit fits a man or a nation, if there is a question whether he or it can get enough to put in the exact center of the suit to expand it properly. We are therefore not surprised that President Wilson has decided that he will not ride the war-fleet through the Golden Gate, nor will he exhort the people on the league of nations until Congress does something to keep the people from quarreling over grub. And so the House of Representatives has been called back from its midsummer excursion after political suckers—which it seemed free to make while the Senate was giving all its time to politics over the league of nations. It is, of course, rather sad that Congress has to be kept all through the dog-days gnawing over economic bones, while it could so well be wallowing in the nice, cool, clean mudhole of partisan oratory—but there seems no help for it. Some one seems to have discovered that some more fruits and flowers are needed to ornament the tables for the next campaign for national offices, and the current administration, on the one hand, and the aspirants for succession to it on the other, have gone out after decorative munitions. Both will bring back plenty and thus demonstrate once more the resources of this great country for self-government. It is, in fact, just this sort of thing which makes this country safe for democracy. We quite admired the insight of President Wilson when he said the other day, in answer to an alarmist who claimed that we are sitting on a volcano, that there is no danger of an eruption because the American people knew how hot it could get without boiling over and spoiling its clothes. Of course, the President did not use those irreverent words, but, as we remember, such was the sense of it. And this we take it, will be the beneficent outcome of the midsummer madness which is now on us. Some very serious people protest that all this contention is a great waste of time and energy, and that we should be giving attention to less frivolous and more constructive affairs—but you cannot expect to get all the people to be thus coldly calculating. Most of us need to get warm through denunciation to become effective in annunciation—therefore, we say, let the people go to it in the good old American way. It is the way to develop our constitutional patriotism. We had some building to do once with a plumber who could not wipe a joint without cursing his helper clean through the studding of a bathroom. It seemed a fierce waste of time and energy, and yet he was so good a plumber that, with such a stimulus, we believe he could have soldered a stick of macaroni to a rubber hose, if the specifications had called for it. That is the game we are now playing in national affairs. Don't worry about loss of time and energy. From the point of view of national welfare we are conserving both as fast as we can.

WHO IS PROFITEERING?

It is essential to know that, and so the United States Attorney-General is sending his representatives into all the states to push State and national laws against profiteering to their most perfect work. These government agents are now arresting all sorts of people from trustful packers to cashful corner grocerymen. It is a good thing; we hope they can catch many with the goods on them fit for conviction. Their punishment will be wholesome correction for their transgression and the publicity of it will scare others toward fair-dealing. In all the dispatches we have read during the last few days we have seen only one mention of farmers caught at profiteering, and that was a bunch of Hoosier farmers who were squiggling on short-weights of produce they were peddling in the city streets! It seemed strange to balance off this rural sport (though thoroughly reprehensible, of course) against the crimes of multi-millionaire metropolitan food-hoarders and outrageous price-fixers, but when the net is drawn all is fish which comes with it and bull-pouts and sharks must bleach upon the beach together. This nation-wide hunt for profiteers is only beginning as we write on Monday, and possibly this week may disclose some significant captures. This arraignment and the information connected therewith may largely settle the question. In his address to Congress on August 8, President Wilson said:

The purchaser can often take care of himself if he knows the facts and influences he is dealing with, and purchasers are not disinclined to do anything, either singly or collectively, that may be necessary for their self-protection.

The Department of Commerce, the Department of Agriculture, the Department of Labor and the Federal Trade Commission can do a great deal toward supplying the public, systematically and at short intervals, with information regarding the actual supply of particular commodities that is in existence and available, with regard to supplies which are in existence but not available because of hoarding, and with regard to the methods of price-fixing which are being used by dealers in certain foodstuffs and other necessities.

There can be little doubt that retailers are in part—sometimes in large part—responsible for exorbitant prices, and it is quite practicable for the government, through the agencies I have mentioned, to supply the public with full information as to the prices at which retailers buy and as to the costs of transportation they pay in order that it may be known just what margin of profit they are demanding. Public opinion and concerted action on the part of purchasers can probably do the rest.

It is to secure concrete data upon which public prosecution of profiteers can proceed and information which will help the public to protect itself, that the fight against the high cost of living is beginning in Washington this week. Incidentally, of course, the whole question of whether the government shall govern less, or whether it shall govern more, even to the ownership and operation of everything, is involved and, of course, all parties are striving to make their ideas and actions as useful politically as they can.

THE WHEAT MUDDLE.

One of the most baffling affairs at the moment is the fixation of the price of wheat. City reformers point to it as the cause of all food-price troubles, because "other foods have to keep up to it." Rural reformers are protesting against price-fixing as unfair in itself and causative of other losses to them. It is, of course, arbitrary and unreasonable, and therefore might be reasonably charged with all sorts of ill-effects. Some protest against it for its inherent influence; others charge most serious offenses in its administration in the way of more advantage to urban handlers than to rural producers. Mr. Hodges has in several past issues stated the California aspects of its operation, and the Farm Owners' and Operators' Association announced in our last issue that it would go after both the fact and the administration of it, with hammer and tongs, at a mass meeting in Stockton next month, if the growers desire it.

In the Mississippi Valley and eastward there has been strong and continuous agricultural opposition to the fixed price for wheat. On August 8 there was a hearing before the agricultural committee of the Senate at which several Republican senators hit the wheat price as they might perhaps be expected politically to do. In addition to such pos-

sibly actuated utterances, however, there was a declaration from T. C. Atkeson, Washington representative of the National Grange, to these effects:

The \$2.26 guarantee was intended by Congress to be the minimum price with a higher price possible under the law of supply and demand. Instead, the United States Grain Corporation had made the minimum guarantee the maximum price for the farmer.

The farmer will receive an average of only \$1.50 per bushel for wheat this year. Had the Government not fixed the price farmers would receive much more than the guarantee because of the prospective wheat shortage and world demand. The Grain Corporation had made large profits from wheat sales that the farmer should have received.

Other representatives of farmers' organizations told the senate committee that the guarantee is not an aid, but a detriment to the farmer, and argued for its repeal, but the committee deferred action.

AN ANGLO-AMERICAN QUESTION.

We hold that fighting among ourselves is a normal American indulgence, and it makes us healthy sociologically and otherwise, but other nations do not always seem to like our way. It seems that an association of four hundred film exhibitors in Great Britain has decided unanimously to fight the project of a wealthy American film-producing corporation which intends to install picture-houses in Great Britain. This fact is not important, for it is to be expected that one bunch of show men will fight another, but it seems that a great international moral question is involved. The British allege that there is much danger of the tight little island being shot up unless American gun-work is banished from the screens. It is alleged that a great number of boys and youths have been brought before the magistrates for re-enacting in real life the modes of assaults and burglary which they claimed to have seen "at the movies." They propose as a relief from American pernicious suggestions that truly British films should prevail and that fisticuffs and the "manly art" be substituted for the shooting way of deciding differences, American fashion. We have to admit that there may be a good deal in it from the point of view of instilling nobility of action and the value of life-saving throughout the community, but reformers should remember, of course, that it musses up the actors dreadfully to put a realistic piece of fist-fighting on the screen. It is possible that American kids are immune to the shooting fever and possible also that it might be troublesome to fathers and school teachers if they should be shown too much about fist-fighting! Probably each nation should choose its own recreations and not try to make a league covenant about it.

SALT FIT TO BE CAST OUT!

It is about the right time of the year to get some visionary meteorology from Oregon, and we judge from the comments of a contemporary, who has a keen appetite for that sort of thing, that it is arriving. The report is that a local scientist has submitted to the Governor of Oregon a proposition to "induce rains to fall and extinguish forest fires by sprinkling salt through the atmosphere from airplanes. The theory of the proposer is that the salt, because of its well-known attraction for dampness, will condense to rain the moisture in the air." It appears to us that no matter how theoretically reasonable the proposition may be, and our contemporary is disposed to consider it very much so, there are two facts which stands more or less in the way of it. First, at the time of the year when it is proposed to apply the salt, there is too little moisture in the air, even in Oregon, to cause a rain—granting that the salt could grab all of it. Second, if there were plenty of moisture in the air, and you could shoot salt enough to condense the moisture, the salt would come down with the rain and kill every green thing on the face of the earth—including the originator of the theory, unless he is a mackerel. Common salt is one of the most active killers of land plants we now of. It is even worse than alkali, and what we call "alkali" is most deadly because of the common salt which is associated with the other sodium compounds. The beneficent thing about rain water is that though most of it comes from the ocean, the sun is not able to pull out the salt with the water, and beyond that lies the other fact that the ocean is salt be-

cause the sun is not able to pull out even the infinitesimal quantity which runs in with so-called "fresh water," and therefore it has accumulated there ever since the flat went forth that the waters be "gathered into one place." Now, if it were possible to gather the waters out of the atmosphere with a bait of common salt, it would put the land back again where it was before the rains had washed out salt enough to enable Adam to start his garden. Even though the Oregon idea be reasonable, or even its reduction to practice feasible, we do not care for it.

QUERIES AND REPLIES

By the Editor.
Inquirer Must Give Full Name and Address.

Growing Cross-Bonds in Fruit Trees.

To the Editor: One of our local papers contains an account of a way a Hollander workman is obviating the use of props or cross-wiring on the Shaner orchard in this vicinity. The method consists in twisting together shoots growing on limbs on opposite sides of a tree, or from a central limb, so that any two limbs can be tied together, or every limb be secured to another to make a practicably unbreakable tree. More than this, on some of Mr. Shaner's trees a large part of the crop was on the short, twisted branches, and they were the ones best fitted to carry the load. The twisting binds the bark and causes the fruit to develop there instead of the ends of the branches. On all the twisted branches the fruit was remarkable both for quantity and size. What do you think of the proposition?—Reader, San Jose.

The way of supporting branches by inter-weaving of laterals, which you describe, is an old European practice and has been commended by horticultural writers in this country for half a century and more. It is perfectly feasible and reasonable, and has been practiced by a good many people having a few trees—a few samples having been visible here and there in California ever since Americans began to grow fruit. It is, however, appalling to think of the amount of labor and personal attention which would be required to fix up trees that way by the acre and that is probably the reason why a rational thing which so many fruit growers know about has never entered into prevailing practice.

Covering for Bark Beetles.

To the Editor: What is the most permanent preparation and the most effective for painting my four-year-old prune trees? The trouble seems to be bark beetles. The bark peels off and has a brown, dusty substance behind the bark. Should all loose bark be cut off before preparation is applied, and could white lead be used with crude carbolic acid, or would this be too expensive? Lime, blue-stone preparation is washed off very soon by rains.—N. A. R., Banning.

If the bark is loose and underlaid by the litter of the insect, the word underneath is also dead, and we know of no harm that can be done by covering such dead parts with white paint. Insecticide quality could be had by incorporation of carbolic acid—which could be most easily done by carbolating the oil with which the paint is thinned. We should prefer, however, to use a carbolated wash all over the old bark of the tree as well as the dead part—using a pint of crude carbolic acid to ten gallons of whitewash—for this would be preventive of invasion of bark not yet occupied by the pest. To be strong and effective, fresh application should be made two or three times a year—for instance, now, next October and next spring. One must not hope for permanent protection against pests; he must keep everlastingly at them.

Second-Growth Millet?

To the Editor: I send some seed-shoots of millet. The seed was put in with a grain drill about six weeks ago. The ground was well watered when seeded and all of the seed came up finely, but as it got dry on the surface it started to fall over

Increase Your Income.

Are you looking for a better position? If so, be sure to investigate the work in our circulation department. If you like to travel and interview people you will enjoy it, and the remuneration will satisfy you fully.

Lack of experience no barrier; we give you proper training and bang-up support. No investment necessary, but you must have an automobile.

Write us about your qualifications and experience, and let us tell you about this opportunity for ambitious, energetic men. It will interest you.

and dry up. We put water on at once and now it is sending out roots from the stump again. Was this caused by something in the soil or is that the way that millet grows?—J. R., Chowchilla.

There are seedling shoots coming apparently from the root crown of the old plant—though our correspondent sent us only the shoots and not also the part of the old plant whence they are growing, which we would have liked to see. The fact seems to be that the first growth suffered from surface drying and was blown over as the straw was too brittle to stand up. The root, however, retained moisture enough to keep alive and the new water started growth in the root, which had to make new shoots because the natural top could no longer take sap. It seems to us just like the second growth from hay stubble, when cut the root is active and plenty of moisture to go on with.

Who Has Non-Fruiting Mulberry?

To the Editor: I have a Mulberry tree some 30 years old, with a 2½-foot trunk. The shade from August 15 on is grand, but the berries for 2 to 3 months previous are a nuisance beyond description. What variety of shade tree may be successfully grafted to this top, which will give a clean tree and nice shade?—W. M. S., Biggs.

We know of nothing you can graft upon a mulberry but another mulberry. It is a fact that some varieties are very scant bearers, but we cannot advise you which. So much effort has been put forth to get varieties prolific of fruit that the opposite habit has been obscured. Some of our readers may have such trees and can perhaps offer scions which you can use. Unless such are available our advice is to keep such fine trees as they are to feed the birds. If it is convenient you can keep your walks clean by having a few fowls and giving them a short run every day during the fruiting season to clean up the berries of which they are very fond.

Old or New Wood on Roses.

To the Editor: How about new rose shoots from below. Should they be cut out if there are enough stems already? Or shall I cut out old branches and let the new shoots grow up from the roots? A well-formed bush sends up several new shoots, and I do not know whether they are better than old canes or not.—R. E., Butte City.

If the bushes are just being formed and the wood rather new and of good strength, remove the suckers as soon as you see them coming. If the old wood has seen considerable service and rather too weak to send out vigorous shoots on cutting back—select the strongest and best-placed suckers and make a new bush out of them. This is only good advice for bushes on their own roots—that is, grown from cuttings. If they are budded roses be sure, of course, to extirpate all shoots that start from the root and train the shoots which you are sure come from above the bud-point.

Walnuts Failing.

To the Editor: I have three French walnut trees about ten years of age bearing. This summer the top limbs are dying, bark falling off, leaves drying up and falling, nuts falling off. What is the trouble? Is it blight? And is there anything I can do for them?—Subscriber, Los Molinos.

It is not bacterial blight—that is the common blight of the walnut. The nuts on the first to show the effect of that. The die-back usually indicates trouble below ground though as you speak of "bark falling off" there may be some sunburn involved in it—which attacks nuts, leaves and bark also. Ask some fruit grower whose wisdom you respect to look at the trees for you or call in your farm adviser, E. W. Curtis, whose office is in Red Bluff.

California Weather Record.

The following rainfall and temperature record is furnished the Pacific Rural Press by the United States Department of Agriculture Weather Bureau at San Francisco for the week ended August 12, 1919.

EIGHTH EDITION

“California Fruits

and

How to Grow Them”

By E. J. Wickson, A. M.

Every fruit-grower, as well as those intending to plant, will be interested in this new edition of the standard book in Horticulture. Prof. Wickson has been busy for several months in revising the eighth edition that is now in press and which will be ready for distribution by October 1st.

The book will be cloth bound, handsomely printed and illustrated, on good paper. Will contain over 500 pages besides illustrations. The price will remain the same as previous editions—\$3 per copy postpaid.

ADVANCE ORDERS SOLICITED.

Pacific Rural Press, Publisher

525 Market St., San Francisco.

How Much Does Your Tractor Deliver?

Written for Pacific Rural Press by R. E. Hodges.

"WHAT IS THE RATED HORSEPOWER of your tractor," asks the interested farmer when a salesman puts his foot on the old horse-plow.

"How many plows will it pull?" asks another farmer.

"How many inches of plows will it pull this deep?" asks another.

"How many pounds will it pull on the drawbar?" asks another.

"How many pounds will your tractor pull on the drawbar at plowing speed, and what do you call plowing speed?" asks the man who really knows what he wants to know.

How Much Does a Horse Deliver?

Every farmer knows about how much work his horses can do when the weather is right, and generally he can tell whether the work is taking flesh off from them if he watches closely for a long enough time. But if he asks a tractor salesman, how the tractor will compare with his horses, the salesman, or the head engineer of his establishment, could not tell with precision and should only guess at it. The horses' days' work varies with the weather, with the weight of the horse, his health and condition, on the temperament of the driver, and on the rush of the work. It is no fair standard of comparison because so much variation exists in the standard.

Mechanical Power Is Definite.

But the mechanical horsepower is a fixed amount of power which a Chinese engineer would figure the same as an American. It depends on two factors, the pounds pull and the speed with which the pounds are pulled. It is the equivalent of lifting 33,000 pounds a foot in a minute. When applied to tractors, endwise pull is figured as equivalent to "lift."

When you know how many pounds a tractor pulls at a given speed you can quickly figure how much mechanical horsepower it is exerting. If you should tell a man in Australia ten years hence, he would know exactly how much the tractor had pulled and could reproduce the same power in another machine. This makes an exact basis for comparing the power of tractors when the tractor men will

give you certified figures.

Pounds Pull of Tractors Is Known.

Such figures have been determined by actual test on most tractors under observation and supervision of State Experiment Stations or officials of the American Society of Agricultural Engineers. Of course, such tests are made under favorable conditions, the machines being "on their metal," and the traction surface being solid.

It is always necessary to notice the speed at which the tractor was moving when it made the test, for the tests themselves have not yet become

tage in the future, but the plowing speed of most tractors is designed to be about equivalent to that of horses. The up-to-date tractor buyer will ask what the tractor will pull at the speed he wants it to run.

If a tractor plows faster than two miles an hour, it does more work and exerts more horsepower on the drawbar even though the depth and width of plowing remain the same.

Tractor Ratings Not Comparable.

The writer has taken the trouble to figure out the actual horsepower exerted on the drawbar at plowing

most invariably overloads his tractor often without knowing it. The conservative rating makes the first sale harder to make, because this tractor is not claimed to deliver as much power as a cheaper one.

But the second sale of such a manufacturer is always easier to make to an observing tractor user because the upkeep expense is so much less on a machine that does not have to be continually strained to deliver its rated horsepower.

Not Only Power, but Traction Also.

Another feature in this connection is of great importance. A tractor may give the desired pounds pull at the desired speed in a test where it has good traction, but if its track or lug equipment are not suitable for the mud or sand or rocks or adobe on the farms where it is to be used, bona fide power will be wasted. The writer has watched tractors closely at all of the major California demonstrations and has found that probably 90 per cent of them have power enough to the engine and strong enough transmissions so they can spin their wheels or slide their tracks if hitched to an excessive overload such as they get when the plows hit a hard place or the tractor hits a soft place—ah, there's the rub!

We have lots of soft places of various kinds in California, including dust knee-deep or less on roads heavily traveled with loads of grain at harvest time. The truck length, width, and corrugations or the wheeling equipment are designed to meet average good traction and to permit slipping if an excessive overload is put on. This protects the engine from a great deal of excessive strain which it would get if extra lug equipment or track extensions were used on good traction surfaces.

So the inquirer for mechanical draft stock may well look for standard equipment to suit average conditions and extra equipment conveniently put on for emergency conditions only. Then he may be glad when using proper traction equipment if the engine is powerful enough to slip the wheels or tracks rather than strain the engine.

It pays the tractor buyer to know how many pounds a tractor can pull at the drawbar on good traction at the speed he prefers for plowing. This is a more satisfactory way of buying power than to depend on manufacturers' rated horsepower, which varies in different makes both above and below what the tractor will actually deliver.

standardized in that respect, and various tractors are geared or governed to plow at speeds varying from 1½ to three or more miles per hour.

Decide Your Own Plow Speed.

"What is plowing speed," is a necessary question to be settled in one's own mind. This will vary with the type of plow, the type of soil, and the condition you want it left in. Fast plowing will turn soil better with the same plow and will break it up finer, but this is not sufficient proof of the desirability of fast plowing.

We are accustomed to a speed of about two miles per hour for plowing. Various changes in implements may change this speed with advan-

speed on a score or more of tractors and we find that the published ratings of many of them are based on a faster speed than is ordinarily used in plowing. This, of course, enables a tractor of small power to rate itself as of equal power to a bigger tractor, which plows at a slower speed.

Conservative Ratings Best.

On the other hand, a goodly number of tractor concerns have rated their machines considerably lower than they would be entitled on the basis of two miles per hour and their actual pounds pull on the drawbar.

These are the conservative concerns who accept the fact that a farmer al-

grade raisin, is to be done automatically. Electricity provides the power, and when the one step in the process is completed, the raisins are carried along by belts or drapers of various types to the next portion of the plant.

Vastly Improved Packing Plant.

For light, airiness, cleanliness and beauty, there is as much difference between this plant and the old-style, barn-like packing-house that lines the railroads in the raisin district, as there is between the stage coach and the mail airplane as a means of conveyance.

When all is said and done, it is attention to every detail that brings success. Until the recent boom of seedless varieties, raisins were Muscats, and for year to come, possibly for generations to come, seeded Muscats will be the standard cooking raisin. But whether that is so or not, the use and market is bound to increase now the growers do their own marketing, and there is nothing like the kind of plant at present being erected to make the demand grow.

SHALL I JOIN THE ASSOCIATION.

To the Editor: Please advise me as to what walnut association to join; i. e., the one nearest. Also whether or not it would pay me to do so, having but 1,000 pounds of nuts.—A Reader, Paso Robles.

Your nearest local is the one at Goleta (Santa Barbara county). Unless you are peculiarly well situated with a private market it would pay you to join the association even for this small amount rather than fix up to grade, bleach and market it yourself.

Co-operative Selling Improves Raisins

(Written for Pacific Rural Press by D. J. Whitney.)

about picking at the right time than ever has been done before. Any definite figures as to the improvement in the raisin output as a result of this work are impossible to get; there is too much difference in seasons and other features of the industry.

Rivalry still exists between paper and trays for drying. Trays win on merit; paper on economy the way trays cost, with wood the best in the long run for every raisin grower that can afford it and for growers as a whole. Sand that works onto paper dried raisins are no help to them or to packing-house methods.

Driers for Emergencies.

Artificial driers make the important outlook in the raisin industry. If a couple more bad drying falls come, artificial driers will spring up like mushrooms over the Fresno district. The old-fashioned 2-cent raisin of competitive days could be used profitably for pork provided rains spoiled them for processing, so artificial driers under those conditions seemed to be too expensive insurance to bother about—particularly when surplus cash was a curiosity with most raisin growers, but now that raisins are worth several times as much and sufficient funds to provide artificial drains are available, the case is altered entirely.

Where the raisin company has done its great work, aside from marketing, has been in putting out good stuff and nothing but good stuff—standardiza-

tion all over again. To put in cull and half cull raisins in the long run is like shipping green, pucky table grapes, filling the bottom of a box with small fruit, or selling stove-pipe potatoes—the temporary gain may seem profitable, but the true outcome is disastrous. It is like robbing Peter of a dollar to pay Paul a dime. The Associated could afford to sell hundreds of tons of cull and half-cull raisins to make pork, and yet to take in more money for the crop than if everything at all possible was shipped for human use, and the continually increasing market and satisfied customers has more than justified the practice.

Half a Million for Seeding.

What no private company could have done is being done now in the erection of a half-a-million-dollar, reinforced-concrete structure, a thing of beauty and a source of pride, for the direct purpose of turning out seeded raisins. Every seeded Muscat raisin, except those produced and packed in Kings county, at the Hanford house, will be packed in this house, by the most modern devices that can now be designed. From the time that the raisins are delivered and dumped out of the sweat boxes until they get into the cartons, and the cartons are ready for the shipping cases, no human hand will touch them. Stemming, cap stemming, cleaning, sterilizing, culling, seeding, and packing into the cartons, everything needed to produce the highest

THERE is no denying the fact that one of the big things in the co-operative marketing of farm products comes from the production and processing of better material. The middleman packer frequently may put out goods containing as much poor material as he thinks can get by and stand the competition of other packers who feel the same about it as he does, but the final good of the markets calls for just as fine a product as can be turned out. Thus, although the greatest success of the California Associated Raisin Company has been due to co-operative marketing, the gathering up of loose ends that were a drag on the industry in curing and packing has been an immense help.

Best Method of Curing Raisins.

As to the curing, Noah's sons, in the part of the world that stands second to California for raisin merit, when they decided that raisin grapes were better than wine grapes for humanity, probably landed on the simple, efficient and excellent way of drying that has remained standard from that time to this: their raisins were sun made, or "Sun-Maid," which seems to be the correct spelling at present.

There have been a few things that the Associated has been able to do even in the curing. Growers always could have known the best time to pick their grapes, but they did not always know it or practice it just the same. Muscats are just right to go on the trays when they test 24 per cent sugar. Since the Associated controls practically the entire acreage and is in close touch with all growers, it has been able to do more to bring

Bud Variations and Strains of 'Deciduous.'

Written for Pacific Rural Press by John J. Fox.

AT THE May Fruit Growers' and Nurserymen's Conventions at Riverside, one of the engrossing subjects of interest was that of bud-variations and selections for the best types of existing varieties. We met a prune grower from Napa County who had left his work to attend the convention for this one subject alone. This grower, Henry Holden, claims to have five distinct types of French Prunes in his orchard—so distinct is shape, size, coloring and quality that they may be said to be separate varieties. As a result of his informal address to the assembled Nurserymen, a committee has been appointed, composed of nurserymen and growers, together with the Horticultural Commission, University of California, and Prune and Apricot Growers' Association, who may decide on the most desirable types to adhere to and improve and which nurserymen will select in future. It is a vast subject in embryo and may perhaps grow and become efficient under the combined thought and action of practical men until it becomes crystallized in practice under definite rules, embracing all varieties of commercial fruit. The deciduous fruit experimenters will take it up.

The Variability of Deciduous Fruits.

Professor A. D. Shamel of the United States Department of Agriculture, in his address told us that the Chesebro apple is a sport of the Northern Spy. The Black Ben, Gano, Arkansas Black and others are propagations of Ben Davis variations. The Red Gravenstein came from a limb sport of the Gravenstein. The Thick-nose Bartlett and other strains are bud variations from the Bartlett. The King Grape is a sport from the Concord. Early Elberta and Late Elberta and other strains are bud-variations from Elberta peach trees.

The Professor believes that the J. H. Hale peach is a bud sport of the Elberta. In many cases that he investigated of new varieties he found that the originator had found a tree in his orchard different from its neighbors, and immediately jumped to the conclusion that it was a seedling in which the bud failed to grow. In

THE COMPARATIVE VALUE OF STRAINS.

"THE VALUE OF THE VARIOUS STRAINS of our fruit varieties depends upon the quantity, quality, uniformity, regularity and season of production, and freedom from causes of loss of the crops of fruit borne by the trees of these strains. Obviously, the quantity and commercial quality of the crops are primarily important factors. The importance of the uniformity of the production of the trees in a strain is not so well understood or appreciated. The uniformly heavy production of superior commercial crops by all the trees in the strain is the object toward which our work for the improvement of fruit varieties and strains is directed. Strains of a given variety often differ in the regularity of their production and in the season when the crops ripen. A regular-bearing strain producing crops every normal year is an important factor in profitable fruit production."—A. D. Shamel.

some cases this was the truth, in others it was not. In most cases the valuable variable trees found have originated from bud selections. The Professor was most emphatic in his plea that bud selection should be practiced to improve existing varieties that are commercially valuable rather than in hunting something new and untried.

Trained, Careful Bud-cutters Necessary.

It was suggested by various men that bud-cutters naturally drift to those trees where it is easiest to secure good long bud-sticks with the least trouble. It is well known that generally, trees and vines that run heavily to wood growth do it at the expense of fruit production. These strains are the ones where bud wood is most easily secured and where it is often the least desirable. Budwood should be chosen from trees of known bearing qualities of good quality and not taken from young untried trees as is so often done.

If the plans outlined or suggested are followed closely, in the future buyers of nursery stock will enquire as to the origin of their stock and may later even be furnished with an association certificate as to its bud source and record. It may even pay to cut certain trees for wood without changing their character, though that is untried.

Elimination of Poor Strains.

One result of united action by the Associated Nurserymen and Growers

will be the elimination of poor strains of all fruits from new orchards. It will also result in additional confidence on the part of the buyer of nursery trees and an ever-increasing tendency to improvement by careful selection. Bud-cutters must be men of judgment and undoubted single-mindedness of purpose. The trees which bear a certificate of guarantee would doubtless bring the extra money that the cost of such care would warrant.

With the development of bud-selection it is thought that origin and quality of stock will enter into market value more than mere size and vigor in appearance so long as they are thrifty. It is understood that there is still much to learn in this matter.

The committee on investigation for establishing types and selection on prunes consisted of the following men: Leonard Coates, Morgan Hill; Geo. C. Roeding, Fresno; A. L. Wisker, Grass Valley; H. A. Hyde, Watsonville; J. E. Bergholdt, Newcastle; Wm. Kirkman, Fresno; University of California; the State Horticultural Commission and the Prune and Apricot Growers' Association.

Selection of Types and Buds.

After the most useful types of the varieties of prunes has been decided upon, the selection of trees from which to cut bud-wood will be perhaps one of the most difficult problems to deal with. For this purpose an intimate knowledge of individual tree performance is necessary. Until records have been made over a period of years this is out of the question. For growers

have not had the time or occasion to keep such records. Therefore a general knowledge will have to be relied upon. The committee will probably begin its field investigations in August when types can be established and growth noted under this year's conditions. Later all contributing conditions to production on marked trees can be recorded and provision made for bud-wood to be delivered through a central agency. That is the general outline. It is a big job and will need trained men.

Growers' Observations.

Before official cow testing came into vogue most dairymen thought they knew their most profitable cows. The tester has eliminated unsuspected "boarders" from the herds. It is at present out of the question to keep individual tree records on orchards that are operating on a large commercial scale, but we can work down to types after standard strains have been established. We noticed some years ago in one growers' orchard a cross cut into the bark of some prune trees, leaving a permanent and conspicuous mark. On asking the owner the reason, he said: "Those trees bear 'lady-finger' prunes in clusters like grapes. The leaves droop and the fruit never really matures so that they will drop without being batted off. I make that cross so that I can know them and hit them hard at pruning time. It helps them to size up."

Here is another factor to be watched for. But probably every grower knows these stick-tights. Growers generally also know their best trees—especially their best types. They will be able to help the committee with what knowledge they have, in the absence of absolute records. And it won't cost much to mark a certain number of trees in any orchard for term performance and condition, and carefully record the results.

It is easy to see that when more scientific and accurate means are taken by all propagators to secure only approved bud-wood, then length, caliber and price will not be the only governing factors to the buyer. It will eliminate the irresponsible cheap tree peddler.

The Standardization of the French Prune.

Written for Pacific Rural Press by Henry C. Holden, Prune Grower, Napa.

NOW, if the matter of size did not enter in as such an important factor, it would not be worth while to bother about the different varieties of French prunes, for varieties they certainly are, and not merely slight bud variations, as sometimes occur. There is a distinct variation in form, texture, color, and lastly in size, which is more important than all other variations.

Variations in Size and Value.

There is a variety of French prunes that will produce a large percentage of 40-50's even with a heavy crop, and will run 35 with a small crop. There is a variety that will produce 80-90's with a heavy crop and 70's with a light crop. There are more or less intermediate varieties that will produce 50-60's under favorable circumstances.

This year we have the highest premium ever paid for raising the large French prune: \$40 a ton extra for 40-50's and \$80 a ton extra for 80-90's. Besides this there is \$20 to \$40 a ton extra, which is the normal reward for raising large prunes; and occurs in direct ratio to the base price. So, if there is this premium for large prunes there is likewise a corresponding penalty for raising small prunes.

Cultural Methods Do Not Change Varieties.

You may fertilize, you may cultivate, you may irrigate the small variety of prune and you will not get one pound of 40-50's from them, no more than you would get a Mammoth

ARE ALL FRENCH PRUNES alike? Everyone who grows French prunes knows they are not. Some trees bear large prunes and some bear small ones. Some are reddish in color; some are blue; some dry quickly; some dry very slowly. Usually the grower accepts all these conditions as an act of God and harvests alike his prunes, big, small, and indifferent, and lets the grader say what he shall receive per ton.

blackberry from the Himalaya bush. On the other hand you may neglect your orchard so that all the prunes will be comparatively small regardless of variety. Of course soil conditions and the root on which the tree is budded or grafted also affect the tree, and the size of the fruit, but the varieties remain as distinct under all conditions. The tests that we have are with vigorous trees on Myrobalan root in one orchard where the soil conditions did not vary. Every orchard examined contains a mixture of all varieties. Some of the older orchards running heavily to small prunes and some of the younger orchards having a large percentage of the large prune, but we have not seen a true stand of any one variety.

Losses by Planting Poor Varieties.

Some attempt has been made by the Nurserymen in the way of selection, and this is very marked in some of the young orchards in Napa county, where in some cases 90 per cent are of the larger variety. Now, then, how much are we losing?

Figuring 25 per cent of a 200,000-000-lb. crop, we get 25,000 tons at \$40 per ton loss, equals \$1,000,000. We should say the loss is actually about

double that figure, but a million-dollar loss is sufficient to make it apparent that this should be corrected so far as possible.

Standardize Varieties.

It is up to the prune grower to establish this large variety, standardize and name it, and make it possible to purchase trees of this variety as easily as the Gravenstein apple can be bought.

Now is the time to observe your trees, just as the prunes are coloring. The small prunes color earlier and are smooth. The large prunes are lumpy and still growing. Also, the trees bearing the small prunes have a peculiar wilted appearance, many leaves showing the under side.

Practical Suggestions.

In drying, the small prune is more solid in texture and dries very slowly. Young trees may be grafted over with profit, but with these abnormal prices ruling, it would seem advisable to let old trees remain, for the time being, as they are. We may insure all future plantings if the proper steps are taken to isolate an orchard, work it over to large prunes and use it from which to obtain buds. Of course, these trees would be heavily cut each year

to obtain a maximum of bud wood; but this heavy cutting would not change the inherent character of the variety.

The distribution of these buds would naturally come under the supervision of the Horticultural Commissioners and their certificate should be a guarantee to the purchaser that the trees of this variety are being procured. We all want to grow mammoth French prunes and not "petite" prunes, as they are called in France.

The committee have collected a large amount of data in regard to these different varieties of French prunes and they would be glad to receive any additional information from growers who have made similar observations.

(Mr. Holden is chairman of the Horticultural Committee of the Napa County Farm Bureau, and addressed the Nurserymen's Convention at Riverside at their request. He is a successful prune grower at Napa and keenly interested in the industry at large.—Ed.)

The sale of the first car of Thompson Seedless grapes shipped this season from North Dinuba brought \$3,241, or from \$3 to \$4.60 a crate, in New York. A few crates of Wickson plums included in the car brought \$2.60.

The tonnage of peaches sold by the Tulare County Growers' Association will approximate 6,000 tons.

Dusting Prunes and Almonds for Mites

(Written for the Pacific Rural Press.)

Spraying against mites and red spider in the early spring is coming more and more into practice each year with almond and prune men. But this year of grace more dry sulphuring and dusting has been done in the orchards than ever before. The high prices in sight have more than ever made men realize that it is not safe to overlook a single bet.

In the San Martin, Coyote, Morgan Hill and adjacent districts, where these mischievous mites nearly defoliated some orchards by August last year, the trees are full of leaves that carry a good color. Growers here have been dusting with sulphur and sticking to it. Scores of dusting machines have been bought in this valley this year and both foliage and fruit are reflecting the thoroughness of the work done. For it has been done well and then repeated where the best results show.

A Notable Example.

E. B. Stone, who has a magnificent 20-acre prune orchard in the Moorland district, showed us one small spot in his orchard that was badly infested with red spider last year. For some reason it is a little wet and is not fit to plough till perhaps 10 days later than the rest of the land. As a consequence of last year's infestation there is a very light crop on these trees, while the rest of the orchard carries a heavy crop. The trees are very even in size throughout the whole orchard—are well pruned so that there is a good set of fruit even in the centers of the trees. Last year, on the red-spider spot, half the foliage was off the trees by August 15, so the condition of the rest of the leaves can be imagined. This is just the time the trees are maturing their buds for next year's crop, so the lowering of the vitality of the trees by such a loss cannot be calculated.

Trees Clear of Mites.

When we saw the trees July 22 they had been dusted then and a month ago. The trees were clean and in excellent condition in every way. Mr. Stone used a Kansas No. 4 duster—worked with a racket attached to his wagon wheel like a grain broad-caster, and

he dusted 10 acres a day with it, using four sacks of sulphur to the 20 acres. Under good conditions he claims he could far exceed this. He will probably have 80 tons of dried prunes from this 20 acres and they are going to run to large sizes.

Cultural Management.

Mr. Stone irrigates twice a year. He grows a heavy cover crop and allows it to mature before turning it under, replacing the loss of moisture by applied water. He also applies half a ton of mixed fertilizer to the acre containing Phosphoric acid, 15 per cent, and Potash, 5 per cent. Last year he applied one ton of Hydrated lime to the acre.

Example at Los Gatos.

Stanley B. Smith at Los Gatos had quite a bad infestation of red spider, and we saw his trees a couple of days after he had finished dusting. He has 27 acres mostly in prunes and apricots and he had used an American Beauty hand machine to good purpose. About 10 to 15 pounds of sulphur to the acre is enough. We could see many dead mites on the leaves and saw one or two new hatched ones—one just emerging from the egg. Mr. Smith is well pleased with the results he has obtained and realizes the importance of vigilance to keep the little insects good and dead.

Worst Infestations on Almonds.

The worst infestations show up on almonds. Already one can see trees waving a few pitiful little leaves like the ragged distress signals of a shipwrecked sailor.

How can such trees be expected to set a crop next year? They can't even make wood except maybe a few suckers inside—a forlorn attempt on the part of the tree to keep things going. Almonds in the right districts pay and pay well—if they are taken care of. But this one thing must be remembered—the mite is the worst enemy of the almond. It must be fought regularly and persistently before the damage is done. Fight or let somebody else come. And it has got to be done every year and be looked upon as of the utmost importance till the pest is in abeyance.

The Approaching Shipments of Grapes

(Written for the Pacific Rural Press.)

In reply to our enquiries regarding the shipments of the table grape and wine grape crops this season, J. L. Nagle, general manager of the California Fruit Exchange, gave us the following replies:

"If weather conditions permit, we anticipate that the total shipments of grapes packed in kegs and drums this season, will be approximately 500 cars. This will represent about 8 per cent of the shipment of table grapes. We have no reason to believe that the sawdust supply will be inadequate."

"We believe that the shipments of

table grapes in what is known as the 25-lb. lug will be heavier than last season. This particular style of package is popular in large cities, but has not been adopted generally by the smaller markets as the buyers contend that it is not a re-shipping package."

"The shipment of wine grapes depends upon three things—the supply of lug boxes; the feeling the buyers as to whether or not the manufacture of wine by the consumer will be interfered with by the Federal authorities, and the car supply."

DON'T SHAKE THE TREES FOR BEST RESULTS.

(Written for the Pacific Rural Press.)

Prunes.—The sugar, the weight and the quality of your prunes is only attained in full when the fruit is dead ripe. If the trees are shaken before the last picking you are losing maybe up to 10 per cent in weight alone. The prunes look large and full, but how they shrink away in the drying when they are filled with a sap not yet sugared up. Let them drop, even if picking does cost you a little more money. Every extra pound of large-sized prunes pays for picking up a box. Go after that pound. It's those "puddeny," dead-ripe ones that weigh like lead—that dry away 2 to 1 instead of perhaps 2½ to 1.

Peaches.—Labor is high. You said it! But that is no reason why you should shake those Muirs off into a sheet to cheapen the picking. Because maybe a third of them are not ripe enough to cut, and you know it. Go round those trays when they come out of the sulphur house and see what a lot of dead-white ones there are instead of the deep, golden yellow that ought to be all over the tray. You have lost weight there and your association loses quality. Taste one.

Raisins.—You can't shake these but they must be left to get real ripe. They should show a test of 24 degrees of sugar (Ballings) before picking. The difference between 19 degrees and 24 degrees sugar is 131 pounds of raisins to the ton of green fruit. Can you afford your impatience to throw that away. Thirteen hundred pounds of raisins to every ten tons of grapes gone to blazes. Let 'em hang and make your own tests for sugar.

"At the present time we anticipate a car shortage and if this develops it is not unlikely that certain shippers directly interested in the table grape industry, will enter a protest with Washington to embargo the movement of wine grapes if the shortage of cars affects the movement of table grapes."

PEARS IN LAKE COUNTY.

Fred G. Stokes, Horticultural Commissioner, states in a report on July 21: "Our pear crop is looking A-1 and the fruit is sizing up fine, though the present warm spell is checking their growth some, but two weeks ago we had a cool week or so and they certainly did get bigger than they were at the same time last year. Most of our orchardists have put on more cultivation than usual, and just now many are strawing their trees, which answers the double purpose of mulching and provides a soft bed for any pears which may fall, also in the case of adobe ground it is good to plow under in the fall or spring. We expect to begin pear picking in about two weeks' time."

Most of the pears will be dried, and the California Packing Co. has purchased land in Scotts Valley. They have almost completed their new dry yard and bought many crops in that section, paying all the way from \$55 to \$80 a ton orchard run. As much as \$85 a ton orchard run has been paid this year, and there is keen demand for Bartletts. Many companies did not get what they wanted of Lake County pears owing to the fact that many of our growers were tied up

by previous contracts. Next year it looks as if there will be a very lively competition for Lake County pears, as many of the long-term contracts will run out and the demand for our dried pears is brisk at big prices, the highest offer being of late 22½ cents a pound f. o. b. Lake."

ARCADIAN

Sulphate of Ammonia

A ton of ARCADIAN Sulphate of Ammonia carries more plant food than a ton of any other nitrogenous fertilizer.

ARCADIAN Sulphate of Ammonia is the well-known standard article that has done you good service in your mixed fertilizers for years past. Especially kiln-dried and ground to make it fine and dry. Ammonia 25¼%. Made in U. S. A. Arcadian is the great American Ammoniate.

For sale by all the principal dealers.

The Famous Hardie Junior is a Real Power Sprayer

It has sufficient capacity for two lines of hose. It has plenty of power for high pressure defective spraying. It is little in first cost, engine power, pump capacity and ability to do successful spraying. We believe this is the greatest small power sprayer ever manufactured, and placed on the market with phenomenal success in every fruit section in United States and vouched by thousands who own the Famous Hardie Junior. Equipped with one and one-half horsepower engine, battery ignition, 150-gallon tank with mechanical agitator, capacity of four gallons per minute with a steady working pressure of 200 pounds, and two 25-foot of the best spray hose, fitted with spray rods and nozzles; 4-inch tire truck with pole or shaft.

ALL FOR \$330. Delivered Anywhere In This State

If truck is not needed, deduct \$55.00.

These prices are subject to change without notice. The wise buyer will place his order now.

This low price is made possible by big production.

If you are interested in other types and sizes of the HARDIE POWER SPRAYER, write us for the big spray catalog, and learn why we can offer more spray pump value than any other spray pump manufacturer.

The HARDIE ORCHARD GUN is now \$12.00, none better. Every one is guaranteed to give satisfaction to the user, or his money refunded.

The Hardie Spray Hose is the safest hose to buy.

HORTICULTURAL JOTTINGS.

Olives in San Bernardino county are 25 per cent larger crop than last year's, it is reported.

Grape cuttings in Tulare County are now quoted at \$30 to \$35 per thousand, with a restricted output.

There are said to be 400 acres in cantaloupes in Kern county. Returns this year have not been encouraging in this district.

A San Jose man has sold green sugar prunes to the cannery at \$160 a ton. Some of his Sugars weigh eight to the pound.

The Almond Growers' Association at Lodi is planning to enlarge its plant and install new machinery for the more expeditious handling of the nuts.

A car of Thompson Seedless grapes shipped from Fowler July 24 was marketed on the 30th and brought \$4,270, probably the highest price ever obtained for a carload of Thompson Seedless.

The Arlington cannery at Riverside has been burned to the ground and the entire season's output of canned apricots was destroyed. The fire throws about 200 people out of work for the remainder of the season.

Five Japanese growers at Turlock have been arrested and prosecuted for trying to ship unripe cantaloupes in an attempt to evade the new standardization laws. Six hundred crates were turned back and fed to hogs.

Hayward Reed's pear orchard of 325 acres near Marysville (Yuba County) is expected to yield 5,000 tons of pears this season. Harvesting has commenced, giving employment to 250 men. This is probably the most extensive pear orchard in the world.

Apples from the Watsonville district are estimated now at 2,750,000 boxes, or 250,000 boxes more than last year. Growing conditions have been exceedingly favorable and quality and size are reported excellent. The dried apple output of the district will be 4,000 tons.

In San Benito County the price paid for cutting apricots is on the basis of two cents more per box than the fruit runs to the pound. Thus apricots weighing 10 to the pound are cut for 12 cents per 40-pound box, those weighing 15 to the pound, 17 cents, and so on.

Sixty carloads of fruit a day is being shipped out of Sutter county. The train picks up fruit at Oswald, Bogue and other way stations between Marysville and Woodland on the branch line of the Southern Pacific. The fruit is chiefly peaches—nearly \$100,000 worth a day.

Sixty cars of fruit was the average daily shipment of plums, peaches and pears from Placer county last week. Of these Newcastle shipped out 25 cars a day. The fruit-shipping season will close up two weeks earlier than usual. The plums are gone. Prices have been very good.

El Dorado county fruit men will employ only white labor in picking and packing their fruit this year. At a farm bureau meeting in Placerville it was decided to discourage employment of Japanese labor, and to prevent settlements of the Japanese in this country as far as possible.

The first almonds of the new crop were delivered to the warehouse of the California Almond Growers' Exchange, Chico, August 6. These nuts were produced in the Durham section. Orders for the first carload have already been given and will shortly be filled. The Exchange has already sold its estimate of the crop, and prices will be quoted in September.

A big honey crop for the United States is forecasted by the Bureau of Crop Estimates. The yield of surplus honey per colony was 25.8 pounds, and this one-half of the annual product was realized by July 1. In 1918 the surplus was 21.4 pounds per colony and was 13.5 pounds at the same date in 1917. The crop is 92.1 per cent of normal, and good prices are in prospect.

The Apple Growers of Tuolumne county are planning to have a State expert come and conduct a short

course in packing, the growers to grade and pack under his supervision. In this way the growers will learn the proper methods of packing and just what the standardization laws require of them. They hope to have the expert at Sonora about the second week in September.

Reedley (in King's River) is right into work with the peaches. The C. F. C. A. alone is shipping six carloads a day from there (Tuscan Clings). All canneries are working to full capacity and distributing the overflow to other canneries best able to handle it. The E. Y. Foley packing house, the Stewart Fruit Co., the Earl Fruit Co., and the Fresno Fruit Growers are all equally busy—up to their eyes in work.

Where our outside packers have paid a fifteen-cent and upwards flat price for prunes the orchard run has warranted it. The owners might have done a little better on grading their fruit and selling through the association at the published basis prices. It is not believed that the independent packers have a bunch of buyers back east who are willing to pay them more money than the same prunes could be bought for through the association, which controls 75 per cent of the crop.

FOR THE HOME GARAGE

A 15-gallon black steel barrel of Zerolene affords the greatest economy and convenience in the use of correct lubrication. Takes up little room. Consult your dealer or our nearest agency today. Get a Correct Lubrication Chart for your car.

Minutes Count When The Grain Is Ready To Cut

EVERY farmer knows that Harvest time, when the crops of a season's labor must be gathered, demands prompt action. *Minutes count.*

Any tractor-engine trouble means costly delays to him, idle hands and grain lost which might be turned into dollars.

The hot, dependable sparks delivered by the K-W High-Tension Magneto, insure constant no-trouble ignition, guaranteeing service from the tractor 24 hours a day if necessary.

The K-W High-Tension Magneto is of the simple inductor type construction. There are no troublesome commutators and brushes, revolving wires or collector rings, no

moving wires or sliding contacts. All connections on the K-W Magneto are permanent and stationary.

The K-W Magneto is equipped with an Impulse Starter, insuring instant starting of the engine, no loss of time in beginning the day's work—no interrupted service afterwards.

Spring, Summer, Autumn, Winter, the tractor that is K-W equipped can be depended upon under all weather and working conditions to develop the maximum power out of every drop of fuel used, regardless of the kind or how low the grade.

K-W Magnetos were built for tractors and their reputation for reliability has been proved in tractor service.

Write for literature and list of K-W equipped tractors.

The **49^{er}** says—
"the genuine **GIANT**
dates back to
1866"

"I remember well when we used black powder for stump blasting and mining. Just after the Civil War the first Giant Powder ever made in the United States was manufactured in a little laboratory in what is now Golden Gate park.

"Out of that beginning has grown The Giant Powder Co., Con., with its chain of great plants and magazine stocks throughout the entire West. And the Giant Farm Powders are being used for stump blasting, boulder blasting, tree planting, etc., by thousands of Western land owners. Giant Powders have always been so popular that some people have thought any ordinary dynamite was Giant Powder, but that is wrong. The only way to get Giant economy and efficiency is to get the genuine Giant Powders made by the originators of the name."

Just tell us "send me your book," and we will mail you our valuable guide to blasting, "Better Farming with Giant Farm Powders."

MELILOTUS INDICUS Supplies Both

Now is the time to plant it. Buy your seed from
Aggeler & Musser Seed Co.

620 S. Spring St., Los Angeles, California.

Buy only Melilotus seed that has a quality tag on each sack. It protects you against the low germination seed so general on the market this season. This seed is above 99 per cent pure and above 90 per cent germination.

Here and There in the Fruit Business

[Written for Pacific Rural Press.]

The Demand for Shelled Almonds.

"In past years, two-thirds of the almonds sold in this country came from Europe," says R. H. Taylor, Horticulturist with the New State Department. "Seventy-eight per cent of the European almonds marketed in this country are shelled. The imports last year totalled 19,000,000 pounds. It will be necessary for us to cater to the demand for shelled nuts. Only a small percentage of our almond crop is shelled." To protect our industry, Mr. Taylor thinks that the tariff on imported almonds should be 15 cents a pound on shelled and 5 cents a pound on unshelled almonds. The present tariff is four and three cents, respectively. "The freight rates from European ports to America are less than one-half the rates from California to any point East of the Rockies," he says.

Grade Your Fruit.

"Too much stress cannot be laid on the fact that those who expect to sell apples in Great Britain must grade them," says the U. S. Department of Agriculture in Reports in Foreign Markets. "Last year, the British public, having been deprived of foreign apples since the beginning of the war, purchased apples regardless of quality. Large shipments from America, Tasmania, and other places have changed this, and normal market conditions now prevail. The Tasmanian Parliament, appreciating the importance of apple-grading, has issued regulations regarding the export of fruit.

Fruit to Replace Vines.

The Guastl vineyard, a few miles north of Ontario, Los Angeles county, is to be converted into fruit orchards. The vines are being rapidly removed. Part of the vineyard was interplanted with trees last year. The intention is to plant 4,000 acres to peaches, walnuts, etc. Four large wells have been sunk and a reservoir constructed with a capacity of 13,000,000 gallons.

Women Will Continue to Help.

Officials of the Free Employment Bureau at San Jose have organized the first party of women workers to help in the prune harvest. Mrs. A. J. Brady will chaperon the party. It is planned to form a number of these parties and a number of young women and girls have already signed up. Many of the store clerks plan to spend their vacation in this way. They will find it profitable, healthful and enjoyable as well as carrying the consciousness that they are doing patriotic service in helping save food in good condition that all humanity is crying out for.

Grape Juice, at Least.

Representatives of manufacturers of loganberry and grape juices in Washington, Oregon and Pennsylvania have presented before the Senate Finance Committee strong arguments for the repeal of the existing tax of ten per cent on the gross sales of their products.

Water Rate Raised.

The rates for water charged by the Watsonville Water and Light Company have been raised by authorization from the Railroad Commission, which says, noting that the system is but 10 per cent metered: "The benefit to be derived from a metered system is not only an equitable distribution of the charges, but is also a means whereby the water supply can be conserved, good service rendered and operating expenses reduced." The new rates call for a monthly meter minimum of \$1, this rate increasing with the size of the meter. Six hundred cubic feet or less will cost \$1 and all above that amount 15 cents per 100 cubic feet. For each company owned 2-inch hydrant the charge will be \$1 a month; 4-inch, \$1.85. A charge for water sold for irrigating strawberries has been increased from \$30 per acre per annum to \$35.

A Community Packing Association.

The small body of fruit growers who

determined to unite their forces last year at Mount Vernon (Placer county) made a success of it, packing at the farm of one of the members. But to make it more convenient for labor they moved into Auburn this year, renting one of the old stores for a packing house. There are 15 members so far. J. A. Teagarden, the manager of this Mount Vernon Packing Association, said: "We have no trouble in the packing house for a Women's Club at Auburn undertakes the work, thereby discharging a duty to the community, enjoying social intercourse with their fellow-members and making some money besides. They wouldn't go out to work as they have their homes to care for. It is more like an old-fashioned harvesting 'bee' than anything else and is conducive to a harmonious neighborly spirit. We pay these ladies six cents a box for packing plums and pears and 2½ cents for peaches. For cherries we paid 15 cents for ten-pound boxes; above twelve we shipped in bulk. Diamonds, Dukes and Giants are finished. We all have plenty of pickers and can attend to it ourselves."

Workers' Community Camps in South.

The first vineyard workers' community camp to accommodate at least 75 men has been built at Fowler (Fresno county), along the Highway. The city installs the water, light, and sewage system, while the citizens and the Farm Bureau helped to complete the necessary conveniences. The Valley Fruit Growers' Association erected and will control the camp. Similar camps will be built in different sections to accommodate the large amount of help necessary to secure the valuable harvest of the vineyards. Screened kitchens and dining-rooms will be provided together with competent help. The help furnished by these camps will be distributed and returned by motor vehicles. Active co-operation by all is necessary to make a success of the labor-housing movement.

AN EARLY DELIVERY OF PRUNES.

(Written for Pacific Rural Press.)

The first prunes of the 1919 crop will be delivered to the Association Packing Houses this week (second week in August), according to H. G. Coykendall, General Manager of the California Prune and Apricot Growers' Inc. This means that shipment of this year's pack will be made before the end of August, and, with good drying weather, heavy shipments of prunes will be sent out during September.

Grower members will be paid 15 cents a pound for their largest fruit running 20 to the pound as a first payment "on delivery." For sizes ranging from 30 to 100 they will be paid on an 8-cent basis on delivery and for the small sizes, 5 cents. Full payment is made after the fruit has been distributed in the world's market.

The Association estimates that it will handle 90,000 tons of fruit for its members this year, which will net them about \$25,000,000. Half of this sum will be in their pockets within the next three months, as they are paid approximately 50 per cent on delivery of their fruit.

Dried Apricots on the Market.

The Canadian market will receive the first shipment of dried apricots to be sent out of the Santa Clara Valley this year by the association. A carload of mixed grades now being made up will be shipped to Canada before the end of this week, according to a statement made today at the Prune and Apricot Growers' Association headquarters.

Other apricot districts of the State have already shipped several cars of dried apricots to New York and Chicago and other eastern markets and additional cars are expected to be sent out much more rapidly from now on.

The \$7,000,000 3½ Inch Tire

—or it might be called the \$73,000,000 tire, for it is possible only because of the entire resources of the Firestone Company.

BUT \$7,000,000 is what has gone directly into this new, vast Firestone factory that is devoted exclusively to the making of this tire and the tubes to match. The main plant is now concentrating on Cords and big sizes.

16,000 TIRES and 20,000 tubes, all 3½-inch size, is the daily capacity of this new factory. This plant is years in advance in its mechanical efficiency. Into it has gone the thinking, planning, the spirit of service that distinguishes the entire Firestone organization. Its methods and machinery were developed by Firestone men.

FIRESTONE HAS STEPPED FAR AHEAD in engineering practice and you get the benefit. The labor saving equipment of this factory cuts costs on every operation from 10% to 30%.

FROM THE TIME special shipments of rubber and of fabric arrive at this plant, until the finished tire is loaded on the freight car, there is not a backward move.

AND THE MAN POWER of this plant is as far in advance of the ordinary as is the mechanical efficiency. The Firestone organization is the talk of men in big industry everywhere.

THE FACT THAT 90% of Firestone workers own stock in the Company is an index to their interest in their work. Their superior skill, their spirit of service, is stimulated by their financial interest in winning you as a customer.

AT EVERY TURN Firestone thinks and plans to give you the most for your money, knowing that this is the surest method of obtaining the greatest demand. Every move Firestone makes is toward this end—mileage at lowest cost.

NEVER HAS FIRESTONE, NOR ANY TIRE MAKER, offered car owners so much as they are offered now. It is the year of big value. Ask your dealer.

Green Sudan Grass Increased Butterfat

(Written for the Pacific Rural Press.)

When Fred Foiada walked into a Modesto seed store a year ago last spring and ordered 2,500 pounds of sudan grass seed, he knew what he was taking about, but the seedsman almost lost his breath.

Mr. Foiada is a dairyman. He had about 50 acres of sudan grass in 1917. His 95 cows had been fed alfalfa hay and pasture. They were in good condition and averaging about a pound of butterfat per day along in the fall. He cut off the alfalfa entirely and fed the cows nothing but green sudan grass—all they wanted of it. The herd increased its butterfat production an average of 20 pounds per day for the whole month that the green sudan lasted. That is why he says this grass is rich in butterfat. That is why he ordered 2,500 pounds of seed in the spring of 1918. That he was not disappointed last season is indicated by the fact that he bought 2,500 pounds again last spring and had to skirmish around the country to get a few hundred pounds additional this summer.

Planting After Irrigation Ended.

Sudan seed was still being planted when the writer visited Mr. Foiada, July 21. He had one field forty days from seeding in which the grass was over four feet tall on some areas. He had some all ready to cut, some only a foot tall. He had seeded about 100 acres within the past two weeks and still had 45 acres to plant, although all irrigation had been shut off July 15.

Sudan for Hay.

"I cut some of the first year's crop for hay," said he. "It made all of five tons per acre. But I made the mistake of letting it head out, and it became too coarse for good dairy hay. It ought to be cut as soon as it is half-headed out. Then it is finer, but it has the maximum strength and sweetness that we can get in this grass without letting it get too coarse. We don't want to cut or feed it too green, either, because then we don't get the sweetness."

If you want to cut sudan for hay, you ought to plant as early in the spring as is safe for corn. Then irrigate about 30 days later and it springs out three or four inches a day. Mow it when it is half headed and it stools thickly. It can be mowed for hay about once again. But dry weather is needed. New growth comes so fast on irrigated heavy land that it is a foot tall before you can get the hay off. Fall weather doesn't dry it quickly enough. The standing grass stems have drops of water on the outside in September and October, and that makes it hard to cure.

Even in July you would get dripping wet by walking through the field.

Prefers to Feed Sudan Green.

Nothing beats sudan for quantity of hay, but Mr. Foiada prefers alfalfa for this purpose. He feeds most of the crop green. He would have put up a 300-ton silo this year if irrigation had lasted, but without irrigation the yield is reduced.

For green feed, late planting is possible. Although the same amount of seed is used and the same amount of work required, as if it were planted earlier, the late planting makes a second crop following grain. Oats had recently been harvested from the piece being planted when the writer was there. One unirrigated piece cut last September would have made four tons of hay per acre if it hadn't been fed green.

Pointers on Planting.

Owing to the stooling tendency of sudan, it is not advisable to plant over twelve or fifteen pounds of seed per acre. But it must not be planted too thin or the stools may become too large to cut well. One bunch made a full armload—about all a man could handle green. A few like that would try the mowers' tempers.

The finer the seedbed, the better sudan grows, but it also does pretty well if neglected. However, plenty of moisture is needed for plenty of growth, so fine seedbed preparation is profitable, especially in summer planting in order to save moisture. When irrigation is conveniently at command, the best way is to plow, then irrigate and work down the soil before planting. This was done on 125 acres this season by Mr. Foiada. But if you can't get water when you would want it, some must be used before plowing. In either case prompt cultivation is necessary to save the moisture.

It is also necessary to create a fine mulch, which prevents deep penetration of sun-heat. The field Mr. Foiada was planting when we saw him was rather sandy, but less than two inches down we found moist earth. The oat stubble had been promptly plowed with a tractor and harrowed twice. It was being planked just ahead of the sudan drill. This kept the moisture near enough the surface so the seed didn't have to be drilled too deep to come up. It could in one night break through an inch of daily heated surface mulch.

Experience on a seven-acre piece this year, which was not finely harrowed, showed that heat and drying out had killed many well-developed seedlings before they could break through the surface.

There is great room for expansion of sudan grass under similar conditions to those in the Modesto district, and other alfalfa growers may find sudan a good supplementary feed for their cows.

LIMA BEAN LESSON FOR ALMOND MEN.

(Written for Pacific Rural Press.)

"The California Almond Growers' Exchange" tells a good bean story with a punch to it.

On March 1, the lima bean growers of this state had approximately 850,000 bags of lima beans on hand which could not be sold, even though some growers were offering beans as low as five cents a pound.

Citrus fruit had sold right along for the past few months at prices equal to those prevailing during the war with a strong market. Raisins were even higher than when the armistice was signed, with a demand exceeding the supply. New crop prunes were being sold at an exceedingly high price. The almond crop for 1918 was entirely sold and the demand for 1919 exceedingly good.

The bean market situation was demoralized. The growers decided that something must be done. After conferences, they concluded that the only salvation was to pool the crop. The services of C. C. Teague, President of

the Walnut Growers' Association and also a prominent factor in the California Fruit Growers' Exchange, were sought. As a result, Mr. Teague brought together an organization representing over 85 per cent of the lima and baby lima beans on the Pacific Coast, which is known as the Lima Bean Selling Agency.

Merely the announcement that the organization had been effected brought a firmer tone to the lima bean market! The Agency first announced a price of 6½ cents per pound (which by the way was guaranteed against its own decline until August 1), and which brought an avalanche of orders. After three days the Agency was compelled to withdraw from the market, having sold 222 carloads, which would take at least thirty days to ship. Shortly afterward the Agency sold 100 carloads additional at 7½ cents and then advanced the price to 7½ cents. Further advances have been made.

"Let us hope that those growers will never forget the value of organization. Sometimes we have thought

that it would be a mighty good lesson to discontinue the activities of our Almond Exchange for a year. . . . The growers would be told that the crop of almonds in Europe is heavy, that there are on hand over there crops of one and two years in the warehouses, and that the market is demoralized."

"They cannot pass that kind of information while the Exchange exists, because they know that the Exchange is in a position to get all that the market will legitimately pay."

This year's California rice crop was recently estimated by Secretary Charles Merry, of the Pacific Rice Growers' Association, at over 4,250,000 bags. Last year it was about 3,700,000 bags. It was feared earlier that Oriental rice would injure the market for ours this year, but the Asiatic crop is reported short and even higher prices are expected for California rice this year than last. W. C. Davis of the Association estimates this year's average yield at 30 sacks per acre.

The LAUSON Leads

at Walla Walla, Washington

There are 24 sets of Hyatt and Timken roller and ball bearings which make the LAUSON the FULL JEWEL TRACTOR

In the most remarkable, sensational showing ever made by wheel type tractors, the LAUSON carried off first honors over other wheel type tractors at Walla Walla. The LAUSON negotiated the 35% grade and the 43% side hill with ease.

The LAUSON pulled three 14-inch mold-board plows to an average depth of 7 inches without a stop or delay for repair of any kind and operated throughout the demonstration on kerosene. This proves again that the LAUSON has surplus power, greater stamina, more efficiency at the drawbar, better distribution of weight, greater ease of handling. If you are thinking about buying a tractor, find out why the LAUSON is known as "The Pattern Tractor of the Industry."

MOLINE Power Lift GANG NO. 11

97

YOU get real satisfaction from your tractor and a real job of plowing when you use this Moline Plow. It has improved positive power lift device which saves power, time, and enables better work to be done. To raise the plow pull the cord until the power lift lever locks, and the plows are raised without further attention. If you want to raise your plows, just an inch or two or any intermediate distance, to relieve your tractor or clear an obstruction, you can do so by a slight pull on the cord. This is the only lift on which you can change the plowing depth without raising the plow out of the ground. Just one of many features which will make your plowing easier and better. See your Moline Dealer or write for full information.

Moline Plow Co., Moline, Ill.

AGRICULTURAL NOTES.

Butte county rice is looking fine. Cotton looks good in the Imperial Valley.

In the San Joaquin Valley there are 6391 acres of short staple cotton and 285 acres of long staple this year.

Many barley growers are now wishing that they had stuck to barley this year instead of switching to wheat.

Three hundred tons of tomatoes are expected from 16½ acres of the Torres ranch in Contra Costa county.

Turlock district has shipped over 3,000 carloads of cantaloupes this season so far and watermelons over 1,000 cars.

Prices of Siamese rice on the wharf in Siam rose about eleven per cent between January and March of this year.

Exports of rice from Hongkong and Siam are absolutely embargoed—the first time such a thing has occurred in Hongkong.

Five and three-quarters cents for rice is making growers uneasy. It is a record price and for the biggest crop ever in sight.

Yellow dent corn of the 90-day variety stands twelve feet tall eight weeks from planting on the W. M. Harris Los Molinos ranch.

L. D. Macy has been harvesting 150 acres of broom corn on the Vina Stanford ranch at Chico. He showed a sample with brush on it three feet long.

One sack of potatoes is reported to have multiplied to one ton and 50 pounds on ½ of an inch planted by W. C. McCargar of San Joaquin county.

The Hughson (Stanislaus county) sorghum factory is ready to crush the first cane which is expected about the 20th of August. It is said to be a very complete plant.

Special arrangements have been made for the admission of Mexican laborers in the cotton-raising sections of this country, through the U. S. Employment Service.

To buy up your neighbors alfalfa hay and hire a machine to come and grind it on your own ranch is a project suggested by W. C. Brown's activities in San Joaquin county this season.

Cotton is selling at the highest price since the civil war, according to Myron A. Rice, Farm Advisor of Kern county. He says that local growers are being urged to sell now.

On account of the embargo on grain at the various shipping ports, the Ball Bros. storehouse at Clovis is filled to the limit, and they have been turning away grain for lack of space.

The United States Land Farm Company has purchased the Bliss Ranch of 26,000 acres in Madera county for \$1,430,000, it is announced. It is to be subdivided and placed on the market.

G. B. Harlan of Willows put in 350 acres of rice on Clear Creek (Shasta county) and estimates his crop will yield 50 sacks to the acre. This is the first large acreage grown in the county.

The California Bean Growers' Association will send a committee to Washington to seek protection against being again swamped with Oriental beans, which would starve their industry.

G. B. Daniels, former publisher of the Oakland Enquirer, has been appointed by Governor Stephens as a director of the State Board of Agriculture, to succeed Theodore Gier, whose term has expired.

The standard weight of a sack of onions is 100 pounds. The State Sealer of Weights and Measures says that sacks must contain this amount, or have each sack clearly marked with the weight of its contents.

The Canadian wheat crop of 1919 will be bought by the Dominion Government and sold at "prevailing world prices," the surplus proceeds being divided among the original sellers of the wheat. Speculation and profiteering is prohibited.

Prices for threshing rice have advanced over 50 per cent, and as a re-

sult many prominent farmers are considering putting in their own threshing outfits. More new machinery is going into use in the rice industry this season than in any previous one.

Michigan, Colorado and New Mexico will not produce 60 per cent of a crop of beans, according to G. A. Turner, President of the California Bean Growers' Association. "The demand this year for beans is in excess of the supply. A fair price is positively assured for the new crop."

Kern county's alfalfa crop is estimated at 90 per cent, Tulare at 85 and Merced at 80 per cent. Merced county has 105,000 acres to alfalfa, Tulare has 103,000 acres and Kern county has an acreage of 95,000. The crops are reported not to be doing so well this month.

Orange county is planning a tax on trucks and commercial haulers. The heavy traffic now in use is breaking up the highways and paying nothing for their repairs and upkeep beyond

what automobiles pay. They were not built for such heavy traffic as has since developed, it is said.

Oriental rice before the war was largely distributed from Hamburg to European and even American markets. During the war Seattle and San Francisco secured a great deal of this trade, which is now shifting to New Orleans, because of the latter's geographical advantage with respect to both American continents and with Asia via the Panama Canal.

FORD OWNERS! TRY FOR-DO 10 DAYS FREE

**EASIER
TO PUT ON
THAN NEW
PLUGS**

Indianapolis, Ind., March 26, 1919.
G. E. COLBY CO., Maywood, Ill.
Dear Sirs: I bought one of your "For-dos" several weeks ago and it's the best buy I ever made for my Ford. I now use my old discarded spark plugs and save gas. Please write me your offer and price to agents. I can sell some of them. Very truly yours,
A. L. HECKMAN,
608 No. LaSalle St., Indianapolis, Ind.

To prove it, make this test: Pick out any 4 old cracked or worn-out plugs you have thrown away and try them again with "For-do"; see how it will make them spark like new. Oil, carbon or grease have no effect on plugs when "For-do" is used. "For-do" is easily attached to any Ford in 3 minutes. No changes necessary in car or engine, no holes to bore—no bother at all. A child can put it on. Can't possibly harm engine, coil, or plugs.

Send No Money — Just This Coupon

Just write your name and address on the coupon—tear off and mail today. We will send you "For-do" complete, postpaid, ready to attach. Use it 10 days free. At the end of this trial, if you find it does everything we claim, and you want to keep it, send only \$3.00. If you are not pleased, just say so—mail it back, and no charge will be made. We take all the risk. Send the coupon today.

G. E. COLBY CO., Inc., 36 NO. 8TH AVE. MAYWOOD, ILL.

**Send
No Money**

We want every Ford owner to try this wonderful new invention 10 days free, at our risk. Just fill out the coupon below, mail it today and we will send you "For-do" complete, postpaid, ready to use without a cent of pay in advance. When you receive it, put it on your car and watch results. See how much easier it makes your engine start, how much smoother your car will run; how much better it will pull, and how much more mileage you will get from the same gasoline. More than 50,000 "For-dos" have been put on Ford cars the last 3 months. Get one to try 10 days free on your Ford. Send the coupon today.

"FOR-DO"

- Works wonders on Ford cars—
- Gives your Ford more power, more pep, more speed—
- Gives you 4 to 6 miles more per gallon—
- Enables you to locate engine trouble instantly—
- Doubles the life and service of your plugs—
- Saves you many times its cost on repair bills alone.

After 10 days' trial you wouldn't be without "For-do" on your car at any price. But we don't ask you to take our word for this. We prove before you pay, that "For-do" will do just what we claim or you don't keep it. We take all the risk.

Saves Half On Spark Plugs Makes Old Plugs Work Like New

10 DAYS FREE TRIAL COUPON

G. E. COLBY CO., Inc.,
36 No. 8th Ave., Maywood, Ill.
Please send me "For-do" on Free Trial in accordance with your offer. If I decide to keep it, I will send you \$3 within 10 days. If not pleased, I will return it to you promptly and no charge is to be made for this trial.

Potato Crop Short in 1919

Written for Pacific Rural Press by R. E. Hodges.

POTATO CROP PROSPECTS, which on July 1 were for a considerable reduction below the 1918 crop, are still further reduced, as reported August 1 by E. E. Kaufman of the U. S. Bureau of Crop Estimates. The total U. S. crop prospects are reduced from 391,000,000 bushels, as forecasted July 1, to 357,000,000 bushels as forecasted August 1. The California July 1 estimate was 12,252,240 bushels from 88,000 acres, but on August 1 the total crop looked like only 11,668,000 bushels. The condition of the California crop is considered 85 per cent of normal as against 79 per cent a year ago and 88 per cent for a ten-year average.

California is really "small potatoes" in the potato industry of the U. S. Yet this is one of eighteen states, each of which has over 75,000 acres this year. Of the four hundred million bushels of potatoes produced in the U. S. last year, California turned up nearly 13,000,000.

While our potatoes do not compete for the major part, with those of the Middle West, they would if the prices of either district were notably different from the other, for potatoes are easily shipped 2,000 miles or more in good condition. Potato markets of the central west are also responsive to those of the Atlantic states for the same reason. Thus we are interested in markets, crop acreages and conditions in all of the American states.

U. S. Acreage and Crop Reduced.

It is noteworthy and of significance to every potato grower that in practically all of the eighteen major states the acreage is considerably reduced this year; and the total for the U. S. is about five per cent less than last year. The average condition, as estimated July 1 by the U. S. Bureau of Crop Estimates was the same in 1919 as in 1918, so we can look for a smaller crop this year especially since the average conditions in the major states are about the same. Those conditions are, however, somewhat better than the ten-year average. New York leads all the states with 357,000 acres and her crop conditions are eight percentages less than at the same time last year. Michigan is a close second with 333,000 acres, her prospects are four points better than last year. Minnesota, with 309,000 acres, has not so good prospects as last year. The same is true of Pennsylvania with 287,000 acres. Wisconsin, with 289,000 acres, is in about the same condition as last year. No other states have planted as much as 200,000 acres. None of the states west of the Missouri River, except Nebraska, have as much as 100,000 acres this year.

Our Direct Competitors and Ourselves.

Oregon, Washington, and Idaho are our principal direct competitors, but their combined acreage this year is only 45,000, or about 50 per cent greater than that of California. Both their combined acreage and that of California are less than last year. Idaho has an increase of 1,000 acres, but the condition of her crop is very much inferior to that of a year ago, so her total production will probably be less. Oregon, however may have a few more potatoes than last year, though her acreage is reduced by 5,000. Washington's acreage is reduced by 7,000, her crop prospects are better than a year ago, but hardly enough to justify predicting as big a crop. California's acreage was reduced two thousand, and the crop shows less promise than it did a year ago.

Potatoes from all of these four states are marketed chiefly west of the eastern line of the Rockies. Northwestern potatoes are strong competitors with our own on our own markets as well as in Arizona, Utah, Colorado, New Mexico, and Texas. We have advantage in distance, and our potato storages are not sealed up by the icy grip of winter as those in the northwest frequently are, but our yield per acre is so much less that the northwestern growers can often underbid us in our own cities.

Early Potatoes Important.

Part of our potato area produces

two crops per year. Part of it produces only an early crop. Most of it produces only a late crop. Southern California is the leader for earlies, though southern San Joaquin Valley and the Delta in northern San Joaquin Valley as well as certain districts in Sacramento County contribute largely to the early crop from California. These early potatoes practically monopolize the early markets of Texas and the Rocky Mountains and westward while the crop lasts. Also many carloads of them go to Kansas City, Omaha, Chicago, Des Moines, etc., where in midsummer they compete with early northwesterners. They are about gone now for this season, although we note from the August 5 report, which has just come to hand, that 52 carloads were shipped that day from California, of which two went to Arizona and two to Colorado from Southern California, and the other carloads went from "Northern" California to Omaha, Arizona, Kansas City, Oregon, Texas, and New Mexico. At this season, however, we are beginning to encounter competition from early northwestern potatoes, though just now the latter are not reaching southwestern markets nor California. Our local markets had a depression this summer when potatoes from the Delta came in quantity-competition with those from Southern California, but prices have picked up again, and there seems reason to believe that the markets will remain firm throughout the marketing season for the 1919 crop.

Imports and Exports Unimportant.

Potato imports and exports of the U. S. do not materially affect the general markets, though the past year has developed some rather startling changes. The latest figures we have on potato exports and imports are those of May 31. During the eleven months ending that date, the U. S. imported 119,238 bushels in 1917, 131,153 bushels in 1918, and 2,735,444 bushels in 1919. A large part of the imports came to the Atlantic side. The great increase last year is more than offset by our exports of 3,375,958 bushels, besides \$50,513 bushels of the foreign potatoes which were exported after importation. Our exports last year, however, were not materially greater than those of the year before when they did not come so near balancing the imports. But after all, the total quantity of exports or imports is not much as compared with our own production of 400,000,000 bushels.

STARTED ON A 40-YEAR CRUISE.

A satisfied subscriber writes thus: "Your paper is O. K. Your solicitor said when we first subscribed he had just renewed a 40-year-old subscriber's paper for him and if we started in we would be taking it forty years hence! This will make five years of it so far, and we are still going strong."

"It is my opinion that the cotton crops in the valley have improved in condition as compared with the last week in June, as follows," says Robert Hulme of Fresno: 90 per cent improvement in Bakersfield district; 100 per cent in the Corcoran district, and 60 per cent in the Fresno district. The Pima cotton in the Bakersfield district is doing particularly well."

Grain lying in the field in Yuba county is reported to have been stolen. Some growers obtain partial insurance against theft by marking their sacks.

Get Bigger Money Harvests Easier

You farmers can save *all* the grain you raise—with an E-B Osborne Grain Binder.

Cutter bar can be set close to the ground. Reel can be adjusted to push down grain onto platform. Platform canvas runs one-seventh faster than elevator, straightening grain before elevating. Seventh roller avoids grain dropping through onto main wheel and helps prevent clogging. Drop leaves, grain springs and three discharge arms prevent stringing grain. Get all the interesting harvesting facts about the

E-B Osborne Grain Binder

from your dealer at once—or write us.

The uniting of E-B with Osborne means much to you in harvesting your crops. The Emerson-Brantingham Implement Company rep-

resents an organization of 4,000 men and 7 factories, and 67 years' experience in building fine farm machinery. Combined with this is the Osborne reputation for making harvesting machinery of all kinds.

Make Your Land Hump Itself

If you want your land to hump itself with the biggest crop you ever had, pulverize every clod for quickest seed sprouting, and loosening up the plant food for most rapid growth of young plant. And do it with this light draft, roller-bearing

Brillion King Team or Pulverizer

It crushes every clod into powder, loosens every particle of plant food, thoroughly packs the soil for holding the necessary moisture for the most rapid growth and biggest possible crop yield. Prices reasonable. Strongly built, roller-bearing, lasts lifetime.

AT ALL JOHN DEERE DEALERS

GRAIN BAGS HARD TO GET.

(Written for Pacific Rural Press.)

The grain-bag market is not hysterical though there is a tendency for some people to get hysterical about it. Many rice growers still have bags to buy. It is noteworthy that all this season the market for jute and burlap has been on the upward trend. Whenever buyers refused to pay advanced prices, holders sat tight and buyers eventually paid the higher prices.

This situation has come about through Calcutta domination of the market and through the universal difficulty encountered in getting shipping space for jute or burlap or bags. Lifting the embargo on shipments to Germany was anticipated by the Calcutta factors and did not create a great deal of impression on the market when it occurred.

Jute Crop Short.

The crop acreage report, issued about July 12, indicated 2,749,000 acres of jute in India. This was about ten per cent increase over the previous year, and the crop was reported in good condition, but knowledge of the extra acreage did not cause much flurry because it did not prove a greater crop, and anyhow the carry-over from last year's crop was less than usual. A very recent Government report places the production this year at 2,000,000 bales below normal.

Calcutta Dominates Bag Market.

A large proportion of the jute is spun and woven in Calcutta mills. A great deal, however, is shipped as jute to the Scotch center of Dundee, and some raw jute is shipped to New York. All markets fluctuate in response to changes in Calcutta.

Speculators, of course, make headquarters there. These practically useless middlemen also gained control of a great deal of the available shipping tonnage and made a pile by extorting high rates from bonafide shippers. Financial exchange has added to the difficulties and expense of importations from Calcutta. On top of that, the Calcutta mills entered an agreement to operate only four days per week up to September 30, thus restricting the output of burlap. More recently the four-day agreement has been extended to November 30, and it is reported that another month has since been added. This, of course, keeps prices up. One reason for the short running time is claimed to be shortage of labor.

May shipments of burlap from Calcutta to the United States were reported to have been 50,000,000 yards, of which only 9,000,000 came to the west coast. June shipments were reported to include 78,400,000 yards to our east coast ports, 5,300,000 to our west coast ports, and 4,000,000 to Canada. However, it was suspected that part of the reported June shipments included burlap that had been delayed from intended May shipments. Late in June cablegrams from Calcutta indicated practical impossibility of getting shipping space for any considerable quantity until the end of August, as the British and Germans were making large reservations, both of burlap and of shipping space.

Consuming Pressure Strong.

As late as June, English and American spinners and weavers and bag manufacturers refused to buy liberally at the advancing prices, but pressure from consuming buyers increased until bag stocks were about cleaned up. Manufacturers then found it necessary and profitable to buy at the required prices. During July the offerings of jute and burlap were scarce, and bag manufacturers were putting up a healthy demand based on robust call from consumers. Prices for grain bags, August 11, were quoted at 18 cents in wholesale quantities.

Our Advice Proves Helpful.

I am glad to report that my foundered horse is very much better after following your directions. It has taken quite a long time to bring him out of the trouble, but the new hoofs on his front feet have grown out about an inch, and we think he will soon be O. K. I thank you very much for your help.—J. D. Hart, Santa Maria.

CULTI-PACKER

TRADE MARK REG.

It Cultivates — It Packs

Which Seed Will Grow Best?

Put a seed in fine, moist earth and firm the soil particles closely around it.

Put another seed in a soil that is loose or lumpy and where moisture has partly dried out. Let it be loosely surrounded by earth.

Which seed will grow best—which roots will have the best opportunity—which will give the hardiest plant—which will yield the biggest crop?

You know the first seed will stand at least five chances to one—but are you planning to give your seed that same advantage this fall?

SOIL SENSE BOOK

Ask your dealer for this free 60-page book on soils, illustrated with over 100 fine soil photographs.

Half an hour's trial in your field will absolutely convince you that a Cultivator-Packer will make a finer, firmer, better moisture holding seed bed than any tool you ever used.

Go to your local dealer now. Order a Cultivator-Packer. Use it in making your seed bed, then after the seeder and in all the other ways the instructions suggest.

We give you our word, backed by sixty years of honest dealing, that you will be satisfied with the purchase.

The Cultivator-Packer is equally adapted for use with horses or tractor

Suggestive Agricultural Pointers

(Written for Pacific Rural Press.)

Seed Growers Organized.

An organization of leading seed growers of the state filed articles of incorporation August 5. They will have headquarters at San Jose, according to their attorney, Aaron Sapiro.

Plant Cabbage Seed Soon.

June to August is generally the best time to sow cabbage seed to pro-

duce plants for the winter crop. Transplanting will then be done around the holidays. An ounce of seed will plant 400 feet of row as thickly as it is desirable to have the seedlings.

Sweet-Corn Ear Worm.

Garden sweet corn is almost universally affected with worms in California. The moths lay their eggs on corn silks. To get the worm before it gets to the corn, dust the silks with a half and half mixture of powdered lime or flour and powdered arsenate of lead. The latter is poison, but none of it is likely ever to touch the kernels and would be washed off by the housewife if it did.

Wheat Exports Multiplied.

In the twelve months ending June, 1918, we were bending every energy to ship wheat to the allies, yet we exported only 34,118,853 bushels. Our efforts must have accumulated momentum, for in the following twelve months we exported 181,414,673 bushels. The momentum is further indicated by the relation of 466,624 bushels exported in June, 1918, to 19,221,853 bushels exported in June, 1919.

Barley Exports 1,000 Per Cent.

Barley exports from the United States for June, 1918, were 613,901 bushels. In June, 1919, we shipped to foreign countries 6,046,275 bushels, or practically ten times as much. In the year ending June 30, 1919. For our barley exports were 26,285,378 bushels as against 20,457,781 bushels in the year ending June 30, 1919. For several months since the 1918 harvest there was stagnation of barley movement, but shipping has been excessive in recent weeks.

Have Your Scales Tested.

Disagreeable disputes often occur between grain growers and warehousemen as to weight of grain delivered to warehouses. This frequently occurs when the warehouse scales are inspected and sealed by a state or county sealer of weights and measures and the farm scales are not. The State Superintendent of Weights and Measures will have your scales officially tested and sealed at nominal cost. They must be so tested before you weight for the public.

Wanted—Owner of 86 Sacks of Beans!

Some indication of the feeling of bean growers is seen in the inability of a Merced warehouse man to locate the owner of a lot of 86 sacks of beans stored in his warehouse last fall. Some other bean owners were located recently after long search. Taxes have to be paid on these lots and the warehousement did not want to add that charge to the warehouse charges, possibly figuring that the beans would not sell for enough to cover both charges.

Masqueraded as Co-operative Organization.

A decision was handed down last month commanding the Farmers' Co-operative Fertilizer Co. of Kansas City to desist from business. The hearing was held in Washington, D. C., February 17, 1919. It was shown that Armour & Co were masquerading under the guise of a co-operative organization whereby they secured business that probably could not have been secured above board. This was in violation of the Federal Trade Commission Act.

Cheap Help for Indian Corn Harvest.

Too much work to harvest Indian Corn! Let the hogs help, as M. Bas-

sett of Kings County does. Indian corn is not so wasteful to hog down as gyp. Mr. Bassett turns hogs into the field just when the kernels will shell off—later than he would cut it for silage, but just at the stage it would be cut for fodder in the East. Some fields must be gathered by hand for winter feed. Hogs are later turned into these to clean up the waste. They are seldom fed anything else during this time.

Onions Here and in the East.

Australian Brown onions were bringing \$2 to \$2.25 wholesale in Stockton August 5. On the same day Stockton Australian Browns were quoted wholesale in Omaha at \$4, in Chicago at \$3.50 to \$4 and New Orleans at \$5 to \$5.25. Freight from Stockton to Omaha and New Orleans is 94 cents per hundred and to Chicago is \$1.39 per hundred. Freight to Chicago was 45 cents greater than to the other cities, yet our onions there were cheaper than at Omaha and \$1.25 to \$1.50 cheaper than at New Orleans. Possibly the climate had something to do with this, but more likely the variation was more largely due to unscientific distribution, which resulted in an oversupply in Chicago and an undersupply in New Orleans. The difference between Stockton and central western prices, aside from freight, represents the handlers' charges between grower and jobber.

Lettuce Planting in Imperial.

Late August is the time to thoroughly soak the fields to be planted to lettuce in Imperial County. They are plowed as soon as possible after irrigation and worked down fine and well leveled. Then narrow furrows are made about 2½ feet apart from center to center and a light float smooths the ridges between them, about 14 inches wide. The lettuce is planted with a drill early in September on top of the flattened ridges, but near their edges, so frequent irrigations will keep the roots moist without flooding the surface soil. When the plants have four or five leaves so they are pretty sure to grow, they are thinned, leaving them eight or ten inches apart and using excess plants to fill in where a poor stand is found. A first class man can thin half an acre in ten hours. Twelve-inch spacing produces the highest priced heads.

Mellilotus Increased Potatoes.

A winter crop of mellilotus plowed under in the spring may be given a large part of the credit for an increase of 65 sacks of potatoes per acre on five acres grown by L. R. Doan of Los Angeles County. Three acres heavily fertilized with manure made an increase not nearly as noticeable as the mellilotus section. The idea was suggested by Prof. J. Elliot Coit, who was then Los Angeles Farm Adviser. The five acres produced 40 sacks of potatoes per acre in a previous year. In October, 1917, the mellilotus was planted so it would get a good start before cold weather, during which it does not seem to grow much above ground. In spring, it shoots ahead, however, so this piece was about 2½ feet tall in March. It was mashed down with a drag and disked both ways, then plowed deep. Ten days later, about April 1, the potatoes were planted and the mellilotus was found rather well decayed. The manured piece was planted the same time. Where mellilotus had been plowed under, the potatoes yielded 105 sacks per acre.

SWEET POTATO INDUSTRY TO EXPAND IN CALIFORNIA.

THE SWEET POTATO curing plant at Turlock is over a third completed and two units will be ready for sweet potatoes by September 1. This will be the largest sweet potato curing and storage plant in the world. Crops to fill it are now growing under contract. Harry Beck of Longview, Texas, where the oldest plant of this kind has been the means of multiplying the acreage and making poor farmers prosperous, is visiting California. He says there is every favorable condition here for great increase in acreage; but we need better varieties. He hopes, through the operation of the Turlock plant, to introduce several varieties that have proved outstanding at Longview. The best of these, according to Mr. Beck, is the Pumpkin Yam, which must be baked in a pan to save the syrup that comes out in baking. The Porto Rico sweet potato introduced from Porto Rico to Longview has proved one of the most prolific good varieties. With cheap and certain facilities for storing sweet potatoes until the new crop comes in, and with climate and soil favorable, a great increase in this crop may be expected.

Making the Best Engine Better-

Fairbanks-Morse "Z" Farm Engine with Bosch Magneto

JUST think of the famous "Z" engine with a Bosch high tension, oscillating magneto—which delivers a steady succession of hot, intensive sparks. ¶ Every farmer in America should at once call on the nearest "Z" engine dealer and see the result of this recent epoch-making combination—FAIRBANKS-MORSE "Z" WITH BOSCH MAGNETO. ¶ Mechanical perfection, plus power—and right price—to date sold the "Z" to over 250,000 farmers. ¶ This quality and quantity production enabled us to contract for a large proportion of the extensive Bosch facilities for making this one possible "Z" betterment, which establishes a new farm engine standard. ¶ And over 200 Bosch Service Stations assist all our dealers in delivering maximum engine service. Prices—1½ H. P. \$75.00—3 H. P. \$125.00—6 H. P. \$200.00—All F. O. B. Factory.

Fairbanks, Morse & Co.

MANUFACTURERS CHICAGO

Mechanical Power on the Farm

Users of tractors, engines, pumping plants, motor trucks, automobiles, electric motors, and other mechanical farm power are invited to make this department an exchange of their experiences and troubles.

GREAT PUMPS IRRIGATE FROM RIVER.

When Sutter Basin was covered deep with water each winter and farmed only around the edges where river seepage helped keep fields moist, no irrigation was practiced. Now that the water has been excluded by big levees, 60,000 acres are to be worked the year around, specializing on the system of getting two crops a year from the same land. This means that it has to be irrigated. A pumping plant has recently been completed to use river water for the purpose. Three forty-two-inch centrifugal pumps, which will have a capacity around 180,000 gallons per minute, are to be run by motors of 250 horsepower for each pump. The area is all level or with a slight uniform slope. This year it includes 17,000 acres of barley, 9,000 acres of wheat, 13,000 acres of beans, 7,500 acres of rice, and a great deal of corn and other crops.

PUMP SAVES LAKE COUNTY ALFALFA.

Mr. H. W. Merritt of Lake County finds that two second-hand automobile engines, for which he paid \$50.00 a piece, answer his purpose finely for pumping water for his alfalfa. He has no belt, but gets direct action. He has done away with what he calls the foot valve in his pump and considers that it is the greatest improvement and advantage that he has made in his pumping plants. While many farmers claim they do not have to irrigate in this valley, Mr. Merritt finds it does pay. From his third cutting of alfalfa he got one ton per acre. The piece adjoining his on same kind of soil yielded only 1 ton from ten acres and is now dry.

INCREASING DEMAND FOR POWER PUMPS.

The San Joaquin Light and Power Company has a great many working parties constantly in the field now installing leads of power-line to pumping plants. It is said that 30,000 acres of land have been placed under irrigation this year by using water from electrically-driven pumps.

The chief value of the pump method is that it is under the control of the owner throughout the year and he can irrigate at any time he wishes. According to A. G. Wishon, manager of the above company, the 30,000 additional kilowatts available when their new plant is completed will probably result in 2,000 pumps additional being installed.

U. S. Potash Production and Imports

(Written for the Pacific Rural Press.)

Potash production in the U. S. has increased in a very healthy way during the past three years as shown by the International Institute of Agriculture. Total production of soluble potash (the only kind suitable for fertilization) was 8,818,000 kilograms in 1916 (a kilogram equals about 2.2 pounds), or close to 10,000 tons. Production more than trebled in 1917, and increased over 60 per cent in 1918 over the previous years. Three-fourths of all the soluble potash produced in 1918 came from natural salts. Soluble potash from mineral sources constituted 60.1 per cent of the total soluble production in 1916. This percentage increased to 76.3 in 1917 and 83 per cent in 1918. Thus the furor regarding recovery of potash fertilizer from seaweed dwindled in proportion though it actually gained a little in tonnage each year. The same is true of potash from molasses of distilleries. The newspaper hysterics about recovering fertilizer for the nation from the waste of cement works began in 1917 and dwindled in 1918.

CHARGES FOR ARTESIAN WATER.

To the Editor: What charges should be made to a neighbor who has land adjoining my farm. He wishes to irrigate from my artesian well which flows about 65 miner's inches.—T. A. C., Stanislaus.

Your water is probably inexpensive and it might pay you to gain your neighbor's good will by selling to him at cost with perhaps ten per cent profit added to cover your risk and general supervision. The cost will include interest on the cost of the well, charges for keeping it in operation, and a depreciation charge for eventual overhauling of the well if the casing should give way. Prorate the total of these items between yourself and your neighbor in proportion to the amount of water used by each. Then add your profit, if you wish, as suggested.

COUNTY LICENSES FOR MOTOR TRUCKS.

Sacramento County proposes to make motor trucks pay the county something for the use of county roads. A license fee proportional to load capacity is to be paid to the county, if an ordinance now being drafted shall pass and be found legal. We are informed by an employee of the State Motor Vehicle Department that such an ordinance would be illegal. State licenses for motor trucks cost 40 cents per horsepower plus \$5 for trucks weighing under 4,000 to 6,000 pounds unladen, \$10 for those weighing 4,000 to 6,000 pounds, \$15 for those weighing 6,000 to 10,000 pounds, and \$20 for those weighing over 10,000 pounds. Horsepower of all motor vehicles is figured by squaring the diameter of the cylinder in inches, multiplying by the number of cylinders, and dividing by 2.5. Motor trucks using pneumatic tires seem to be exempted from the surcharges mentioned.

FARMERS' CHIEF TRACTOR QUESTIONS.

"The largest number of inquiries on any one subject coming to the Division of Engineering of the College of Agriculture pertain to tractors and refer to selection in particular," writes Prof. J. B. Davidson in the Sun Maid Herald.

"Tree or four years ago the majority of inquiries were concerning the relative economy of horse and tractor power, but now this question is not so prominent and the outstanding question is—what kind of a tractor to buy?"

Imports of potash to the U. S. practically doubled in the fiscal year 1918 over 1917 and increased 50 per cent in the fiscal year 1919. Imports in the eleven months ending May 31, 1919, totaled about 19,000 long tons (2240 pounds each), of which muriate of potash comprised about 1400 tons, carbonate of potash 700 tons, and nitrate of potash or saltpeter about 17,000 tons. In May, 1919, the imports of saltpeter amounted to about 600 tons, which was about 200 tons less than was imported during the war month of May, 1918. The nitrate of potash is soluble and good fertilizer, but has been used mostly for explosives.

Exports of potash from our seaweed amounted to about 900 tons in the eleven months ending May 31, 1919, which was some growth over the previous year and constituted about one-fourth of all that was manufactured in the same time. This is practically all that was exported, the imports and other domestic production having been used in this country.

Let It Carry Your Load

IN the olden days folks put the world on the back of a fabled giant called "Atlas." Today progressive farmers put a world of work on the shoulders of an

International Kerosene Engine

This sturdy, reliable, willing, inexpensive servant is doing more today to take drudgery out of farming than any other one factor. It tackles scores of jobs about the farm—such as sawing wood, pumping water, cutting feed, running the fanning mill, etc., and disposes of them swiftly and satisfactorily.

Rations for the smallest size cost less than 3c per hour—pretty cheap board for a "jack-of-all-trades" that does the work of a dozen men. Stop working so hard. Slip all the pesky little jobs to an International. It conserves your time and labor and fattens your purse. There are three sizes, 1½, 3 and 6-H. P., all operating on kerosene or gasoline.

An International dealer nearby will go over this work wizard, point by point, and explain why its "credentials" are gilt edge. Or write the address below and full information will be supplied.

My WADE Saws Four Cords an Hour!

"The Wade is certainly the farmer's friend. I have cut 1600 cords of yellow fir wood with it, and it's as good as the day I bought it."—Dan Ross, Corbett, Oregon.

Why break your back sawing wood by hand, when the powerful little Wade Portable Gasoline Drag Saw will outlast 10 men at one-tenth the cost! Light, simple, economical. Cuts wood of any size. Averages 8 cords to a gallon of gasoline. Thousands of Wades now in use. When not sawing wood, the 4 h. p. engine will operate other light machinery.

Prompt delivery on Wades from over 100 points U. S. and Canada.

Wade Portable Gasoline Drag Saw

The New 16 valve Twin City Tractor PAYS BIG DIVIDENDS

For the first time in the history of the tractor industry, the 4-cylinder, 16-valve engine (valve in head type) is now applied to a tractor. The TWIN CITY 12-20 with its 16-valve motor actually develops 25 per cent more than its rated horsepower.

This new 12-20 is a light weight tractor that will out-pull, out-last, and out-dividend other tractors of equal rating.

Not built down to a price, but built up to a fixed ideal—to do the work assigned to it better than it has ever been done before.

The highest grade tractor will unfailingly prove the least expensive and pay the biggest dividends.

WHEAT OR BARLEY NEXT YEAR.

(Written for Pacific Rural Press.)

Recent high barley prices unsettled some of the good work done in the "More and Better Wheat" campaign which was so successful last fall. More recent declines in barley have left folks somewhat in the air and made more promising the success of another similar campaign this fall by the Sperry Flour Co. The recent decline from \$3.40 to \$2.90 on December barley will help greatly. We have never been able to see how the high price levels could long be maintained in the face of reduced consumption the world over.

As stated by the Sperry Co. California raised 53,000,000 bushels of wheat in 1896, 7,000,000 bushels in 1918, and more than double the 1918 crop in the past season. Six thousand tons of Early Baart wheat were planted in this State last fall, and it proved almost universally satisfactory. Over 100 tons of Bunyip (Sperry No. 1) were planted and results were equally satisfactory. These varieties have proved valuable competitors against barley in earliness and yield, while the price has been better than even the barley inflation.

Wheat bulletins will be issued weekly by the Sperry Co. from their Stockton office to all who ask for them. The August 15 bulletin is a review of the world's markets showing the probable future values of coarse grains with special reference to wheat and barley. The August 22 bulletin will deal with the suitability of various California soils for wheat. August 29 the subject will be Early Baart and Bunyip wheat and their requirements. The September 5 bulletin will cover preparation of soil, weed killing and prevention, value of fallow and early planting. On September 12 treatment for smut and selection of true-type seed will be discussed.

BEAN DELEGATION TO WASHINGTON.

At a meeting of the California Bean Growers' Association, August 1, it was decided to send a delegation to a meeting which has been arranged with the Ways and Means Committee of Congress in September. The object is to secure a tariff of four cents per pound on imports of Oriental beans, since any lower tariff would not keep them out of competition with our own. The delegation will consist of President G. A. Turner of the California Bean Growers' Association; Aaron Sapiro, attorney for the association; C. K. Hardenbrook of Lompoc; C. L. Preisker of Santa Maria, and Jesse Mendenhall.

All principal bean sections in the United States will co-operate in this effort, either through representatives of their organizations or through temporary committees where no organizations exist.

Perhaps an Embargo.

If it is possible to get a transcript of the evidence in the hearing where the import company fraud was disclosed as published in our issue of July 26, they will go to President Wilson, show him that the bean growers have lost money due to fraud in the Food Administration, and ask that he proclaim an embargo, keeping all Oriental beans out of the United States until our present crop is well marketed. Of course, that would tend to raise the price of beans in a time of high cost of living and with a smaller crop than last year, but bean growers are entitled to extra profit this year to make up some of the losses of last season. Moreover, consumers and Government may well consent to measures which will make bean-growing profitable in America, or we will soon be depending for this staple food on a people who will raise prices with impunity whenever they know our own crops are short, and we will have no control over them.

Over 50,000,000 bushels of wheat were in the elevators, mills, warehouses, and in wholesale hands July 1, not including stock on farms and in commercial hands, according to the Federal Bureau of Markets. This is more than three times the "carry-over" of a year ago.

We Manufacture Levelers for Any Power From 6 Horses to a 75 H. P. Tractor

A Schmeiser Leveler

WILL WORK WONDERS ON YOUR FARM

Moving immense amounts of dirt daily, and working on ground too tough for horses and Frescos to tackle, SCHMEISER POWER LAND LEVELERS are now being used with utmost success by a great many ranchers, large and small—also by contractors—saving their owners' time, labor and money.

So extremely simple, a child could operate one, as a simple twist of the wrist raises and lowers the bucket or holds it stationary, as the case may require.

A GREAT ROAD MACHINE

Every road district should own one of these machines for constructing roads. They will cut down the high places and make fills quicker and cheaper than by any other known method.

YOU SHOULD

Are You Salting Your Cows?

(Written for the Pacific Rural Press.)

An important item that is often overlooked in the management of the dairy herd, and other animals as well, is the necessity of providing salt in the ration. All farm animals have an instinctive craving for salt, and become emaciated when deprived of it. It is more than an appetizer; it is a real necessity. It promotes an active circulation of the blood, which never becomes thick and sluggish so long as the supply is plentiful; it assists digestion, and often proves a preventive of disease.

"But how much salt should a mature cow receive per day?" That is a question which is often asked, and experiments conducted by Prof. Babcock, the inventor of the milk tester, may prove helpful. He found that if salt was withheld entirely the effect would be seen in some cows in two or three weeks, but others went for the greater part of a year without any bad effects. Sooner or later, however, every animal developed a state of low vitality, ending in a complete breakdown, although recovery was rapid when salt was again given. The breakdown was marked by a loss of appetite, a generally haggard appearance, lusterless eyes, a rough coat, and a very rapid decline in both live weight and yield of milk.

The effect was worse at calving time or immediately after. In general, cows giving the largest amount of milk were the first to show signs of distress. There was less trouble with those on pasture than with those kept in the barn and fed. Dry cows suffered very little, and the same applied to stock cattle—the salt naturally in the food or in the "earth-licks" of animals in the fields being nearly sufficient for them.

In an ordinarily daily ration there is about three-quarters of an ounce of salt, and this is nearly, but not quite, sufficient for dry stock, but not enough for a milk cow as the milk drains away a lot of salt from the system. According to Henry and Morrison's "Feeds and Feeding," a cow requires about three-quarters of an ounce of salt daily per 1,000 lbs. live weight for maintenance, and 0.6 ounce extra for each 20 lbs. of milk produced. On this basis the average cow, yielding from 20 to 30 pounds of milk per day, requires about 1½ ounces of salt, and she will get from ½ to ¾ ounce of this in her feed. More salt is required by cows at high elevations and at points far removed from the ocean, and for this reason very little salt is needed in the Imperial Valley aside from that provided in the feed.

On the other hand, excessive salt—5 to 7 ounces per day—causes excessive excretion of urine from the kidneys. If water is not supplied to replace this, kidney trouble results. If it is supplied freely the excessive water used does not increase the milk yield, but causes digestive disturbances and scours, which reduce milk yield and health.

Some farmers make a practice of salting their cows only once a week or so, generally putting it in a trough and giving them free access to it. This method should be discouraged, for after cows have been deprived of salt for several days they are apt to overeat of it, and then there is trouble.

Salt may be provided in the daily ration by mixing it with the grain, but this method is not entirely satisfactory, because, as a rule, the cows are fed collectively, rather than individually, and the one giving 50 pounds of milk will receive no more than the one giving 20 pounds. Also there is the danger of unevenness in mixing.

Consequently, except to make a ration more tasty, or to furnish a little variety, the simple method of giving cows free access to salt daily is the best, as each one can then satisfy her individual appetite. Keep it in a box or trough in the corral, under cover, if possible, and each cow will consume just as much as she needs and no more.

Either rock salt or dairy salt will answer. It is so cheap that no dairyman can afford to deny his cows all they want to eat, and it should be

borne in mind at all times that salt is absolutely essential to the economic handling and health of dairy cattle, as well as all other classes of livestock.

DAIRYMEN, USE YOUR OWN GOODS.

"Have you any good butter," inquired a customer of his grocer in a small town.

"Yes," replied the grocer, "here's six pounds. A farmer just brought it in to me, and bought oleomargarine to take home with him."

If this were the only penny-wise, pound-foolish farmer in the country the incident would not be worth mentioning, but there is a growing tendency on the part of dairymen to cut their own throats, and at the same time starve their families, in order to save a few pennies a day. In the dairy sections of the state where farmers are selling their butterfat to creameries we find that, instead of encouraging the industry by buying butter back from the creameries, quite a number are purchasing oleomargarine at grocery stores and are using very little butter, thus helping to create a surplus of butter, depress the

market price of their product and give the industry a setback.

"Go home and eat butter," was the injunction thrust upon the members of the Chicago Milk Producers' Association by Chairman Potter. He told them that the city people were simply following their lead in buying milk and butter substitutes, and that just as long as they used oleomargarine for their own tables they had no right to complain because they were not making enough money.

We say "Amen!" to this condemnation of those who use substitutes for their own products. Perhaps the campaign for eliminating the ignorance that exists regarding the food value of dairy products should be extended to the dairymen themselves. We hope that this class of short-sighted dairymen will soon disappear, and that every one will support the industry upon the success of which his own success depends.

BRIDGFORD'S NEW RANCH UNDER WAY.

The Bridgford Company, now of Knightsen, whose fame as Holstein breeders is nation-wide, have commenced to erect extensive dairy buildings on their new ranch at Patterson. Contracts have already been let for the milking barn, milk house, feed room, calf barn, test barn, feeding

sheds, corrals, office building, and quarters for the men. Also plans are being completed for a residence for H. V. Bridgford, the manager.

The buildings will be attractive and substantial and will include the very latest sanitary and labor-saving devices. A complete drainage system, designed to keep the buildings, paddocks and corrals, dry and clean at all times of the year, will be installed. The whole plant will be electrically lighted. Contracts now let call for completion of the buildings by October 6.

The entire herd of Holsteins will be moved to Patterson as soon as the new quarters are ready, and the business will then be conducted under the name of the Bridgford Holstein Company.

Not every dairy farmer can afford to own a good registered bull, but the bull association has made it possible for each member to own a share in one. A farmer for \$50 may buy a scrub bull, but if five farmers will join a bull association and each invest \$50 they may own a \$250 purebred bull.

Butterfat in milk has been found by investigation to average as follows: Holstein, 3.42 per cent; Ayrshire, 3.66 per cent; Brown Swiss, 4.24 per cent; Shorthorn, 4.05 per cent; Guernsey, 5.16 per cent; Jersey, 5.35 per cent.

START WITH GUERNSEYS

This is the breed to take up if you want to make the greatest possible profit from dairying. The Guernsey is noted for the most economical production of milk and butterfat, as well as the best flavored and highest natural colored products. In all impartial trials the Guernsey has shown greater returns for each dollar invested in feed than any other breed.

BEGIN WITH THE BEST

We believe that our herd cannot be surpassed anywhere in uniformity of type, health, breeding and production. Heretofore most of our cows have been held above price, but now, because of the rapid increase of our business along other lines, we are compelled to disperse this entire Guernsey herd.

100 HEAD AT PRIVATE SALE

Everything goes; not an animal reserved. There are 83 females of great production and promise; 17 males that are real herd headers. Twenty-one of the cows have Advanced Registry official yearly records of from 500 to 800 pounds butterfat, and several more are now on test.

If you want show quality as well as heavy production, you will find them here. The herd includes the grand champion cow and the junior champion bull at the last San Francisco Show, and many young animals fit to win in the hottest competition. Will sell separately or in lots.

FEMALES OF GREAT PROMISE

While a good share of the mature females have been given records, they have not been forced, and there is not a cow in the herd that has shown her limit of production. Also many of the untested cows give promise of making even better records than the ones already tested.

BULLS FOR BREEDING UP

Guernsey bulls quickly build up grade herds. They are so prepotent that they stamp the breed characteristics upon their offspring to a marked degree, and soon you have profitable producers of quality products. We offer some royally bred young bulls that will quickly double the profits from your herd.

Your Opportunity—Act Quickly

The sales list is completed and we are ready to sell. Breeders know how difficult it has been to secure good Guernsey stock, and will jump at this chance. Don't put the matter off. If you want foundation stock for a registered herd, now blood for an established herd, exhibition stock for the fall shows, or a bull to breed up a grade herd, come at once and make your selection. If you can't call, write your wants fully. But don't delay.

Write for Price List. DO IT TODAY.

Live Stock Profits

are directly dependent upon the general health of herds and flocks. Not all live stock diseases can be controlled or cured, a fact that justifies owners of livestock taking advantage of every proven method for eliminating possible risks.

PURITY BIOLOGICAL PRODUCTS

(not always cheapest but always best) offer the greatest protection against certain diseases.

Purity Blackleg Aggressin—Germ Free Vaccine—produced by the Kansas method. One treatment immunizes for life. Being germ-free its use will not introduce blackleg into healthy herds. Over 1,500,000 calves vaccinated without loss.

Purity Anti-Hog-Cholera Serum is the most extensively used in the world.

Purity Mixed Vaccine for Swine prevents Swine Plague and Necrotic Enteritis.

Purity Hemorrhagic Septicemia Vaccines for cattle and sheep prevent Hemorrhagic Septicemia and reduce losses in infected herds.

We are prepared to offer the highest degree of service—service that counts, and does not end with selling. Correspondence and consultation invited. Write, wire or phone.

PASTURE CONDITIONS AND HAY CROP.

We present below a summary of the condition of pasture and the hay crop in California by counties, grouped into zones. The estimated acreage of alfalfa by counties indicates in a general way the relative importance of each county in the production of alfalfa hay, although in many counties more or less alfalfa is pastured all or part of the season. A further decline in the condition of pastures is noted this month, particularly in valley counties. Some counties show an improved condition of hay. Should this occasion surprise, it must be remembered that in California August 1 conditions for all hay are based almost entirely on the condition of alfalfa, grain and other cultivated varieties of hay being practically eliminated from the calculations. In other words, the condition of alfalfa will generally indicate the condition of hay. These figures are of considerable value to the stockmen of our state, and are prepared by the Field Agents of the Bureau of Crop Estimates at San Francisco:

County	Pasture	Hay	Alfalfa	Alfalfa

VAN NUYS TO THE FRONT IN DAIRYING.

An active campaign has been started by W. P. Whitsett of Van Nuys with a view of attracting dairymen to that section. Mr. Whitsett has with him H. L. Boyer, a prominent dairy man of Fresno. Mr. Boyer was one of the organizers of the Delta Creamery in Imperial Valley, and still retains an interest in the large Boyer Dairy near Fresno.

The soil conditions in the Van Nuys section are ideal for the growing of alfalfa and there is an abundance of water for irrigation purposes.

Already there are several large dairies in this Valley. The Los Angeles Creamery Company has recently purchased 1040 acres and will commence the erection of large barns and buildings; also an ice cream plant.

While silage is an excellent feed for dairy stock, it should be combined with some leguminous feed, such as alfalfa. The leguminous material will tend to correct the deficiencies of the silage in dry matter, protein, and mineral constituents.

The ACME Cutter

PRODUCES SILAGE OF THE FINEST QUALITY.

It is convenient to operate. Its compact, rigid steel frame and 3-bearing cutter shaft practically eliminate vibration. This construction is found in no other cutter and makes the Acme the light-running power-saving machine it is.

The Acme is absolutely reliable and safe—the most durable feed cutter and silo filler made.

COMPARE THE ACME WITH OTHER CUTTERS. Send for our Acme Catalog. Study it. Your own good judgment will convince you that the best cutter to own and use is the Acme.

DE LAVAL DAIRY SUPPLY CO.

61 Beale St., San Francisco.

Van Nuys

Is fast becoming the dairy center of Southern California.

Why?

FIRST—On account of the abundance of aqueduct water.

SECOND—Silt soil free from alkali and hardpan.

THIRD—Less than one hour's distance by auto truck over fine boulevards, to the heart of Los Angeles markets.

FOURTH—Ideal climatic conditions.

FIFTH—Unsurpassed home, school and living conditions, all city conveniences.

Among the foremost dairymen of the Pacific Coast to recognize these facts is George Platt, President of the Los Angeles Creamery Co., who has recently purchased 1040 acres one mile north of Van Nuys and is now preparing to care for 1000 cows on this property.

ALFALFA RANCHES

Large and small. Improved and unimproved.

Most of this land is planted to alfalfa and in full production.

Diamond Bar Ranch Imports Durocs

(Written for the Pacific Rural Press.)

"The Diamond Bar Ranch at Spadra, California, has received the best carload of Durocs that ever crossed the Rockies, and they surely will be heard from in the western shows of 1919," said Fred De Vore, the Duroc Bulletin field man, referring to the recent purchase made by manager Walter T. Gatton, back in Nebraska. Mr. Gatton went back to the corn belt determined to secure the best animals of the breed, and he certainly knows how to pick the plums. Our Mr. McConnell recently visited the ranch, and he says that it is seldom pos-

sible to see such high quality and uniformity in one lot as is represented in this shipment.

The event was considered of enough importance back in the corn belt to justify decorating the car with a banner, as will be seen by the accompanying illustration, published by courtesy of the Duroc Bulletin. We also show a few of the yearling sows in the shipment. They certainly are corks, and with such foundation stock the Diamond Bar ranch should soon become one of the leading Duroc-Jersey Coast establishments.

Underhill Sale a Hampshire Conquest

(Written for the Pacific Rural Press.)

If anyone went to the Underhill sale at Santa Barbara, August 6, feeling that the Hamps were second-raters in hogdom, he certainly had his mind changed before he left. E. C. Stone, the live-wire secretary of the American Hampshire Association, was on hand to tell of nation-wide achievements of this popular breed, and local breeders were there galore to swap experiences and tell of the wonderful and economical gains made by the belted hog. They convinced many beginners of the merits of Hampshires, and as a result many new herds were started.

Man and nature combined to provide an ideal place for holding such a sale. The Ortega-Underhill rancho is a regular paradise, and under wide-spreading oaks is a natural amphitheater, in the center of which a salesring has been built, and directly back of this are the hog pens. A more fitting place for a sale could not be found.

A large crowd of critical and exacting buyers was on hand, but Col. Ord L. Leachman proved equal to the occasion, kept his 12-cylinder tongue working at full speed, and cried a sale which proved most satisfactory to both Mr. Underhill and the buyers. Some of the stuff was shipped, and from the East at a critical time, and did not show enough growth, but the good stock sold well and proved, not only that California is ready to take up Hampshire breeding in a big way, but that she wants to start with the best foundation stock obtainable.

The top of the sale was the two-year-old-sow, Martha 2nd, a big, stretchy, smooth animal bred to Rod. She brought \$300, going to V. R. Smith of Lindsay. The heaviest buyer was Walter Dupee of Edgemoor Farm, Santee, who secured five of the best animals for a total of \$885. H. F. Sheldon of Serena bought six head for \$640; C. G. Meiners of Ojai, four head for \$465; Peter Cook, Jr., of Rio Rista, four head for \$455; and C. E.

Shattuck of Los Angeles, three choice ones for \$410. Other buyers were: A. R. Glaizer, Kalaheo, Hawaii; University Farm, Davis; Nielsen Bros., Solvang; Pacheco Ranch, Martinez; Gwyn Thurmond, Saticoy; Rancho San Julian, Lompoc; C. H. Kellogg and L. A. Denker of Sanguis; Loring Farnam, Ojai; King G. Gillette and T. W. Andrews of Los Angeles; F. V. Gordon, Perris; Tom M. Bodger, Gardena; Dr. E. Avery Newton, Lankershim; Conejo Ranch, Newbury Park; F. J. Costello, Los Altos; Josh L. Wilson and son, Monrovia; and Jas. Marwick, A. L. O'Banion, Miguel Erro and Alfred Naylor, all of Santa Barbara.

The average for 63 head was \$110.32, which was very good for the first sale of its kind on the coast. Mr. Underhill is already planning for another bred sow sale to be held about the last of February, and it is expected that this average will be just about doubled. The stock will be of the same superb breeding, but a little better grown out.

LAST CALL FOR CARRUTHERS SALE.

Would you like to cheat yourself out of several hundred dollars? That's what you surely will do if you fail to attend the Carruthers sale of Berkshires at Live Oak Saturday, August 23. It will be different from the ordinary sale where mature and highly fitted hogs sell for high prices. Nearly all of this stock is young. You can buy the animals at low prices and they will grow into money for you.

Don't forget that Mr. Carruthers holds the coast record for the two highest averages at Berkshire sales. He is offering you the very best of his young stock—nothing reserved. You owe it to yourself to attend this sale and secure some of the bargains. It means a great deal to have Carruthers-bred Berkshires in your herd. This is your chance to get them. Col. Ord L. Leachman will cry the sale.

IT'S A SOURCE OF SATISFACTION

To know where to find the right kind of hogs when you want to buy.

KING JONES OVER

a son of the Great King Jones. Dam by Long King, out of a Big Bob sow. Weighs 600 lbs. at 14 mos. Stretchy, deep-bodied, well hammed and right up on his toes. He heads the best herd of strictly big-type sows in California.

Some extra good fall boars for sale. Cholera immune.

Immune Hogs Bring Better Prices

(Written for the Pacific Rural Press.)

"Are they cholera immune?" That's the first question asked by about nine out of every ten buyers of purebred hogs nowadays, and the breeder who cannot answer in the affirmative stands a mighty slim chance of making a sale. Prices of good stock are too high for breeders to run the risk of loss from cholera. And what's the use of running this risk anyway, when for a few cents a hog can be permanently immunized? Years ago the results were not always satisfactory, but rapid progress has been made during the last few years, and nowadays there are practically no

losses or even temporary setbacks. Nearly all of the leading purebred swine breeders of the State now have their herds immune, the latest to fall in line being J. Francis O'Connor of Castleview Ranch, Santa Rosa, W. S. Guilford at both Butte City Ranch and Monroeville Orchard, James Mills of Hamilton City, and W. M. Carruthers of Live Oak. J. L. Thatcher of Sacramento and Riverside immunized all of these herds with Purity serum. Mr. Thatcher recently opened an office in Sacramento and is already doing an extensive business with the purebred breeders as well as with the big feeders.

What Better Live Stock Means

(Written for the Pacific Rural Press.)

The following authentic incidents are cited by the United States Department of Agriculture in its "Better Sires—Better Stock" campaign to show what American farmers and stockmen may expect through improved methods of breeding and handling animals:

One Cow Equals Five.

A New Jersey boy was influenced to buy a high-grade cow for \$155. The cow on freshening gave 24 quarts of milk and kept it up for a long period. The father owned 5 cows—the average cows for the neighborhood. They were fresh in the spring. Their product did not equal the product of the cow owned by the son. Think of it—five times the labor and five times the feed, in comparison with one good cow.

High-Class Bully Beef.

An Oklahoma farmer had 2 registered Shorthorn yearling bulls that he priced at \$100 each for breeding purposes. A butcher saw the bulls, asked the price, and learned that they were registered and that it would take \$100 each to buy them. He bought them, killed them, and stated that they were the cheapest cattle he had bought for some time, because they cut the better kinds of beef, and more of it.

Valuable Stock—Valuable Offspring.

In several counties of North Carolina more pure-bred livestock has been purchased during the past year at the higher prices which have prevailed than in any other year. Hogs were never so high, yet hundreds of boys bought pure-bred pigs at high prices with the expectation of selling their offspring. Through the county agents many hundreds of pigs bred by the boys have been sold at good prices and this is stimulating the extension of pure-bred hogs.

Better Poultry—More Meat.

In a southern community, following the introduction of well-bred poultry for breeding, there was noticeable im-

provement in the size of the next generation of the fowls. The average weight of the birds marketed was 25 per cent greater than previously, according to the observation of an experienced poultry buyer.

DON'T MISS FRESNO POLAND-CHINA SALE.

Next Wednesday, August 20, one of the greatest lots of Poland-Chinas ever driven into a sales ring, will be offered by the Fresno Poland-China breeders at the Fresno Fair Grounds. Although this is the first sale of the association, the breeders are old-timers. Their stock will rank with the best in the State, and they are offering the tops of their herds in order to establish the reputation of Fresno county for profitable Polands.

The catalog shows a great line-up of sows and gilts, of royal breeding, bred to noted boars—some of them imported from the East at long prices. It will pay you to attend, or to send mail bids if you cannot be there. Dandy lunch at 11:30. Sale starts at 12:30.

EXTRA—As an additional feature of this sale a fine spring gilt will be given away to one of the guests. Everyone present will have a chance, and the one drawing the lucky number will be presented with a very choice specimen of the breed.

One of the most serious troubles with dairy cows is failure to breed regularly. Sometimes this failure is caused by accident, sometimes by disease. Whatever the cause, it interferes with the cow's value. A good cow should give birth to a calf every year. The buyer should make sure that the cow is not troubled with abortion, and that she is not hard to get with calf. Many herds have been ruined by the introduction of cows carrying the germs of contagious abortion.

P-R-O-F-I-T

That's what a sow or gilt will spell to the purchaser if bought at the

Fresno County Poland-China Sale

Seventeen of the leading breeders of the county have consigned the tops of their herds in order to make a big success of this inaugural sale. They are outstanding animals with both size and quality, and will suit your purse and purpose.

50 Bred Sows, Bred Gilts, Open Gilts

Wonderful brood matrons, sired by such noted boars as President, Jumbo's Equal, King's Big Bone Leader, Young Jumbo and Model Fellow. In their pedigrees you will find the most noted blood lines of the breed. You need this blood in your herd to put you to the front.

Among the eastern bred boars to which the sows will be bred are Vaughn Jones, a descendant of Gerstdale Jones; Hather's Big Bob, grandson of the world's champion; California Jumbo, a grandson of champion Giant Buster; and Blue Valley King, a son of King Big Bone.

Wednesday, Aug. 20th, Fair Grounds, Fresno

Come early and look over the stock. Free lunch at 11:30. Sale starts at 12:30. If you cannot attend, send mail bids to Thos. F. McConnell, field man for Pacific Rural Press, in care of the secretary. Field men will only bid on animals whose owners will ship on approval.

SPECIAL FEATURE—A fine spring gilt to be given away to the one drawing the lucky number. Everyone will have a chance.

BANK ON BERKSHIRES!

The hog you want is the one that comes the nearest to the pork-maker's ideal. He must produce the greatest amount of the highest quality of meat at the earliest age and the lowest cost. That's the Berkshire.

Carruthers Farms Sale 65 Head at Auction

This is your opportunity to get young stock from the herd that holds the coast record for the two top sales of Berkshires. All of our young stock will be offered. Nothing reserved. Many prospective prize-winners among them.

The females will include 12 under-one-year sows, and a junior yearling and a senior yearling good enough to win anywhere. Also 20 young sows 4 to 7 months old.

The boars will include 10 topky youngsters, 4 to 7 months old, that will make great herd headers for registered herds. Also 20 good young stock boars for grade herds.

SPECIAL ATTRACTIONS: Live Oak Champion, reserve grand champion of 1918, being defeated only by his sire. He is a two-year-old, out of one of the greatest daughters of Rival's Champion's Best. Also will sell the two-year-old Mayfield Superbus, by Superbus and out of one of Corsa's best sows.

Saturday, August 23rd

Sale will be held at the farm, three miles west of Live Oak, Sutter County, starting at 1 o'clock. Be sure to attend. You can't afford to miss this farmer's sale where high-class stock will go for moderate prices. Send for catalog.

The Dairy.

C. D. Hayworth, Modesto, has sold to A. H. Rona of Modesto, a registered Jersey bull out of a Register of Merit dam.

E. E. Greenough, Merced, recently sold to Mr. J. J. McMasters of Merced, the promising young Jersey bull Brownie's Marquis.

Leeman & Killgore, Ripon, have sold to Smith & Marchant of Ione, a 7-months-old bull calf that is a grandson of Tilly Alcartra.

Gotshall & Magruder of Ripon have purchased from R. L. Holmes, Modesto, all of his milking stock, consisting of 15 head of registered Holsteins.

Aaggia Acme of Riverside 2nd, owned by A. W. Morris & Sons, Woodland, has made a yearly record at the age of 12 years of 1,053 pounds butter from 20,354 pounds milk.

Harve De Wolf of Ripon has a daughter of Sir Skylark Ormsby Korn-dyke that has recently made a record of 21.28 pounds butter from 468 pounds milk with her second calf.

E. E. Greenough of Merced recently purchased two granddaughters of the ex-world's record cow, Goldie's Nehalem Beauty; also the young show bull, Fussy Fern's Noble 9th, which he will show at the State Fair.

At the Butler Jersey sale at Mt. Kiso, N. Y., 48 imported Jerseys sold for an average of \$3,308, which is Mt. Kiso, N. Y., 48 imported Jerseys sold for an average of \$3,308, which is a new record for the breed. This is the sale at which the bull Sybil's Gamboge brought \$65,000.

E. E. Freeman, Modesto, has sold to John Saxer of Modesto, a Holstein bull calf out of his 32-pound cow, Verona Hengerveld Glen Eva, and by Segis Pontiac De Kol Dutch. Mr. Freeman now has five cows on yearly test.

D. F. Conant of Rancho Santa Margarita, Modesto, has recently sold the Jersey cows, Hugo's St. Dinah and Lady Lurbigo, to J. D. Nash, Modesto. Also, he has sold the bulls Margery's Crackerjack of R. S. M. and Mamie's Owl's Laddie Boy of R. S. M. to J. R. Edgcomb of Ceres and Mr. Allen of Ceres.

Dr. H. W. Hand, owner of the Keep On herd of Register of Merit Jerseys at Orland, has secured the services of Walter C. Klein, formerly herdsman of the Ladd herd at Portland. Mr. Klein has had almost a lifelong experience with noted Jersey herds, and with such cattle as he has to work on in the Keep On herd some great records may be expected.

Arrangements are being made for a special delegation of California dairymen to attend the National Dairy Show at Chicago October 6-12. California should send a delegation to represent her second largest industry and all interested should communicate with Sam H. Greene, secretary California Dairy Council, 268 Market Street, San Francisco, who will be glad to give full information.

Leeman & Kilgore of Ripon have recently made records with their Holsteins as follows: Laura Netherlands Skylark, 27.57 pounds butter from 629.6 pounds milk; Miss Cornucopia Colantha, 24.12 pounds butter from 555.1 pounds milk in 7 days, and 96.55 pounds butter from 2,430 pounds milk in 30 days; Clothilde De Kol of Linwood, 24.78 pounds butter from 577.8 pounds milk in 7 days, and 100.13 pounds butter from 2376.2 pounds milk in 30 days.

Bridgford Company, Knightsen, have sold to H. H. Wallace of Crow's Landing, for \$1,500, the fine young bull, King Segis Hengerveld Inka Prilly, by King Segis Alcartra Prilly and out of Mercedes Inka Hengerveld, who has two records above 32 pounds. Mr. Wallace will use this bull on his grade Holsteins and the pleasing part is that he has been using pure-bred sires for a number of years and knows from experience that he can pay this amount for a high-class bull for a grade herd.

Beef Cattle.

Wm. Briggs, who formerly has a large herd of Herefords in Texas, has lately moved to Dixon where he will again raise white-faces, and he has already become identified with the Pacific Coast Hereford Breeders' Association. Secretary Bunting reports that Hereford herds are growing all the time in California, and he looks for many new members in the near future.

"That bull calf of Bemmerly's" continues to grow and improve at an astounding rate. At 11 months he weighed 1,150 pounds, and Mr. Bemmerly expects to have him weighing over 1,250 pounds when a year old. He was sired by New Era 2nd and out of a cow by Bonnie Brae 6th. The latter weighed 1,425 pounds when 16 months old, proving that quick-growing qualities can be transmitted.

Swine and Swinemen.

Ireland Ranch, Owensmouth, will hold a sale of 50 bred Duroc sows January 31.

H. C. Witherow, Greenwood Farm, Live Oak, has sold to Thos. Ashurst of Mendota, a young Duroc service boar by Johnson's Defender Jr.

Secretary Paine of the State Fair reports that over 1,000 hogs have been entered for this year's Fair. The quality is said to be excellent and there promises to be some lively competition.

Henry Schumann-Heink, son of the noted operatic singer and an officer on the battleship Oregon during the war, has purchased an 80-acre farm in the Natomas district. He will breed Duroc-Jerseys.

Geo. V. Beckman & Sons of Lodi have recently added to their large Po-

land-China herd a number of choice bred gilts. Their show stock is coming along fine and they expect to make a good exhibit at the fairs.

The J. S. Gibson Company of Williams get very satisfactory results in their market hog business by crossing Duroc-Jerseys on Berkshires. Mr. Gibson claims that the cross grows faster and finished better than the pure-breeds.

Jack Borge of Dos Palos is doing a large Duroc business among his neighbors and has recently made the fol-

lowing sales: Sam Dyer, 2 head; H. Gauger, 2; E. Maracini, 6; J. W. Thomas, 1; Leo W. Bello, 1; J. W. Baldwin, 1.

Ira L. Mason of Fowler is greatly pleased with the way his young boar, Smooth Leader, is coming on. He is all that his name indicates, and is putting on over 50 lbs. per month without forcing. Watch him at the fall shows.

The judging committee of the San Joaquin Poland-China Breeders' Association has made an excellent selec-

Pork Production

Perfect Maid

Sells at Fresno, August 20th

This wonderful sow is sired by the noted boar President, and out of Fruitful Maid. You can't beat that breeding anywhere. She is strictly big-type, and one of the largest sows to enter the sales-ring this season.

Bred for October farrow to Smooth Leader, he by King's Big Bone Leader, out of a granddaughter of Blue Valley. He traces back to the grand champion and greatest boars of the breed—Big Bone Leader, The Big Orphan, Smooth Price and Blue Valley. A great individual, too—gaining over 300 lbs. in 6 months in breeding condition.

Her Litter Will Put You on the Map

Be sure to put in a bid on this big sow. If you can't attend, send bid to Thos. F. McConnell, Pacific Rural Press field man, in care of W. C. Ficklin, Route A, Box 189, Fresno.

FOR SALE AT PRIVATE TREATY.

HADLEY BOY, a boar pig from Perfect Maid's February litter of 9 by Hanford Hadley. He is a corker—will surely make a great herd header.

Ira L. Mason

FOWLER,

CALIFORNIA

tion of young boars to go into the September 19 sale to be held at Lodi. Some great herd headers will be offered.

W. O. Pearson of Swineland Farms, Woodland, reports sales as follows: Two Tamworth boars to the Veteran's Home of California, Yountville; 2 Duroc-Jersey sows and boar to J. Schambler, Woodland; 1 Tamworth boar to Hite Robinson, Shively; 1 Tamworth boar to O. D. Elgan, Santa Rosa.

Lloyd & Tointon of Lloyton Farms, Santa Rosa, have sold to Dr. L. A. Danielson, a Yorkshire herd consisting of 3 bred sows, 2 bred gilts and the boar Lloyton King. The two gilts are out of the famous Nema 8th, with a litter of 20 to her credit. Dr. Danielson is a veterinary surgeon and dentist and has recently bought a ranch near Kenwood, Sonoma county, where he will establish his herd of Yorkshires.

Sheep.

R. H. Brotherton of San Francisco has just received a very fine yearling Hampshire ram from Idaho for his herd at his Los Altos ranch.

The Australian ram, Marshall Foch, has been sold for \$6,132. He goes to South Africa. This ram clipped 3 1/2 pounds of wool when 2 1/2 years old.

Ellenwood & Ramsay of Red Bluff have received 15 head of Corriedale sheep, purchased in New Zealand. The consignment consisted of 9 ewes and 6 rams from the greatest herds in that country. \$1,000 was paid for one yearling ram.

S. Guilford, owners. Special Notice: Second Farm Sale, Shorthorns; Shropshires; Berkshires; Ponies. Next sale April 17, 1920. All breeds.

Along the California Livestock Trail

(Written for Pacific Rural Press by Thos. F. McConnell.)

Winsor Ranch Feeding Methods.

The system of feeding hogs at Winsor Ranch, Bonita, is producing excellent results. Considerable attention is paid to cleanliness. All pens are cleaned at regular intervals; feed is not allowed to get stale or sour, and by the use of a system of their own the drinking water is always clean and fresh.

The hogs are kept in dry lots at night and on alfalfa pasture during the day. Both dry and pasture lots have plenty of fresh, clean water at all times, but mud wallows are discouraged. Grain in the form of slop is fed in the dry lots night and morning, and is ready in the troughs at night, so that bringing in the hogs at that time is merely a matter of opening the pasture lot gates and the hogs do the rest. They are fed another ration of grain before being turned out in the morning.

The dry lots are 25x150 feet and the pasture lots contain one-third of an acre each. All lots open into a system of 16-foot alleyways that make it easy to shift and sort the hogs. Everything is so arranged that the maximum results can be obtained with the minimum of labor. Cement is used for feeding floors and surrounding all water troughs; also in the farrowing pens, where the guard rails are gas pipes imbedded in the floor. Shavings are used for bedding in the farrowing pens with the very best results.

Brown Breeds Good Ones.

Grant A. Brown, the breeder of registered Jerseys at El Monte, believes in raising as much feed as possible for his cows. He double-crops for silage, growing Indian corn in the summer and oats and vetch in the winter. Mr. Brown believes that corn makes the best silage, but finds oats and vetch a very good feed readily eaten by the cows. Silver Birdie, an 18-year-old cow in this herd, has the edge on appearance of many younger cows. She is a descendant of Brown Bessie, the cow that made a great record at the Chicago World's Fair. The October bull calf, Shylock's Monte, is a youngster of great promise. He should equal his sire, Lady Shylock's Financier, in conformation, and as he is out of the great cow, Fernie's Imperial Lady, he seems destined to become a great sire.

Hampshires at Llano Vista.

Here at Llano Vista Ranch, Perris, we find one of the premier Hampshire swine breeding establishments of California. Mr. Langdon, the member of the firm in charge, is a great believer in barley and alfalfa for growing hogs. He says that with ground barley and alfalfa meal, ground from his own alfalfa, he can grow Hampshires to 230 or 240 pounds in six months for 10c per pound, counting all costs and figuring at 3½c per pound.

Mr. Langdon grinds his own barley and alfalfa, and prepares it by mixing enough in the morning for the following night and morning, and wetting it thoroughly. This soaks half of it 12 hours and the remaining half 24 hours. In the winter time it is sometimes soaked even longer. The proportions used are 50 pounds of alfalfa to 75 pounds of barley.

The senior herd sire, Gold Mine, is 5 years old, but a very vigorous, active fellow and a great sire. One sow is so popular that customers will take her pigs as soon as weaned at from \$25 to \$350 each. Mr. Gordon has only been able to keep one of her gilts for himself. She certainly is a good one and at 8 weeks weighed 72 pounds.

The popularity of the Hampshire hog is increasing rapidly in California as proved by the fact that Gordon & Langdon have sold \$14,000 worth during the past year. Mr. Langdon says that they can be put on the market for less money than any other breed; that they are better rustlers and kill cleaner with less waste.

Lark Meadow Ranch.

Geo. E. Stingle of El Monte raises Berkshires and very good ones. To begin with he has the very best he can buy, and then every pig that shows inferiority in any way is eliminated from the breeding herd as soon as weaned. Then those that are left are registered immediately so that when anyone buys a pig at this place it is already registered and only needs to be transferred and the transaction is complete.

A recent addition to the herd is a boar, Escalon Majestic, from the celebrated herd of A. B. Humphrey, and bred to Mr. Stingle's sows should produce something fine.

Cox and His Cows.

Russell H. Cox of Escondido for years devoted his efforts to raising standard-bred trotting horses, but as the demand fell off he turned his attention to registered Guernseys. He used to breed them back in Pennsylvania and believes that his father brought the first registered Guernsey cattle to California. Mr. Cox now has 13 head, mostly young stock, many being due to freshen this fall. That he believes in the best is proved by the recent purchase of a young herd bull from Edgemoor Farms for \$1,000. The bull's two nearest dams average 846.5 pounds butterfat in a year. Watch him come to the front.

Christiansen's Unique Feeding Methods.

The arrangement of the feeding floors, troughs and water devices at the Poland-China breeding establishment of H. Christiansen, Riverside, is rather unique and was worked out by Mr. Christiansen himself. The floor, feed trough and watercups are of cement, and in one solid block with no crevices in which feed can accumulate. The drinking places or cups are oval depressions in a solid block of cement 6 or 8 inches high and 12 inches wide, extending the full width of the feeding floor and placed under the partition between two pens. The oval depressions in the top of this long block of cement are placed crosswise and are five in number, connected one to another by an open slot extending the full length of what would be a trough if it were hollowed out. Instead, it is simply a series of five oval cups plenty large enough for a hog to drink out of, but not large enough for any pig to get into. The water is supplied from a depression in an extension of this block of cement on the outside of the pen and is governed by a float beyond reach of the hogs. The plan seems to work to perfection.

CHANGE SHEEP PASTURES OFTEN.

Unless sheep are kept in a healthy condition they will not pay. The health question is chiefly one of internal parasites, and of these the stomach worm is the most troublesome. Fortunately, the trouble can be controlled in a practical way, and the methods of prevention are exactly in line with the practices that result in the most economical production.

The basis of success in the farm sheep business is in the frequency of changing to pastures which have not had any opportunity to become infected with stomach worms by older sheep. These frequent changes are particularly necessary during the stay of the young lambs upon the farm. The older sheep are less susceptible to the effects of the infection, though danger of their being injured is not to be overlooked.

The plan of frequent changes to fresh feed can be adapted to the most economical systems of using high-priced land in the rotations of crops to produce feed and forage for other kinds of livestock. The important part is to change the feed frequently enough so that no part of the flock will be upon land that has previously carried sheep during the same year. With this simple precaution the dreaded stomach worms will give little trouble.

Livestock Queries and Replies

Cow Has Gastro Intestinal Catarrh.

To the Editor: I have a cow that freshened in March, but five days afterward she bloated from clover. I got her straightened out, but about four weeks later she began to shrink on her flow of milk and within a week had dropped from 3 gallons to 2 quarts. I drenched her, but this gave only temporary relief. She does not eat or drink much and seems a little bloated most of the time. What can I do for her?—H. C. L., Healdsburg.

(Answered by Dr. E. J. Creely, San Francisco.)

Your cow has gastro intestinal catarrh, which is a condition brought about by the eating of fermentable food. Change the feed and feed lightly of nourishing, easily digested foods, such as freshly mown meadow grass or tender hay, the idea being to stimulate the stomach movement more than to satisfy the appetite. At the same time encourage thirst by giving salted gruel or whey, or if she refuses this keep salt before her constantly. The movements of the stomach and intestines may be stimulated by hand-rubbing the under surface of the abdomen and especially the left side of the flank in the region of the paunch. Occasionally give a mild physic of Glauber or Epsom salts in combination with mucilaginous foods, or with flaxseed tea (2 or 3 quarts at a time), divided into three doses and given at three-hour intervals. Two ounces of turpentine in one pint of raw linseed oil may also be given to reduce fermentation—once daily. If this is not sufficient it may be necessary to give an enema of lukewarm Castile soap water or salt and water—a teaspoon of salt to each pint of lukewarm water.

Temperature of Animals.

What are the usual temperatures of farm animals and what shall we do to tell whether or not they have a fever?—E. J. K., Armona.

(Answered by the Live Stock Editor.)

Horses about 100 degrees, cattle 100.5 to 102, hogs 102 to 103, sheep 102 to 104. Usually young animals have a higher temperature than older ones, and excitement, slight digestive disturbances or extreme cold or heat will affect the temperature. A regular fever thermometer for veterinary use is a handy thing for every rancher to possess. The thermometer is inserted into the rectum and left there for two or three minutes. A horse with a temperature of 103, a cow with 104, a hog with 106, or a sheep with 107 denotes illness. Do not give animals medicine to bring down the fever. A high temperature is Nature's way of combatting the growth and multiplication of bacteria, and it is better to leave this alone. A thermometer is a valuable friend and gives warning when to summon a veterinarian at the very beginning of a disease.

Calves Have Ringworm.

To the Editor: Several of my calves have sores about their eyes, head and neck, which are small at first but gradually enlarge. They are dry, of a whitish color and somewhat scaly. I used a salve and the scales came off, leaving the skin a fiery red. What is the trouble and how can it be cured?—C. B., Marysville.

(Answered by the Live Stock Editor.)

Your calves have ringworm, which is caused by mold growing on the skin and through the hairs. It is transmissible, so the calves having it should be isolated. Scrub the diseased spots with soap and water and a stiff bristled brush. After the scabs have been removed, apply an iodine ointment or touch the spots with tincture of iodine.

Horse with Indigestion.

My horse got very poor on the range. Since then we have fed him barley hay and all the alfalfa meal he would eat, in addition to pasture during the day. He eats well and has gained a little, but seems very weak

and drags his hind feet.—I. A. B., Santa Margarita.

(Answered by Dr. E. J. Creely, San Francisco.)

Evidently your horse has indigestion, due to his not being able to masticate his food, and the staggering gait would result from this. If you examine the feces you probably will find that a great deal of his food passes through him unmastered. Have a competent veterinarian float his teeth. Mix the following powder and give a teaspoon in the grain twice a day: Bicarbonate of soda, 4 ounces; pulverized nux vomica, 2 ounces; pulverized ginger, 4 ounces; pulverized gentian, 3 ounces; pulverized and dried iron sulphate, 2 ounces.

Thos. E. Wilson, Chicago packer, has been elected president of the Institute of American Meat Packers recently organized "to co-operate with the government, foster domestic and foreign trade, and promote mutual improvement along lines connected with the meat packing industry."

When to Breed Beef Heifers

(Written for Pacific Rural Press by R. H. Whitten.)

Should heifers of the beef breeds calve for the first time when from 24 to 27 months old, or is it better to carry them along and not have them calve until they are three years old?

For four years tests have been carried on at the Kansas Agricultural College, and they show that when heifers are crowded by heavy feeding through the first two winters the re-

sults will be satisfactory if they are bred to calve at from 24 to 27 months, but when they are wintered on roughage they cannot be bred profitably to calve at these ages. Only 40 per cent of the heifers fed roughage alone dropped calves at two years old; most of these had difficulty in calving, the loss of calves was great, and the growth of the heifers was noticeably retarded by early breeding. The heavily fed heifers that were given concentrates during the winter dropped a normal percentage of fair-sized calves, and the results were generally satisfactory.

Of those bred to calve when 3 years old, the ones fed heavily on corn, cottonseed meal and alfalfa were not enough larger and did not produce calves enough better than those getting only roughage to pay for the extra feed. It had cost \$32 more a head to bring these cows to producing age than the more practicable plan of roughing them through the winter, and there was no perceptible difference in the value of the calves.

In summing up the results it was advised that in general farmers should crowd their heifers by heavy feeding and breed them to calve at 2 years, or rough them through the winters and

Stock Farm, Taylorsville and Santa Clara, believes that the Kansas recommendations are all right for California. With purebred Herefords the Association does not permit the recording of calves that are dropped before their dams are 27 months old. Mr. Barngrover thinks this a good ruling, and finds it safer to have heifers calve during the early summer months than in the early spring. The heifers have a chance to run on grass before calving, which puts them in better physical condition for the ordeal, besides allowing the extra three months for growth. On the other hand, a late calf will come into the winter smaller and will require extra attention and feed to guard against its becoming stunted. With purebred cattle that are kept growing from babyhood, there is more danger of developing non-breeders when carried to calve at 3 years than when bred younger.

Jas. McDonnell of Ormondale Ranch, Redwood City, believes that no set rules can be laid down. He says that heifers develop quicker in California than in the eastern states, and that a heifer well raised is fit to breed at from 18 to 20 months, while one that has been made to rough it all her life and has developed slowly should not be bred until she is 30 months old.

John A. Bunting of Mission Hereford Farm, Mission San Jose, says we have such wonderful winters that he believes the average California cattle-

"With better breeding and feeding methods we should be able to develop beef heifers in California so that they can safely be bred to calve at 24 to 27 months, instead of the customary 36 months, thus saving time and increasing profits."

breed them to calve at 3 years.

But how about California? Are conditions so nearly the same that the same advice will apply, or will our longer grazing season enable heifers to develop sufficiently without heavy winter feeding so that they can be bred to calve at 2 years?

Dr. H. M. Elberg of Roselawn Stock Farm, Woodland, says that as a rule, California cattlemen do not pay enough attention to winter feeding, as in most sections cattle can run the year through on the ranges, and while they will make a living, they will not mature as soon as when they are fed and protected during the winter. He says that at the present time the average beef heifer cannot safely be bred to calve at two years, but believes that with better breeding and feeding facilities we should be able to develop heifers so as to have them calve at 24 to 27 months instead of 36. Dr. Elberg's registered Short-horns are winter fed and always kept in thrifty condition, so he breeds his heifers to calve at 24 to 27 months of age.

C. N. Hawkins, of Pacheco Ranch, Hollister, believes that on the average California range heifers do not get as good treatment in the late fall and early winter as they do with ordinary roughing in the East, and consequently are not well enough matured to calve at 2 years. Another point he mentions is that to have a 2-year-old heifer calve safely she must drop her calf fairly late in the spring, and she is compelled to suckle the calf for some time on dry feed, which not only stunts her growth and that of her calf, but so reduces her condition that she is likely to fail to breed that season. Many poorly developed heifers calving at 2 years miss at 3 years, and have to be carried over or sold for beef. But calving at 3 years, they come in early, keep in good flesh, breed in good time for the following season, and wean their calves early in the summer.

H. M. Barngrover, of Veramont

men neglects his stock and lets them rough it when he ought to be feeding them. He says that it pays to have a heifer well grown out before she calves, and even if this means one less calf from her during her lifetime, the calves she does have will be enough better to more than make up. The mother will never be the cow she should be if she calves when not well developed. Mr. Bunting breeds heifers to calve at 27 months when they are well grown, but if one has had a hard time of it he holds her longer.

H. H. Gable, of Diamond G Ranch, Esparto, has his Hereford heifers come through the winter in such good shape that they are bred to calve at two years, and he cannot see that the calves are less thrifty than those from older mothers. The element of risk is a little greater, but the returns come a year earlier. Mr. Gable believes that, with milder winters and longer grazing season, we can more safely breed our heifers to calve at two years than in the East, yet for the average California case, where heifers have had to rough it, he is of the opinion that it is better to have heifers calve at three years, as it results in larger cows and more thrifty calves.

E. A. Noyes of Bar N Ranches, Sutter, breeds his registered Herefords to drop calves at 27 months so that the calves can be registered, but with unregistered stock he believes that when heifers are reasonably well cared for until 15 or 16 months old, they are sufficiently developed to be bred, and he breeds all of his own grades to calve at 24 to 26 months of age. He finds that he does not have as many losses when heifers drop their calves early, as when they are carried along for late calving they take on too much flesh.

So here we have, not a lot of theories, but the actual experiences of many of the leading California breeders, and from their methods young breeders ought to be able to determine what is best for their individual cases.

Conducted by R. H. Whitten.

SKILFUL CULLING PAYS BIG DIVIDENDS.

[By Prof. J. L. Dougherty, University Farm, Davis.]

Every poultry raiser understands that intelligent culling of unprofitable layers will increase the average productivity of his flock. But are you putting that knowledge into practice? Are you reaping the financial benefits of intelligent culling? Here are the twelve points of successful culling:

1. Between July 1st and October 1st is one of the best times to cull laying flocks. The sooner the better. Culling slacker hens saves feed.

2. A hen must have a healthy, vigorous body to be able to lay heavily. Fowls with weak constitutions cannot stand up under the strain of heavy egg production. They should be active and good rustlers.

3. A well developed comb of good color, short strong beak, blocky head, bright eye, well proportioned body, and clean-cut action are indications of a vigorous fowl.

4. The size of the comb in relation to the normal size for that breed is correlated with a hen's egg laying ability, so that the size of the comb is one indication of ability to lay. The larger the comb the better layer a hen should be, other points being equal. Abnormally large combs, however, are not desirable.

5. The better the layer the later she should molt. The molting of a fowl before September 1st is one indication of a rather poor layer.

6. Pubic bones should be thin, fairly straight, somewhat flexible in a pullet, but thicker on ends and more rigid as she gets older. Those hens, the ends of whose pubic bones thicken very slowly and so remain relatively thin from year to year, should be better layers than hens whose pubic bones thicken rapidly on the ends, other points being equal. Therefore the relative straightness of the pubic bones and thinness of the ends of these bones are valuable indications of egg-laying capacity.

7. The distance between the rear of keel bone and the ends of pubic bones is a measurement of abdominal capacity. Hens measuring less than the thickness of three fingers are usually culls. Laying hens need good sized abdomens in which to manufacture a good yield of eggs per year.

During the laying period the distance between pubic bones increases to the thickness of two fingers or better to allow of free passage of eggs. When laying stops the ends of the pubic bones may come closer together again.

9. In the laying period the abdomen becomes fuller and the vent more dilated, due to stretching of the abdominal tissues to allow for the increase in size of the egg organs while active. The abdomen should, however, remain flexible to the touch. The accumulation of excess fat in the abdomen crowds egg organs, interferes with and checks production, and is indicated by the abdomen losing its flexibility and becoming hard to the touch.

10. A hen in good laying condition should be in good flesh, but not over-fat as shown by a hard abdomen and too plump breast.

11. In yellow shanked varieties, good layers "lay out" the yellow color on beak, earlobes, vent and shanks as the laying season goes on, so that the comparative shades of yellow of these parts in different fowls after July 1st are an excellent indication of their egg-laying performance. Pale shanks and beaks after July 1st indicate poor layers, whereas bright yellow shanks and beaks indicate culls.

12. The more different indications that are used in culling poor layers and selecting extra good layers, the more accurate the work will be. Experience should soon enable one to cull laying flocks with surprising accuracy. Are you getting that experience? Remember that skilful culling pays big dividends.

INCREASE WEIGHT BY GRADING UP.

The average farmer of today knows that it pays him to grade up his herds, and he has his purebred bull, boar and ram. But how many carry that practice to their poultry flocks? "Grading up" is just as applicable for the betterment of flocks, and mongrel flocks respond rapidly to the introduction of standard-bred males.

Perhaps you would like to have a well bred flock, but hesitate to make any change because you don't like to sacrifice the fowls on hand in order to purchase quality birds. If so, you need not give up the attempt, for by the use of carefully selected standard-bred males you may grade up your flock so that in three or four generations you will have birds of superior egg and meat producing qualities.

Specialists of the United States Department of Agriculture have obtained some interesting results in poultry breeding work at the Government Experimental Farm, Beltsville, Md., where they have mated mongrel hens of unknown lineage with standard-bred males. Up to the present the particular purposes of these investigations have been to increase the size and weight as well as to improve the uniformity of type of the progeny. The study will be continued to cover egg production and the transmission and improvement of other hen characteristics.

Standard-bred White Plymouth Rock males were crossed with mongrel hens which weighed only 4.33 pounds apiece. The first generation progeny of this union at the same age had an average weight of 5.68 pounds apiece, while the fowls composing the second generation weighed an average of 5.98 pounds a piece at the same age, and those of the third generation 6.49 pounds apiece. The gain due to increased size and meat-making qualities which resulted the first year from the crossing work amounted to 1.35 pounds per bird. Naturally the greatest increase came during the first step in the up-grading work when the standard-bred male was mated with a mongrel hen. The increase resulting from the mating of another standard-bred male of the same breed with the pullet of the above cross was not so great, amounting to 0.3 of a pound, while the gain of the third year's investigations totaled 0.51 of a pound. The total gain as shown by these three generations of intensive up-grading work amounted to 2.16 pounds a bird.

From the standpoint of meat production this up-grading work should be extremely profitable to the average farmer, as the investigations show conclusively that the introduction of superior blood into the flock by the utilization of a standard-bred male increases the meat-producing and size-increasing ability of the progeny. If the progeny be a grade hen, united with a standard-bred male, will weigh 1½ to 2 pounds more at market time than with the same aged offspring of a mongrel hen and a common male, it should be easy to convince every farmer that it will be more profitable for him to keep better blood in his flock.

PAYS TO FEED HENS ON RANGE.

Does it pay to feed hens on range during the summer months? This question was asked by Mrs. Houck McHenry, whose poultry flock had extensive range. Her theory was that the birds should scratch for a living during warm weather and should not be fed at all, but from a flock of more than 100 Barred Rock hens she got only from 1 to 5 eggs a day during the latter part of May and the early part of June. Also, many of these eggs had green whites and were considered unfit for food.

So Mrs. McHenry called upon the County Farm Adviser, who recommended that the hens be given both

grain and mash in addition to all other feed secured on range. The first day after the new plan was begun she got 8 eggs, the next day 15. In one week she was getting 52 eggs and in less than three weeks she got as many as 90 eggs in a day with an average of 70. How is that compared with the average of from 1 to 5 a day before the feeding began? The feed paid for itself a dozen times over. It will in your flock, too.

SUMMER CARE OF RABBITS.

Improper feeding is responsible for more grief to the rabbit raiser than anything else, and especially during warm weather. Those who have cows, hogs or poultry know that heating foods should be reduced or eliminated during the summer months, but when it comes to rabbits they go on feeding the same feeds right through the year, and then wonder why the poor little animals do not thrive.

Rabbits are fed hay, greens and grain. The grain is usually barley, and barley is very heating. It should be cut down during the summer months; in fact, some breeders cut it out entirely. If the rabbits are valuable and it is not necessary to keep the feeding cost to the minimum, rolled oats can be substituted with excellent results. Oats make muscle and bone and are not heating like barley.

As the grain is reduced the green feed should be increased. Vegetables, weeds, lawn grass and other greens should be fed very liberally. Don't cut out the hay, as it supplies the roughage that the rabbits require to help digestion. Be particular about the drinking water and see that it is cool and clean.

If a rabbit is suffering from the heat, dampen—don't sop—a grain sack and lay it inside the hutch. If this is not sufficient, hang moistened sacks around the hutch and occasionally sprinkle the ground underneath. Remember, though, that rabbits do not thrive in damp weather, so don't over do.

Shade, of course, should be provided. There is nothing quite so good as the natural shade from trees, but sacks sewed together and put over the hutches, high enough to allow a circulation of air underneath, are a great help.

Clean the hutches at least twice a week, and end up by spraying well with a good disinfectant. Be sure to have it reach all corners and cracks. The rabbits enjoy lying about during the hot days, and you can make their enjoyment far keener by giving them clean quarters in which to stretch out.

A little thought and care during the summer months will bring in more dollars and keep up the vigor of your stock.

GOOD-NIGHT DEPLUMING MITE!

This is the time of the year when fowls become infested by depulmating mites, which live at the base of the feathers, causing an intense itching and producing a disease known as mange, or depulmating scabies. The mites live around the quills of the plumage, and by their gnawing of the quill, cause the feather to break off. The trouble generally begins at the rump, and spreads to the head and neck, back, thighs and breast. Around the stumps of the lost feathers and at the ends of the quills of feathers near the bare spots will be found masses of scabs and crusts. In this way the condition can easily be distinguished from molting or the vice of feather pulling. However, the irritation caused by mites leads fowls to pull out their feathers, and they often acquire the habit of feather pulling, attacking the plumage of other birds as well as their own.

The mites causing the disease are introduced into the poultry yard by affected fowls and spread rapidly from fowl to fowl, finally infesting nearly all birds in the flock. On this account care should be taken not to introduce infested birds, and if the disease appears the affected birds should be isolated at once. The disease usually begins in the spring, is

most active in warm weather, and disappears in winter.

The affected spots of the skin from which the feathers have dropped out should be anointed for some distance around them with an ointment made of 1 part flowers of sulphur and 4 parts vaseline or lard. Or a carbolyzed vaseline may be used. If a liquid preparation is preferred use 1 ounce of Peruvian balsam to 13 ounces of alcohol. Apply the preparation selected twice a week until the disease is cured.

In an extreme case it may be well to dip the bird in a Zenoleum or sheep dip solution. The bird is held by the shanks and wings, and is wet all over by immersion in the lukewarm solution. Either do the work in a warm room or select a warm, sunny day so that the bird will not suffer from the severe wetting. Repeat in a week.

Poultry Breeders' Directory

MOST FALL CHICKS ALREADY BOOKED, yet hundreds open most weeks, reduced, in each of seven popular breeds. Clearing customers, \$5.00 yearly. 200-290 egg strain. Large, vigorous winter layers. Half chicks go to former customers. Doubling our 70,000 hatching capacity. Returned thousands of dollars for chicks we couldn't supply. **FEW HUNDRED BREEDING HENS, MALES,** laying younger pullets, going rapidly—50c to \$2.00 under price. Valuable circular with proof free. J. Beeson, Pasadena, Calif.

WE SOLD OVER 800,000 White Leghorn baby chicks to satisfied customers since January 1. Buy chicks now, and sell Fall and Winter broilers at fancy prices. Pullets will make fine early Spring layers. Price per 100: July, \$14.00; August, \$15.00. Safe arrival of full count live chicks guaranteed. **THE PIONEER HATCHERY,** 408 SIXTH STREET, PETALUMA, CAL.

PEERLESS WHITE WYANDOTTES—Our 200-egg strain, bred for years for show qualities and high egg production. 50 cockerels—100 pullets for sale. Trios and mated yards. Eggs for hatching. Catalogue free. J. W. Atkinson, Box 8, 130 Willard St., San Jose, California.

S. C. WHITE LEGHORN CHICKS—by the 100 or 1000 from A-1 Hoganized and Trapped stock. Won 1st, 2nd and Special (Utility Class), Oakland and Modesto. Order early for Fall and Spring delivery. A. O. & P. M. Forster, 2918 Ohio St., Berkeley, Cal.

GET BABY CHICKS NOW—Write for free booklet on fall chicks. See why they pay. Several varieties very week. Only good, strong youngsters shipped. **Stubbs Poultry Ranch and Hatchery,** Box 67, Palo Alto.

DON'T DELAY GETTING NEW BLOOD—Greatest profit next year and all found in strains laying 200-290 eggs score of generations back. Hens reduced. Makes half price. Study our big advertisement elsewhere. J. Beeson, Pasadena.

CAPON SPECIALIST—Make capons of your useless cockerels. Learn how at the State Fair and add profit, fine meat and infertile eggs to the poultry industry. Mrs. H. Ament, 423 Kerkhoff Bldg., Los Angeles, Cal.

FALL BABY CHICKS—Rocks, Reds, and White Leghorns; choice stock. Place your order in advance to insure prompt attention. **Santa Clara Valley Hatchery,** San Jose, Cal.

BARRED PLYMOUTH ROCKS—Nothing better in poultry. Prize-winners and wonderful layers. Choice stock for sale. Chas. H. Vadden, Box 3, Los Gatos, Calif.

S. C. RHODE ISLAND RED cockerels, February hatch, breeding pens. Improve your color and egg capacity. Wm. Larm, 3915 39th Ave., Fruitvale, Calif.

EASTMAN'S BRED TO LAY—Hoganized and trapped Barred Poultry Rocks. September chicks. Fairmead Poultry Farm, Fairmead, Calif.

FALL BABY CHICKS from our large heavy-laying S. C. White Leghorns. Send for prices. **Tupman Poultry Farm,** Box 7A, Ceres, Calif.

GOLDCROFT BUFF ORPINGTONS—Winners San Jose show. Choice stock for sale. Samuel Abrams, Los Altos, Calif.

CHICKENS, DUCKS, GEESE, GUINEAS, Pea Fowl, Pigeons. Wm. A. French, 545 W. Park St., Stockton, California, Stamps.

BUFF ORPINGTONS, BUFF DUCKS, BOURBON RED TURKEYS—The Ferris Ranch. Rt. 2, Box 144D, Pomona, California.

BRONZE TURKEYS—Albert M. Hart, Clements, Calif.

Rabbits.

RAISE RABBITS—Most profitable and popular small animal in America. Big demand. Clean, fascinating work. Send 10c for copy of leading rabbit magazine and our Rabbit Books, P. N. 5. Gilmore's Rabbit Farm, Santa Barbara, Calif.

NEW ZEALAND REDS—First class utility does bred, \$5.00 each. Young does, \$2.50 each. F. R. Caldwell, Broadmoor, San Leandro.

THE HOME CIRCLE

THE YOUNG EARTH.

The fields were parched with summer's heat
The life and green from swamps had fled;

The dry grass crunched beneath the feet,
And August leaves dropped stiff and dead.

Then light south winds 'cross wood and shore

Brought cooling clouds and slow, sweet rain,

And hills and crops were new once more,

And grasses greened on march and plain.

So swift the magic sent its spell
Through burning corn and pastures dumb,

'Twas clear the world had rested well
Against the time when rain should come.

So virile is this earth of brawn,
So quick with life its soil is stung,
A million years have come and gone
And still it rises green and young.

—Liberty H. Bailey.

RUFUS ADOLPHUS' RED SHOES.

"We'll call ourselves the D. R. L.'s," Polly Anne said with decision. "That will be such a nice, mysterious name, Sarah, because nobody in all Sharon will know what it stands for. You see we might be the Daughters of Royal Line, or the Daring, Roaring Lions, or Dainty Red Leaves—anything but the Dolls' Rescuing League."

Polly Anne and Sarah sat on the fence that shut in the wood lot back of the Tibbet's little brown house. It was late fall. Red and yellow leaves, like flaming sparks of fire, drifted down from the sky, and the air was full of pleasant odors,—the smell of bonfires and over-ripe apples, the pungent perfume of late asters and pumpkins that lay, golden, on the ground in the next field. The cold wind that blew across from the woods

A cup of fine rich tea, full of the real tea-flavor, costs less than a cup of common tea—a pound makes so many more cups.

Now this is either so or not so; and you can prove it at our expense.

Get Schilling Tea at your grocer's. Serve it a half-dozen times. If you don't find it's the fine economical tea we say it is, tell your grocer "I want my money back" and then use the rest of the tea.

There are four flavors of Schilling Tea—Japan, Ceylon, India, Oolong, English Breakfast. All one quality. In parchment-lined moisture-proof packages. At grocers everywhere.

A Schilling & Co San Francisco

made a whistling sound in the corn-stalks; and, as it swept over the wood lot, it brought with it a round, hard hickory nut that rolled and bumped across the ground and stopped by the fence.

Polly Anne jumped down from her perch and picked up the nut, holding it in the hollow of one brown little hand.

"You know we will really be that, Sarah. No one would know that this is a doll."

Polly Anne fondled the hickory nut, and pointed to its wrinkled shell and the hard knob on one end.

"But is it a doll," Polly Anne continued.
